German inland shipping in 1937 included 5,375 vessels moving under their own power and totalling 528,000 tons; and 12,488 canal boats and other vessels without power, totalling 5,835,000 tons. High-seas shipping included 3,579 vessels with a total registered net tonnage of 2,238,000. In Jan. 1938, as a result of the year-long trial of Arnold Bernstein for alleged evasion of German foreign exchange laws, it appeared that his two lines, the Bernstein and Red Star Lines would pass under German control.

By the end of 1937 Germany had completed the construction of 2,000km. (1,243mi.) of the new automobile highway network (*Reichsautobahn*). This completes about a third of the highways projected. They are magnificent cement two-way roads, separated by a grass strip, and without any crossings; intersecting roads use bridges or underpasses. The highways have regard for scenic beauty, and are of great economic and strategic importance. They have cost nearly 2,000,000,000 marks (nearly \$800,000,000), and have given employment to 250,000 workers, half directly and half indirectly.

The total number of motor vehicles on Dec. 31, 1937, was over 3,000,000, including 1,430,687 motor cycles, 1,216,170 passenger cars, 352,500 trucks, 18,033 busses, and 67,100 other motor vehicles.

The Post Office statistics for the year ending March 31, 1937, with the per cent of increase since 1932 in parentheses, are: letters carried, over 6,000,000,000 (29); total of postal checks, 141,000,000 (37); telephones, 3,431,100 (16); telegrams, 21,000,000; radio receiving sets, 8,511,959. The receipts were 1,886,000,000 marks and the expenditures 1,963,000,000.

**Agriculture, Manufactures and Mining.**—Germany's grain harvests were medium or poor in 1936 and 1937, causing some food and fodder shortage. This was partly offset by the 1937 potato crop which reached an all-time high record. The latest available figures for the principal crops in thousands of metric tons (not including the Saar Territory) are:

	Rye	Wheat	Barley	Oats	Potatoes	Sugar-Beets	Fodder Beets
1932 . . . . .	8,303	5,003	3,214	6,650	47,016	7,875	34,486
1933 . . . . .	8,727	5,604	3,468	6,952	44,971	8,578	30,716
1934 . . . . .	7,607	4,532	3,203	5,452	49,780	10,394	33,804
1935 . . . . .	7,478	4,607	3,387	5,385	41,015	10,567	34,711
1936 . . . . .	7,386	4,420	3,399	5,918	46,323	12,095	37,826

Owing to Germany's lack of gold and foreign exchange with which to buy raw materials, Hitler established in 1936 the Four-Year Plan. Its purpose is to develop Germany's own resources and

furnish substitutes for goods and raw materials formerly imported. The "Hermann Göring Reich Stock Company for Ore Mining and Iron Smelting" for the mining of low grade iron ore in the Salzgitter district in Central Germany near Hanover is expected to produce a million tons of crude steel by 1940 when the plant is completed. Synthetic gasoline, rubber, soap, textiles partly of wood products, and other substitute (*Ersatz*) products are already being successfully developed, but at a high cost; they demand much labour and invested capital furnished in part by the State, and threaten the ultimate exhaustion of Germany's forest and mineral resources. Germany's principal mineral and manufactured products were as follows in metric tons:

	1933	1934	1935	1936
Coal . . . . .	109,532,600	125,405,600	143,491,300	159,756,600
Lignite . . . . .	126,756,600	137,223,400	147,162,100	161,426,900
Iron Ore . . . . .	1,075,200	1,805,400	2,508,300	2,601,100
Lead . . . . .	91,000	98,400	101,500	101,100
Zinc . . . . .	162,000	212,800	205,000	207,700
Rock salt . . . . .	1,841,300	2,024,200	2,077,200	2,383,800
Potash . . . . .	7,362,800	9,616,700	11,672,500	11,764,600
Pig Iron . . . . .	5,246,500	8,716,700	12,846,200	15,502,500
Steel . . . . .	7,393,200	11,601,700	16,013,500	18,590,900

**Banking and Finance.**—No exact statement can be made in regard to the German Government's revenues and expenditures, as the budget has not been published since 1934. The taxes by the Central Government have more than doubled since Hitler came to power, being about 6,000,000,000 marks for 1932-33, 11,500,000,000 for the fiscal year ending March 31, 1937, and estimated at more than 14,000,000,000 for the year ending March 31, 1938. This does not include taxes of about 4,000,000,000 marks levied by the Lands and local communities (*Gemeinde*). The exact debt is also unknown, because the large amounts of treasury bills issued to build armaments, auto highways, and other public works, and to provide for the unemployed, are not counted in the debt until they fall due. Between 1935 and Jan. 1938, the Government publicly increased the Reich debt by issuing eight long-term loans totalling over 7,000,000,000 marks, in order to take care of the treasury bills as they fell due and to consolidate the short-term indebtedness. These loans all bore 4½% interest, were issued at 98½, and were quoted in Jan. 1938 at a fraction above the issue price. They do not include a 500,000,000-mark loan issued by the State Railway (*Reichsbahn*) in 1936, nor loans by other Government enterprises. The total debt of the Reich in Jan. 1938 was conservatively estimated at more than 50,000,000,000 marks or \$20,000,000,000—approximately the same per capita debt as in the U.S. on the same date.

The Reichsbank's gold and foreign exchange reserves, which were about 4,000,000,000 marks in 1932, had shrunk to 75,000,000 at the end of 1937, and afforded only a 1.6% coverage for paper money, as compared with 24.7% in 1932 and with the 40% which before the World War was considered the lowest coverage compatible with safety. The standard of currency is the German mark, equivalent in U.S. money to 40.3325 cents. Owing to the Government's rigid control, its official exchange value is kept very close to its American and foreign equivalent.

**Education and Religion.**—Education has gone through a drastic reorganization under Nazi rule. The period of school attendance was shortened by one year in 1937. Many new schools have been established for giving a year or two of professional or technical training; for many students this will replace the last years at the regular schools or at universities and the older technical institutes (*Hochschule*). Many schools have also been established for training "leaders" for the Nazi Party and for government positions; emphasis in them is placed on comradeship, sports, Nazi ideology, and leadership.

Attendance at Germany's 24 universities has been considerably cut down since the Nazi Revolution, partly owing to Govern-

## GERSHWIN, GEORGE—GIBRALTAR

ment restrictions upon attendance, partly owing to the decline in the quality of teaching as a result of the dismissal or resignation of Jewish and liberal professors, and partly owing to other causes. The Government tends to shift students from the large city universities to the smaller town universities, especially those in Eastern Germany, where Nazi influence is stronger. Thus, the figures for attendance in the winter semester of 1929-30, and the limiting quotas fixed by Bernhard Rust, the Reich minister of Education, for the winter semester of 1937-38, were for the larger universities respectively: Berlin, 16,149, 6,000; Cologne, 11,162, 2,400; Frankfurt, 5,242, 1,700; Hamburg, 3,995, 1,700; Munich, 9,028, 4,800.

The Evangelical Protestants and the Roman Catholics, whose numbers and distribution are given in the table on p. 290, have suffered what they regard as severe persecution under the Nazi régime. The Protestant regional churches took steps in 1933 to form a single Reich Church in accord with Hitler's general policy of centralization. But aggressive Nazis, who ordinarily seldom attended church and who indulged in semi-pagan views, mobilized their efforts to secure the election of Ludwig Müller as Reich bishop of the new church. This caused a split, which has grown deeper and deeper, between the official Evangelical Church and the really devout Christian Opposition pastors and their followers led by Dr. Martin Niemöller (*q.v.*). After futile attempts at compromise, Protestant Church affairs were placed in charge of Hanns Kerrl, who in 1937 forbade Opposition pastors to take collections of money and allowed scores of them to be arrested by the secret police.

Pope Pius XI signed with Hitler in 1933 a Concordat guaranteeing to the Roman Catholics the free exercise of their religion, their religious schools, and their various religious youth, professional and charitable organizations. The guarantees have not been observed. The pope and the German bishops have denounced the Nazi persecution, and a considerable part of the Catholic priests are anti-Nazi. In Nov. and Dec. 1937, Minister Kerrl made speeches intimating that the Government was likely to withdraw its financial support from the Protestant Opposition group and from the Catholics.

**Army and Navy.**—By the Treaty of Versailles Germany was deprived of the greater part of her armaments, forbidden to have heavy aggressive weapons in the future, and limited in her army to a defensive force (*Reichswehr*) of 100,000 men enlisted for 12 years. On March 16, 1935, Hitler suddenly brushed aside all these limitations and announced that Germany would have an army based on the pre-War principle of universal military service. The term of service was at first fixed at one year, but in Aug. 1936, was extended to two years, giving Germany an army of something over 700,000 men. It is equipped with all types of the most modern weapons. The military air-force, built up by Göring, was estimated at the end of 1937 to include 2,500 military planes and 10,000 trained pilots.

The limitation of the German navy to six 10,000-ton battleships and certain smaller craft, was also scrapped by Hitler in June 1935, and replaced by an Anglo-German Naval Agreement severely limiting the German fleet to 35% (45% for submarines) of the British. Germany's naval tonnage at the end of 1937 was stated by *Weyer's Naval Handbook* to be 134,339 tons, and her building program to provide for bringing this tonnage up to 438,000 tons, by the construction of two 35,000-ton and two 26,000-ton battleships, two 19,250-ton aeroplane carriers, five 10,000-ton cruisers, and a considerable number of smaller vessels, including twenty-five submarines. Roberts, *The House that Hitler Built* (Methuen, 1937); Fritz Ermarth, *The New Germany* (Digest Press, 1936); E. Y. Hartshorne, *German Universities and National Socialism* (Harvard Univ. Press, 1937). (S. B. F.)

## Gershwin, George

(1898-1937), American composer, who was best known for his musical satire,

*Of Thee I Sing* (1931), and his concert piece, *Rhapsody in Blue* (1923). He was born in Brooklyn, Sept. 26, 1898, and, after studying with Charles Hambitzer, Ernest Hutchinson, Edward Kilenyi, and Rubin Goldmark, served his apprenticeship in Tin Pan Alley. In 1920 began his long series of successful musical comedies—*George White's Scandals*, *Lady Be Good*, *Tip Toes*, *Song of the Flame*, *Girl Crazy*, *Of Thee I Sing*, *Let 'Em Eat Cake*, and others. Among his more recent works were *An American in Paris*, a piece for symphony orchestras, and *Porgy and Bess*, a collaboration with his brother and DuBose Heyward. He died in Hollywood, July 11, 1937, just as he was preparing to enter the field of composing for the motion pictures.

## Gibraltar

a rocky headland connected by an isthmus with the Spanish mainland almost at its southern extremity, commanding the inlet to the Mediterranean, and less than 15 mi. from Africa; since 1704 a British possession and Crown Colony; area, 1,200 ac.; pop. (census 1931) 21,372, including 17,613 civilians; est. 1936 (civil only) 15,900, mostly, so far as concerns the civilians, of Spanish descent.

**History.**—The governor and commander-in-chief, His Excellency General Sir Charles Harington, G.C.B., G.B.E., D.S.O., is assisted by a small Executive Council, including three unofficial members.

The civil war in Spain having caused a number of refugees and others to settle in Gibraltar, the Government in May 1937 called attention to the consequent overcrowding and the danger of an epidemic, and offered to arrange for the transport to a Spanish port of such Spaniards as feared that their lives would be in peril if they re-crossed the frontier. It was announced that, if advantage were not taken of this offer, permits of residence would be reviewed and reduced in number. Later in the year questions were asked in the British Parliament relative to an allegation that Gen. Franco had, with the help of German experts, placed guns on the part of Spanish territory occupied by him which commanded the fortifications of Gibraltar; but the Government denied the allegation, and the matter dropped.

**Finance.**—The revenue of the Colony in 1936 was £211,500 and its expenditure £180,000; the revenue is mainly from customs,

Crown rents, fees, and port dues. The trade is mainly transit trade, and industries are all but non-existent. Banking is carried on by five private establishments. About 11 million tons of shipping enter the port yearly, and tourist traffic is rapidly increasing. British currency is in use; the local government issues its own currency notes. Spanish money, however, is also in circulation.

**Education and Religion.**—The non-military population are mostly Roman Catholic, and both the Catholic and the Anglican churches received a small Government subsidy. Elementary education, which is compulsory, is carried on in 13 schools, 11 of them Catholic; the average attendance in 1935-36 was 2,347. There are also four secondary schools.

**Defence.**—There is a large Admiralty harbour, and it is as a naval and military station that Gibraltar is of fundamental importance to the British Empire. About 2,700 British troops are stationed on the rock.

**Gifted Children.** Men are not created equal in intelligence. The gamut comprises: Idiot, imbecile, moron, backward, normal or average, superior (I.Q. 110-120), very superior (120-140) and near genius or genius (140 and above). The term Gifted Children is a bit confusing because formerly—and still to many people—it connoted children with some special gift, such as a gift in music, a gift for painting, or the like. As now used it is equivalent to "exceptionally intelligent." There is still uncertainty as to how many groups should be included in the "gifted" group. Genius and very superior, surely; but superior is very doubtful. The two include 6% of school children, and if we include superior it becomes 20%.

In the home, the exceptionally intelligent child is apt to be more or less of a problem. First, he is not understood and is apt to be treated as of an intelligence below his actual level. This annoys him and leads to maladjustment. Second, his emotional life does not, as a rule, keep pace with his intelligence. For example, a child of four might have the intelligence of the average child of six; but his emotional reactions would still be those of a child of four. This is confusing to parents and teachers. In school, these children do their work in half the usual time and then learn to be lazy or get into mischief. The best solution of this appears to be the special class with an "enriched" curriculum. Cleveland and Los Angeles have had such classes for 17 year olds with marked success. (H. H. Go.)

**Gift Tax.** The gift tax is a tax on the transfer of property during the life of an individual. It is not an entirely new tax, because such a tax was imposed in the United States in 1924 for the purpose of preventing a complete escape from payment of estate taxes through the simple expedient of giving away one's property while the owner was still alive. The tax raised comparatively little revenue and did not prevent escape from the estate tax. In 1926 it was abolished.

By 1932 the need for new revenues had become greater than in 1926; and a gift tax was enacted without debate in Congress. It seeks to impose a tax on gifts which are somewhat commensurate with the estate taxes on transfers by death. The basic law governing gifts today is this 1932 law; and the rates now in effect date from 1935. They are not as high as the estate tax rates. For example, the highest tax rate to which any part of an estate is subject is 70%. In the case of the gift tax the maximum rate is 52½%. While the gift tax rates are not high enough to destroy the incentive to divide one's estate during one's life, they are sufficiently high to raise substantial revenue. With the rapid increase in public expenditures which are still with us, it is more than probable that the gift tax will remain at least as high as it is

## GIFTED CHILDREN—GIRL SCOUTS

at present and in all likelihood will witness some increase in the future. There is every reason also to assume that it will remain a part of our fiscal system as long as the high rates levied on estates continue in effect. As a practical matter, these gift tax rates are enough lower than the estate tax rates where large sums are involved to make the transfer by gift an incentive. For this reason the yield of this tax may be expected to increase materially. (See also TAXATION.) (D. F.)

**Gilbert and Ellice Islands Colony:** see PACIFIC ISLANDS BRITISH.

**Gillette, William Hooker** (1855-1937), American actor and playwright who gained his chief fame in the title rôle of his play, *Sherlock Holmes*. He revived this play during 1929-30 and made his last Broadway appearance in a 1936 revival of *Three Wise Fools*. He died in Hartford, Conn., April 29, 1937. The *Encyclopædia Britannica*, vol. 10, p. 354, contains an account of his career.

**Ginger:** see SPICES.

**Girl Scouts,** a voluntary leisure-time organization in the United States for girls from seven to eighteen years old. Its program offers activities in the fields of homemaking, nature, out-of-doors, community life, international friendship, dramatics and literature, arts and crafts, music and dancing, health and safety, sports and games. It is adapted to girls of various ages: the Brownie program is for girls from seven to ten years old; the Girl Scout program for girls from ten to 14 years old; and the Senior Girl Scout program for girls from 14 to 18 years old. At the end of 1937 there were a total of 441,964 Girl Scouts in the United States. Girl Scouts, Inc. (the official title of the organization) is a member of the World Association of Girl Guides and Girl Scouts which has headquarters in London, England. Thirty-two countries are members of the World Association. At the end of 1935 the world membership numbered about a million and a half.

Lord Baden-Powell, founder of the Scout movement for boys and girls, founded the Girl Guides in England in 1909. The membership of the Girl Guides of Great Britain was 577,996 at the end of 1935. In 1912 Juliette Low (Mrs. William Low) brought

GIRL SCOUTS of the United States at encampment in celebration of the organization's twenty-fifth anniversary

the idea of the movement to the United States, where it was called Girl Scouting. In 1937 the Girl Scouts of the United States celebrated their Silver Jubilee at an international camp which was attended by representatives of 26 nations. Other international gatherings are held from time to time and a permanent international meeting place is maintained: "Our Chalet" at Adelboden, Switzerland.

**Gladioli:** see HORTICULTURE: *Gladioli*.

**Glands and Hormones:** see ENDOCRINOLOGY.

**Glasgow,** the largest city in Scotland and second largest in Great Britain, disputes with Sydney the title of second largest city of the British Commonwealth. Covering an area of 30,040 ac., it had at the 1931 census a population of 1,088,524, estimated to have increased to 1,124,300 in 1936. The city is situated on the river Clyde, one of the world's greatest commercial highways; in 1936-37 the port was entered by 7,582,000 tons of shipping, and 7,550,000 tons were cleared. At the end of December, a board of inquiry into the supply and regulation of casual labour about the Glasgow docks issued its report, recommending various measures to check abuses that had arisen regarding claims for unemployment pay.

The city is a great shipbuilding centre, and manufactures iron and steel goods, chemicals, textiles, and tobacco. Its university on Oct. 23 elected the first Pacifist Lord Rector of any British university, Canon H. R. L. Sheppard who defeated Scottish Nationalist, Unionist, and "United Front" candidates, including Mr. Winston Churchill, but died a few days after his election. On July 9, Glasgow received a visit from the King and Queen, the first since their accession. A strike of shipyard apprentices on Clydeside in March and April lasted five weeks, and on April 16 a sympathetic one-day strike took place which involved 100,000 workers. A strike of 1,500 men also occurred in an armament works at Parkhead, lasting seven weeks.

The main interest of Glasgow in 1937, however, concerned the Empire Exhibition which is to be held at Bellahouston park, opening in May 1938. Work began in February, about 10,000 men being employed in the preparation of the necessary buildings, which are to include an observation tower 300 ft. in height; the total cost of the Exhibition is expected to reach £10 millions. The site was inspected by King George at his visit in July. Considerable discussion took place on the question of the supply of alcoholic refreshments at the Exhibition, which is being held in a "dry" area; but the promoters succeeded in obtaining an order letting aside, for the period of the Exhibition and within its grounds, the prohibition of the sale of liquor.

**Glass.** Outstanding developments in glass manufacturing in 1937 have been: cooking utensils of toughened glass for use over flames; improved glass wool and fibre, and fabrication of glass ropes, yarns, and fabrics for many purposes; cellular glass (in Europe), formed by generating bubbles in masses of glass to produce light building material of high insulating value. The practice of lettering and labeling bottles with fired-on coloured enamels increased in popularity.

Production, in both America and Great Britain, showed a marked increase over 1935, the last year whose census figures are available. The British glass industry in 1935, used 530,000 tons of sand, employed 45,000 persons, and made ware valued at \$5,000,000. The American glass industry used 2,300,000 tons of sand, employed 67,000 persons, and the value of ware made was \$84,000,000. In both countries, bottles and jars make up about one-third the production value, with plate glass in second position. The comparatively lower number of employees and lower price

per unit weight in American production are explained by more mechanization.

Technologists were interested in the twenty-first anniversary of the Society of Glass Technology, whose journal, edited by Prof. W. E. S. Turner of Sheffield, is the most important record in English of glass research. Investigations in 1937 were largely directed at the elusive problem of constitution of glass. Co-ordinated efforts, arranged internationally through the Congress on Glass, were planned to determine values for the physical properties of glass as an engineering material. (See also ARCHITECTURE: *Materials*; FELDSPAR; FLUORSAPAR; GYPSUM.) (S. R. S.)

**Glass Brick:** see ARCHITECTURE: *Materials*; BUILDING AND BUILDING INDUSTRY: *Great Britain*.

**Gleaves, Albert** (1858-1937), American naval officer who as commander of the cruiser and transport force during the World War was responsible for taking about 1,000,000 United States troops safely to France. How this task was accomplished he described in *The History of the Cruiser and Transport Force* (1921). Following the war, he was awarded distinguished service medals by the army and navy. Born in Nashville, Tenn., Jan. 1, 1858, Admiral Gleaves attended the U.S. Naval Academy and after being commissioned an ensign in 1881 was promoted through all the grades until, on his appointment as Rear Admiral in 1915, he became commander of the destroyer squadron of the Atlantic Fleet. After the entry of the United States into the World War he was designated commander of convoy operations in the Atlantic. In 1918, he became vice admiral and in 1919 full admiral, in command of the Asiatic Fleet. After acting as commandant of the Boston navy yard he retired in 1922.

He died at Haverford, Pa., Jan. 6, 1937.

**Gleichen, Lord Edward** (1863-1937), British major-general; born in London, Jan. 15. For a biographical note, see *Encyclopædia Britannica*, vol. 10, p. 425. He retired from the army in Oct. 1919. His honours included the D.S.O. (1900), C.M.G. (1898), C.B. (1906) and K.C.V.O. (1909). He died in London, Dec. 14, 1937.

**Gliders.** The art of motorless flight made considerable progress during 1937. The greatest advance was made in Europe where the leading nations have subsidized the sport as a means of training pilots, but steady headway is also being made in the United States.

Largely because of this stimulation in Europe, performance records have risen steadily. The two-year distance record of 313 mi. was broken in Russia by Victor Rastorgoueff, whose remarkable flight of 405 mi. now stands as the world record. The women's record, a goal flight made in Germany, is now 218 miles. Through improvement in instrument-soaring technique in clouds, the Germans have raised the altitude record to 19,685 feet. They also hold the record for duration, 40 hours, 55 min. The American records have not been bettered, but progress has been made. During the Eighth Annual National Soaring Contest at Elmira, N.Y., a total of 2,224 mi. were flown cross country, twice the best figure of any previous year.

There are now more than 100 clubs affiliated with the Soaring Society of America. There is every indication that America is on the way to take its place in motorless aviation even without any Government subsidy. (L. D. B.)

**Glucose:** see CHEMISTRY, APPLIED.

**G-Men:** see FEDERAL BUREAU OF INVESTIGATION.

**Goebbels, Josef** (1897— ), German politician, born Oct. 29, 1897, at Rheydt in the Rhineland; studied at Bonn and several other German universities and took the degree of Ph.D. at Heidelberg in 1920. Active as a newspaper writer in the Rhineland, he became District Leader (*Gauleiter*) of the Nazi party in Berlin in 1926, and built up the party membership and organization in North Germany while Hitler was building it up in South Germany. He founded in 1927 and has edited ever since the party newspaper, *The Attack* (*Der Angriff*). In 1929 he was appointed Reich party propaganda leader, and in 1933, after Hitler assumed power, Reich Cabinet minister for propaganda and enlightenment and president of the Reich culture chamber with control over the press, radio and other cultural activities. He has been a member of the Reichstag since 1928. He is the author of many works of which the best known are: *Die zweite Revolution*, *Michael, Nazi Sozi*, *Kampf um Berlin*, *Rassenfrage und Weltpropaganda*, *Vom Kaiserhof zur Reichskanzlei*. (See GERMANY; NATIONAL SOCIALISM.) (S. B. F.)

**Goering, Hermann Wilhelm:** see GÖRING, HERMANN WILHELM.

**Gold.** Under the stimulus of the high currency price, the world production of gold continued to increase in 1937, though not so rapidly as in the previous year. The approximate output may be estimated at 35,500,000 fine ounces, compared with 32,960,000 in 1936 and 29,554,000 in 1935.

South Africa was still by far the largest producer, her output having been approximately 11,740,000 fine ounces, as against 11,336,000 in 1936 and 10,774,000 in 1935. Her production in 1937—obtained from crushing about 51,000,000 tons of ore, as against 48,600,000 tons in 1936—would have been still larger but for a reduction in the grade of ore milled, which averaged 4.46dwt. of fine gold, compared with 4.57dwt. in 1936 and 4.73dwt. in 1935. The policy of lowering the grade has been progressively pursued since the rise in the price of gold following abandonment of the gold standard by South Africa at the end of 1932, the object being to prolong the life of the mines and lessen the incidence of taxation.

It seemed at one time last year that this policy would have to be reversed because of the prospect of a sharp increase in working costs and a fall in the price of gold. Actually, however, working costs were only slightly higher and the average price slightly less than in 1936. The declared estimated working profit amounted to close on £31,700,000 (12s. 5d. per ton of ore milled), compared with £32,054,000 (13s. 2d. per ton of ore milled) for 1936. Dividends amounted to £17,071,000, against £17,296,000, all but a small proportion of the balance being payable to the Union Government in the form of taxation and royalties.

The proved payable ore reserves of the producing mines of the Rand are sufficient to ensure many more years of profitable production on last year's scale—provided of course that there is no very adverse movement in costs or in the value of gold. This satisfactory position is due partly to active development and exploration, and partly to the sharp rise in the price of gold since 1932, which has brought within the zone of payability vast quantities of ore previously classed as unpayable. The cost of developing ore on the producing mines has been financed almost entirely out of profits, as also has been a considerable proportion of the capital expenditure required for extensions to milling capacity, shaft sinking, etc.—which expenditure has been estimated to have exceeded £20,000,000 over the past five years.

Russia, whose output has expanded rapidly in recent years, ranks next to South Africa as a gold producer. Reliable estimates for that country are difficult to obtain—but competent authorities

UNITED STATES' new gold depository in a military reservation at Fort Knox, Kentucky, far from the seacoast and international boundaries

outside the Union place the Soviet's output for 1937 at not less than 6,000,000 fine ounces, compared with 5,400,000 in 1936. There is little reason to doubt that under more efficient management output could be still more rapidly increased, the more so as the bulk of the production in the Soviet Union is obtained by dredging and the rest by mining at shallow depths, which obviates heavy capital expenditure.

The United States held third place with an output of 4,089,000 fine ounces, against 3,714,000 in 1936, the Alaskan mines again providing a large proportion of the total. Canada followed close with an estimated output of 4,055,000 fine ounces, compared with 3,748,000 in 1936. The largest producing provinces were Ontario (approximately 64%), Quebec (17%), and British Columbia (12%).

Next in importance was Australia, whose production rose from 1,160,000 fine ounces in 1936 to 1,366,000 last year, though in certain directions there was evidence of serious impoverishment of ore bodies, suggesting that the rate of expansion may not be maintained in future years.

Most other gold-producing countries also increased their output, the progress made by the Gold Coast and the Philippines being particularly noteworthy. (See also FEDERAL RESERVE SYSTEM; GOLD RESERVES AND GOLD STANDARD; METALLURGY; PURCHASING POWER OF MONEY.) (P. F.)

**Golden Gate Bridge:** see BRIDGES; CALIFORNIA: *History*; SAN FRANCISCO.

**Gold Reserves and Gold Standard.** A nation's gold reserves are more accurately defined as its monetary gold reserves—that is, the gold coin in circulation and the gold bullion or specie held by the nation's central bank or other monetary authority. A more precise definition would exclude gold coin in circulation, though today the amount of such must be negligible. In normal times it would be fair to limit the definition to the gold held by the central bank as backing for the note circulation and for the deposits held with the central bank by the Government, the commercial banks, and others. This gold in effect forms the basis of the national supply of currency and credit, and as the central bank gains or loses gold, it must begin to consider measures for enlarging or contracting the supply of credit. Since 1931, however, the gold reserves of many coun-

tries, including England, France, and the United States, are held partly by the central bank and partly by the Exchange Equalization Account (*see* EXCHANGE EQUALIZATION FUNDS). The latter gold does not lie at the basis of the national supply of currency and credit, and variations in the amount of Exchange Account gold do not affect the internal supply of credit.

The importance of an adequate gold reserve is twofold. First, gold is the only medium in which foreign debts can be paid with certainty, because no foreign creditor can be forced to accept a country's paper currency, or bills or cheques drawn therein. Next, gold is the only basis of currency and credit in which people all the world over believe, and so it is the only guarantee of confidence. In England, it is true, people believe implicitly in the pound, although since 1931 it has been impossible to change it into gold except with the consent of the authorities. On the continent of Europe the belief in gold persists.

If a currency is ultimately changeable into gold at the public's behest and at a fixed rate of so many units of currency per ounce of gold, then a country is said to be on the gold standard. There are three forms of gold standard:

(a) The full gold standard: gold coins circulate, and the central bank is bound to redeem its notes on demand at a fixed rate. The central bank must also buy and sell gold in any quantities at fixed prices.

(b) The gold bullion standard: gold coins do not circulate. The central bank is only bound to buy and sell gold in bars of 400 ounces. This system was in force in England from 1925 to 1931, during which time a gold bar was worth about £1,700 sterling. The result was that the Bank of England only bought and sold gold in large quantities. This fulfilled the needs of bankers, who had foreign exchange differences to settle, but prevented gold from dribbling into internal circulation.

(c) The gold exchange standard: the central bank was not bound to buy and sell gold, but only to buy and sell bills, cheques, and other instruments drawn in currencies on the full gold or gold bullion standard. This system enjoyed a considerable vogue up to 1931, but the suspension of the gold standard in England gave it its death-blow, the reason being that sterling was a favourite currency for foreign central banks to buy and sell.

The essence of any form of gold standard is:

(1) The central bank must buy and sell gold at a fixed price.  
(2) The amount of notes in circulation and deposits held by the central bank must bear a defined relation to its gold reserves. In many countries the central bank must hold gold up to a given percentage of its notes and deposits; though of course it can and usually does hold gold in excess of that percentage. In England the fiduciary note issue is fixed by the Government, and all other notes must be backed pound for pound by gold.

(3) It follows that as gold enters or leaves the central bank, the supply of credit may have to be expanded or contracted. Thus internal credit conditions are linked up through gold with foreign exchange movements and the balance of trade.

(4) There must be no restrictions upon the importation or exportation of gold.

Since 1931, many countries, including England, have suspended the gold standard. They did so by abrogating the first of the above conditions. One result was a depreciation since 1931 of their currencies in terms of gold, that is, the price of gold rose. Some countries (not England) took the opportunity of writing-up their gold reserves, while the rise in the price of gold has made gold-mining more profitable and so increased the world supply of gold. Hence at a time when most countries are off gold, the world's gold reserves paradoxically enough are larger than ever.

To illustrate this, world gold production was 19.6 million ounces in 1929, 22.4 million ounces in 1932, and 35 million ounces in

1936. The Bank of England's gold reserves, which have not been written-up, have risen from £146 millions in 1929 to £326 millions in Nov. 1937. United States monetary gold stocks (written-up in the ratio of 59.06: 100 in 1934) have risen from \$2,857 millions in 1929 to \$12,804 millions in Nov. 1937. A wider comparison between 1929 and 1936 is shown in the following table:

Monetary Gold Stocks: End of Years

Central Banks of	National Currency	1929	1931	1936	1929	1931	1936
		(Millions of national currency)			(Millions of fine ounces)		
United States	\$	2,857	2,988	11,251*	138	145	322
England . . .	£	146	121	314	34	28	74
France . . .	frs.	41,668	68,481	60,359	79	129	77
Germany . . .	rm.	2,265	985	66	26	11	0.8
Holland . . .	fl.	447	887	720	9	17	14
Belgium . . .	bel.	1,175	2,553	3,736	8	17	21
Switzerland .	s.fr.	581	2,299	2,683	5	21	19
Total . . .		—	—	—	299	368	528

\*Total monetary gold stocks.

While most countries have suspended the gold standard, in practice international differences are still largely settled in gold. The gold so used, however, comes into or goes out of Exchange Accounts, leaving the central banks' gold reserves intact. Hence each country can run its own internal credit policy without having the supply of credit continually upset by changes in the size of its central bank's gold reserves. This was an advantage in 1933-37, when most of the exchange fluctuations and consequent gold movements were due to sudden transfers of capital about the world, and bore no relation to the internal commercial and financial position of a country. Whether it will always be an advantage for a country to divide its gold reserve between its central bank and an exchange account is open to argument, with weighty reasons on both sides. (*See also* AGRICULTURE: *Gold Standard*; EXCHANGE RATES; GOLD.) (N. E. C.)

**Gold Standard:** *see* GOLD RESERVES AND GOLD STANDARD.

**Golf.** The surge of golf interest in America, retarded appreciably during the economic depression, continued on the upbeat throughout 1937 and in many quarters reached a new high in financial structure and competitive brilliance. Club organizations, infused with newly recruited memberships, gave the game a firmer structure and golf exhibited signs of growing pains again, what with the renewed clamour for legislation to restrict the size, weight and number of clubs to be permitted a player, discussion in many circles of the advisability of reconstructing courses to halt the onslaught on par and the proposal to reduce the resilience of golf balls. As the year grew to a close, none save the limitation of clubs had found its way into the rules.

Where a player was permitted unbridled latitude in the number of implements, the United States Golf Association ruled that after Jan. 1, 1938 a competitor would be permitted to carry no more than 14 clubs, the result being no appreciable difference in phenomenal scoring. Ralph Guldahl, a giant Texan, won the United States open championship over the Oakland Hills Country Club course of Detroit, Mich., with a record 72-hole score of 281, eclipsing the 282 scored by defending champion, Tony Manero at Baltusrol, Springfield, N.J., in 1936. Guldahl's victory was accomplished in one of those Garrison finishes for which the open champion has become famous. Sam Snead, a powerful youth from West Virginia, playing for the first time, was

among the early finishers. His total was 283, a score which had been bettered only once in the history of the tournament. Guldahl's final round, enabled him to better Snead's score by a stroke. Snead, in a tour in which professional golfers participate travelling from one locality to another to compete in tournaments sponsored mainly by resorts and chambers of commerce in California, Florida, Texas, Georgia and the Carolinas, became the phenomenon of golf.

His exploits earned him a place on the United States team for the Ryder Cup matches, a biennial competition between picked teams of United States and British professional golfers. The United States team won the Ryder Cup matches on British soil for the first time since their inception. Heretofore the American and British teams always were victorious when playing on home soil.

There was an innovation in the contest for the United States amateur championship. For the first time in the 41 years since its inception, it was contested on a course in the Pacific North-west. Alderwood Country Club of Portland, Ore., was the scene and John Goodman of Omaha, Neb., won the title when he defeated Ray Billows, Poughkeepsie, N.Y., 2 up in a 36-hole final. Goodman became the fifth player in the history of American golf to win both the open and amateur championships. Goodman won the United States open title in 1933. Others to win both the open and amateur championships were Robert Tyre Jones, Jr., Charles Evans, Francis Ouimet and Jerome D. Travers.

The international flavour which spiced the 1936 United States women's championship was missing this year when illness prevented Miss Pamela Barton of Great Britain from defending the laurels she won at Canoe Brook, Summit, N.J., in 1936. The 1937 championship was contested at Memphis, Tenn., and the victor was Mrs. Estelle Lawson Page of Chapel Hill, N.C., who defeated Miss Patty Berg, Minneapolis, Minn., 7 and 6 in the 36-hole final. Mrs. Page, a Phi Beta Kappa graduate from the University of North Carolina, played remarkable golf. She was seven strokes over par for 129 holes. She won the medal with a 78 and was the only player in the field to score better than 80, duplicating her qualifying feat of 1936.

Although a victory in the Canadian open championship was his only national tournament victory in a decade of brilliant golf, Harry Cooper continued to lead professionals of the United States in average scoring. Cooper maintained an average of less than 72 strokes per round in 25 tournaments, winning the Harry Vardon Memorial trophy presented by the Professional Golfers Association of America. Last year Cooper lost this distinction by a fraction of a stroke to Guldahl. Cooper's prize winnings for the year reflected the return of golfing prosperity. He won over \$13,000 in cash, more than double the amount collected two years ago by Paul Runyan, the season's leading money winner. Byron Nelson, Reading, Pa., scored two important victories during the year, beating Guldahl by a whirlwind finish in the Masters' tournament at Augusta, Ga., an event sponsored by Robert T. Jones, and defeating Henry Picard in the finals of the \$12,000 Belmont, Mass., open, richest professional tournament in America. In late season links invasions of Central and South America, players from the United States won three titles. Picard won the open title of the Argentine; Goodman defended successfully the Mexican amateur title he won in 1936, and Mrs. Dan Chandler, Dallas, Texas, won the Women's Mexican championship. Youthful players from all sections of the country burst into prominence in sectional, State and national events, accentuating the difficulty of established satellites who had grown accustomed to dominating the field. (T. HU.)

**Great Britain and Europe.**—The Royal and Ancient Golf Club of St. Andrews, like most governing bodies in sport, moves slowly, and it was therefore a matter of some moment in the golf-

ing world when, during the past year, it decided to alter its constitution. The club now has one main committee of 16 members, a quarter of whom must retire in rotation each year. This committee is responsible for choosing all the sub-committees, who in their turn have the power to co-opt a limited number of outside members who are not actually members of the club.

This move had the appearance of making the government of the game more democratic, and gave general satisfaction.

Despite the usual rumours, no change was made in the specification of the golf-ball, though the new committee at once had the matter under their active consideration.

The open championship, played on the "marathon" course at Carnoustie, became virtually the championship of the world on account of the presence of the entire American Ryder Cup team. It was won in brilliant fashion by Henry Cotton (Ashridge, Herts), whose final round of 71 in blinding rain was reckoned one of the finest achievements in golf history.

Reginald Whitcombe, another Englishman, and Charles Lacey, brother of the English professional, but now resident in the United States, were second and third.

The United States won the Ryder Cup at Southport by three matches, but Cotton, following his Carnoustie triumph, beat Densmore Shute, American match-play champion, by five and four in a 72-hole £500 challenge match at Walton Heath. Over a course measuring more than 7,000 yds., Cotton's score was ten below an average of fours.

C. A. Whitcombe won the new Harry Vardon Memorial Trophy with a season's average of 71.64 per round.

In amateur golf, Robert Sweeny, a young American player who learned most of his golf in England, proved himself to be Britain's best player by winning the championship at Sandwich. He beat Lionel Munn by three and two in the final.

Miss Jessie Anderson, a youthful Scottish golfer of diminutive stature, won the ladies' championship at Turnberry in most convincing style, beating a fellow-countrywoman, Miss Doris Park, in the final. Both are daughters of professional players.

Coupled with Miss Anderson, Miss Wanda Morgan was the outstanding figure of the year. She won the English ladies' title for the second year in succession at St. Enodoc, Cornwall, and impressed every critic with the easy rhythm of her swing.

Ladies' golf, however, suffered an irreparable loss with the sudden death, at Turnberry, of Miss Bridget Newell. Runner-up to Miss Pamela Barton in the previous year, she also held the distinction of being a qualified barrister and Britain's youngest magistrate.

The results of the national championships were as follows:

**England.**—Amateur, J. J. F. Pennink (Royal Ashdown Forest). Ladies', Miss Wanda Morgan (Rochester and Cobham).

**Scotland.**—Amateur, H. McNally (Ardeer). Ladies', Mrs. A. M. Holm (Troon).

**Ireland.**—Open, Bert Gadd (West Cheshire). Open amateur, J. Fitzsimmons (Bushfoot). Native amateur, J. Bruen (Cork). Native professional, P. J. Mahon (Royal Dublin).

**Wales.**—Amateur, D. H. Lewis (Ashburnham). Ladies', Mrs. Graham Emery.

It is worthy of note that H. McNally, winner of the Scottish native championship, is a miner by trade, and had actually worked a full night shift immediately before winning his way through to the semi-final, a feat of exceptional physical endurance.

The continental championships became increasingly popular with British players, who achieved a fair degree of success. Henry Cotton, on a busman's holiday, won the German and Czechoslovak open championships, starting the tournament at Bad Ems with a 63, which he described as one of the finest rounds of his life.

Harry Bentley (Hesketh) won the German amateur title for the

second time, also at Bad Ems. No fewer than 46 British players went in quest of this title, of which the writer was at the time the holder.

Having beaten France in the international match at Chantilly, many of the English team took part in the French amateur championship at Morfontaine, Paris. It was, however, won by the French native champion, Jacques l'Eglise, who defeated Henry Longhurst by one hole in the 36-hole final.

Miss Kathleen Garnham (The Naze) won the French ladies' title, beating in the final Mrs. Rhodes, of Yorkshire, who in turn won the Belgian ladies' championship. (H. Lo.)

**Gonorrhoea:** see VENEREAL DISEASES.

**Gordon, Charles William** (1860–1937), leading Canadian author and churchman, was born at Indian Lands, Ont., Sept. 13, 1860. Trained for the ministry, his first posts were in Western camps where he gathered materials for books which were to make him famous. After touring Ireland and Scotland in the interest of Canadian missions, he began writing under the name of Ralph Connor. His first book, *Black Rock*, was a best seller. It was his second, *Sky Pilot*, however, which secured his reputation by selling over a million volumes. His church work was also significant; for in addition to serving as pastor of St. Stephen's Church in Winnipeg for thirty years, he played a leading part in social service work, gave outstanding service as a World War chaplain, and was prominent in the movement leading to establishment of the United Church of Canada in 1925. He died Oct. 31, 1937.

**Göring, Hermann Wilhelm** (1893– ), German statesman, born at Rosenheim in Bavaria on Jan. 12, 1893, achieved high distinction during the World War in the Air Force as an "ace" and as Commander of the Richthofen Squadron. After the War he served two years in civil aviation in Sweden where he married Karin von Fock of Stockholm; after her death in 1931 he married Emmy Sonnemann of Hamburg in April, 1935. As a result of participating with Hitler in the abortive Munich Beer Hall Putsch of Nov. 1923, he had to flee to Italy. Returning to Germany in 1927, he became active in the Nazi party and was elected member of the Reichstag (1928– ) and president of the Reichstag (1932– ). When Hitler was appointed Chancellor, Göring had heaped upon himself new tasks and honours in 1933 as Reich Cabinet Minister for Air Forces, Prussian Minister President, Minister of the Interior with charge over the Prussian police, theatres and opera, and General of Infantry. In 1934 his added titles included Master of the Reich Forests and Hunting, and Supreme Commander of the Air Forces. In 1936, as Commissar for the execution of the four-year plan, he gradually assumed supreme direction of the whole industrial life and foreign trade of Germany, and finally in Nov. 1937, superseded Dr. Schacht as economic dictator of Germany. He possesses great energy and driving force, and, unlike many Nazis, is not violently anti-Semitic. In power he stands next to Hitler and is generally regarded as Hitler's probable successor. He is the author of *Aufbruch einer Nation* (1934) and *Der Geist des neuen Staates* (1934). See GERMANY; NATIONAL SOCIALISM; and Erich Gritz-bach, *Hermann Göring, Werk und Mensch* (Munich 1937).

(S. B. F.)

## Government Departments and Bureaus.

The following are the leading officers of the more important Government departments and bureaus of the United States. The date for the information is Jan. 1, 1938.

Department or Bureau	Name	Post
Department of State	Hull, Cordell	Secretary
Department of State	Welles, Sumner	Under-Sec'y
Department of the Treasury	Morgenthau, Henry, Jr.	Secretary
Department of the Treasury	Magill, Roswell	Under-Sec'y
Comptroller of the Currency	O'Connor, J. F. T.	Comptroller
Treasurer of the U. S.	Julian, William A.	Treasurer
Bureau of Customs	Moyle, James H.	Commissioner
Bureau of Internal Revenue	Helvering, Guy T.	Commissioner
Bureau of Public Health	Parran, Thomas, Jr.	Surgeon Gen.
Federal Alcohol Administration	Alexander, W. S.	Administrator
The Coast Guard	Waesche, Russell R.	Commandant
Bureau of the Budget	Bell, Daniel W.	Director
Department of War	Woodring, Harry H.	Secretary
Department of War	Johnson, Louis A.	Asst. Sec.
Chief of Staff	Craig, Malin	Chief of Staff
Adjutant General	Conley, Edgar T.	Adj. General
Chief of Engineers	Schley, Julian L.	Chief
Chief of the Air Corps	Westover, Oscar	Chief
Department of Justice	Cummings, Homer S.	Att'y-Gen.
Solicitor General	Reed, Stanley F.	Solic. Gen.
Federal Bureau of Investigation	Hoover, J. Edgar	Director
Bureau of Prisons	Bennett, James V.	Director
Post Office Department	Farley, James A.	Post. Gen.
Department of the Navy	Swanson, Claude A.	Secretary
Department of the Navy	Edison, Charles	Asst. Sec.
Office of Naval Operations	Leahy, William D.	Chief
Bureau of Navigation	Andrews, Adolphus	Chief
General Board	Hart, Thomas C.	Chairman
Marine Corps	Holcomb, Thomas	Commandant
Department of the Interior	Ickes, Harold L.	Secretary
Department of the Interior	West, Harold	Under-Sec'y
General Land Office	Johnson, Fred W.	Commissioner
Office of Indian Affairs	Collier, John	Commissioner
Office of Education	Studebaker, John W.	Commissioner
Geological Survey	Mendenhall, W. C.	Director
Bureau of Reclamation	Page, John C.	Commissioner
National Park Service	Cammerer, Arno B.	Director
Bureau of Mines	Finch, John W.	Director
Department of Agriculture	Wallace, Henry A.	Secretary
Department of Agriculture	Wilson, M. L.	Under-Sec'y
Agricultural Adjustment Administration	Tolley, Howard R.	Administrator
Bureau of Agricultural Economics	Black, Albert G.	Chief
Bureau of Animal Industry	Mohler, John R.	Chief
Bureau of Biological Survey	Gabrielson, Ira N.	Chief
Bureau of Chemistry and Soils	Knight, Henry G.	Chief
Bureau of Entomology	Strong, Lee A.	Chief
Food and Drug Administration	Campbell, Walter G.	Chief
Forest Service	Silcox, Ferdinand A.	Chief
Bureau of Home Economics	Stanley, Louise	Chief
Bureau of Plant Industry	Richey, Frederick D.	Chief
Bureau of Public Roads	MacDonald, Thomas H.	Chief
Soil Conservation Service	Bennett, Hugh H.	Chief
Weather Bureau	Gregg, Willis R.	Chief
Department of Commerce	Roper, Daniel C.	Secretary
Bureau of Air Commerce	Fagg, Fred O., Jr.	Director
Bureau of the Census	Austin, William L.	Director
Bureau of Foreign and Domestic Commerce	Dye, Alexander V.	Director
National Bureau of Standards	Briggs, Lyman J.	Director
Bureau of Fisheries	Bell, Frank T.	Commissioner
Coast and Geodetic Survey	Vacancy	Director
Bureau of Marine Inspection and Navigation	Field, R. S.	Director
Patent Office	Coe, Conway P.	Commissioner
Department of Labor	Perkins, Frances	Secretary
Department of Labor	Vacancy	Asst. Sec'y
United States Conciliation Service	Kerwin, Hugh L.	Director
Bureau of Labor Statistics	Lubin, Isador	Commissioner
Immigration and Naturalization Service	Houghteling, James L.	Commissioner
Children's Bureau	Lenroot, Katharine F.	Chief
Women's Bureau	Anderson, Mary	Director
Independent Offices		
Civil Service Commission	Mitchell, Harry B.	President
Inter-State Commerce Commission	Splawn, Walter M. W.	Chairman
Federal Reserve Board	Eccles, Marriner S.	Chairman
Federal Trade Commission	Ayres, William A.	Chairman
United States Tariff Commission	Stevens, Raymond B.	Chairman
United States Board of Tax Appeals	Black, Eugene	Chairman
Federal Power Commission	Manly, Basil	Chairman
Federal Housing Administration	McDonald, Stewart	Administrator
Veterans' Administration	Hines, Gen. Frank T.	Administrator
Smithsonian Institution	Abbott, C. G.	Secretary
Pan American Union	Rowe, L. S.	Director
American National Red Cross	Grayson, Cary T.	Chairman
Reconstruction Finance Corporation	Jones, Jesse H.	Chairman

Department or Bureau	Name	Post
Federal Home Loan Bank Board	Fahey, John H.	Chairman
Tennessee Valley Authority	Morgan, Arthur E.	Chairman
Rural Electrification Administration	Carmody, John M.	Administrator
National Youth Administration	Williams, Aubrey	Director
Farm Credit Administration	Myers, William I.	Governor
Public Works Administration	Ickes, Harold L.	Administrator
Central Statistical Board	Rice, Stuart A.	Chairman
Federal Emergency Relief Administration	Hopkins, Harry L.	Administrator
Works Progress Administration	Hopkins, Harry L.	Administrator
Emergency Conservation Work	Fechner, Robert	Director
Federal Deposit Insurance Corporation	Crowley, Leo T.	Chairman
Securities and Exchange Commission	Douglas, William O.	Chairman
The National Archives	Connor, R. D. W.	Archivist
National Labor Relations Board	Madden, J. Warren	Chairman
Federal Communications Commission	McNinch, Frank R.	Chairman
Social Security Board	Altmeyer, Arthur J.	Chairman
United States Maritime Commission	Vacancy	Chairman
United States Housing Authority	Straus, Nathan	Administrator

**Great Britain.**—The following are the ministers, permanent under-secretaries, etc., of the more important of the Government departments of Great Britain:

Department or Bureau	Name	Post
Admiralty, The Board of	A. Duff Cooper	First Lord
	Sir R. H. Archibald Carter	Permanent Secretary
Agriculture and Fisheries	W. S. Morrison	Minister
	Sir Donald Fergusson	Permanent Secretary
Air Ministry	Viscount Swinton	Secretary of State
	Col. Sir Donald Banks	Secretary
Burma Office: see India Office		
Cabinet Office	Col. Sir Maurice Hankey	Secretary
Civil Service Commission	Sir Roderick Meiklejohn	1st Commissioner
Colonial Office	W. Ormsby Gore	Secretary of State
	Sir Cosmo Parkinson	Perm't Under-sec'y
Crown Agents for the Colonies	Sir W. F. Gowers	
	H. C. Thornton	
	J. E. W. Flood	
Commissioners of Crown Lands	The Minister of Agriculture and Fisheries ( <i>ex-officio</i> )	Commissioner
	C. L. Stocks	Perm't Commissioner.
Customs and Excise, Board of	Sir G. Evelyn P. Murray	Chairman
Committee of Imperial Defence	The Prime Minister	Chairman
	Sir Thomas Inskip	Deputy Chairman and Minister for Co-ordination of Defence
Dominions Office	Col. Sir Maurice Hankey	Secretary
	Malcolm MacDonald	Secretary of State
	Sir Edward Harding	Perm't Under-sec'y
Duchy of Lancaster	Earl Winterton	Chancellor
	Sir John Bennett	Vice-chancellor
Education, Board of	Earl Stanhope	President
	M. G. Holmes	Permanent Secretary
Foreign Office	Anthony Eden	Secretary of State
	Sir Robert Vansittart	Perm't Under-sec'y
(Appointed, Jan. 1, 1938, Chief Diplomatic Adviser to the Foreign Secretary; succeeded as Permanent Under-secretary by Sir Alexander Cadogan.)		
Health, Ministry of	Sir Kingsley Wood	Minister
	Sir George Chrystal	Secretary
Home Office	Sir Samuel Hoare, Bt.	Secretary of State
	Sir R. R. Scott	Perm't Under-sec'y
India Office	Marquess of Zetland	Secretary of State
	Sir Findlater Stewart	Perm't Under-sec'y
Inland Revenue, Board of	Sir Edward R. Forber	Chairman
Labour, Ministry of	Ernest Brown	Minister
	Sir T. W. Phillips	Secretary
Patent Office	M. F. Lindley	Comptroller-general
Paymaster General's Office	Lord Hutchison of Montrose	Paymaster-general
Pensions, Ministry of	Herwald Ramsbotham	Minister
	Sir Adair Hore	Permanent Secretary
Post Office	Maj. G. C. Tryon	Postmaster-general
	Sir Thomas Gardiner	Director-general
Privy Council Office	Viscount Halifax	Lord President
	Col. Sir Maurice Hankey	Clerk of the Council
Public Record Office	The Master of the Rolls	Keeper of the Records
	C. T. Flower	Secretary
Public Trustee Office	Sir Ernest Fass	Public Trustee
Scottish Office	Walter Elliot	Secretary of State
	Sir Horace P. Hamilton	Under-sec'y of State
Stationery Office, H.M.	Sir William R. Codling	Controller
Trade, Board of	Oliver Stanley	President
	Sir William Brown	Permanent Secretary
Transport, Ministry of	Leslie Burgin	Minister
	L. Browett	Permanent Secretary

Department or Bureau	Name	Post
Treasury . . . . .	Neville Chamberlain	Prime Minister and First Lord

	Sir Patrick Duff	Secretary

**Government Expenditures.** National budgets, responding to the growing demand for armaments, to expanding government participation in business and agriculture and to further continuance of unemployment relief, were enlarged again in 1937 among most of the principal powers, with few and slight exceptions. Total government expenditures in England in 1937 were £936,000,000, compared to £830,000,000 in 1936. The U.S. Government's expenditures during the fiscal year ending June 30, 1937, were \$8,001,000,000, as against \$8,476,500,000 in 1936. Ordinary governmental expenditures in France were Fr. 52,691,000,000, to which Fr. 14,100,000,000 of extraordinary expenditures were added. Germany has issued no returns of expenditures since March 31, 1935. Gross Reich revenue of Rm. 11,492,000,000 in 1936-37 was insufficient and the government borrowed, but only a part of these loans, Rm. 1,903,000,000, was disclosed.

Disguised or concealed charges, and undisclosed facts make it practically impossible to determine exact government expenditures among many countries, especially the totalitarian states. A further complication is the participation of these countries in business, in which activities considerable sums collected and spent by the government fall outside the budget. Also there is a practice of splitting budgets into "ordinary" and "extraordinary" expenditures, only the "ordinary" being covered by revenues.

Great Britain and the United States, however, disclose government finances in extended detail, which is presented in the following. For the United States the figures represent only the Federal government and do not include expenditures by any of the forty-eight States.

**United States.**—Federal expenditures of \$8,001,200,000 in the fiscal year ending June 30, 1937, were \$2,707,400,000 in excess of revenue receipts for the year, compared to deficits of \$4,360,600,000 in 1936 and \$3,001,800,000 in 1935. Official budgets for the year ending June 30, 1938, estimate expenditures at \$7,408,600,000, with a deficit of \$1,088,100,000, and for the year ending June 30, 1939, expenditures of \$6,869,000,000 and a deficit under a billion (\$949,000,000) for the first time since 1931.

Details of U.S. Government expenditures are shown in the table at the bottom of this page. These include actual expenditures for each fiscal year since and including 1931 and estimates for 1938 and 1939. Expenditures for unemployment relief in 1937 totalled \$2,466,800,000, compared to \$2,342,400,000 in 1936, to \$2,360,900,000 in 1935 and to an estimated \$1,759,000,000 in 1938. Relief expenditures are divided into three divisions, which include those for direct relief, \$184,300,000 for 1937, the smallest amount in this category for any year, as will be seen in the accompanying table. Work relief, however, which is shown in the table as expenditures by the WPA and CWA, reached \$1,896,700,000 in 1937. This the U.S. Treasury Department apparently considers as the peak for work relief expenditures, as the estimate for 1938 is more than a half billion dollars less and for 1939 still lower. Work relief in 1936 cost \$1,264,400,000 and in 1935 it cost only \$11,300,000 as that year the peak of direct relief, \$1,914,100,000 was reached. The Civilian Conservation Corps (CCC) is the third of the three items that make up the unemployment relief account. A comparison of the accompanying table shows the various trends in actual and estimated expenditures such as an increase in future expenditures for flood control, \$71,200,000 to be spent in 1938 as against \$54,600,000 in 1937, while river and harbour improvements have been decreased in favour of the more urgent flood protection.

**Great Britain.**—One of the most striking contrasts between pre-War days and the present time is the enormous growth all over the world in Government expenditure. In England, where the budget is subject to fewer qualifications than is the case in many other countries, this growth of expenditure can be illustrated very simply. See Table II.

Since 1911-13, total expenditure has increased in the ratio of 100 to 570. It has risen from 7.1 to 18.1% of the national income. Even since 1924, it has risen absolutely, though not relatively to the national income.

What are the principal causes of this enormous increase since pre-War days? The first and obvious answer is the World War, which raised the British national debt in five years from £650 to £8,000 millions, which latter figure also represents the size of the national debt today. In consequence, the interest and other annual charges of the national debt have risen from a mere £24 millions in 1911-13 to a peak cost of £357 millions in the middle '20s. Since then cheap money and conversion have reduced them to £224 millions, but they are still larger than the whole of the pre-War budget.

Table I—U. S. Government actual expenditures for each fiscal year ending June 30 from 1931 to 1937, inclusive, and estimates of expenditures in 1938 and 1939  
(In millions of dollars)

\*Figures of National Income refer to calendar years, figures of expenditure to financial years ended March 31 of following calendar year.

†Including Road Fund expenditure, but not Post Office.

‡Estimate. §Annual average.

¶Figures are taken from *National Income and Outlay*, by Colin Clark (Macmillan, 1937), pages 88, 90, and 232; they represent net National Income, as defined by Mr. Clark. The figures for 1936 and 1937 are very tentative guesses for which Mr. Clark is not responsible; the 1937 figure in particular is necessarily very approximate.

¶Inc. Sinking Fund.

Next is the rise in prices, wages, and the general cost of government. While this adds to the absolute size of the budget, it does not necessarily add to the burden on the nation, for the national income has also expanded for the same reason. In 1911-13, expenditure of £165 millions equalled 7.4% of the then national income.

Today expenditure in the same proportion would be as much as £380 millions.

It is now possible to make a few simple calculations. The 1911-13 expenditure, less the cost of the national debt, would come to £141 millions, or 6.3% of the national income: 6.3% today is £326 millions. Add on £224 millions, representing the present cost of the national debt, and we get a total of £550 millions.

This represents very roughly the portion of today's expenditure of £936 millions due to the above two causes alone. The balance of £386 millions must arise from other causes.

These are three in number. First, there is the growing cost of rearmament. Munitions of war are far more complicated and costly than they were 30 years ago. To mention the most obvious example, the Royal Air Force, which did not exist in 1913-14, has an estimated cost of £82.5 millions in 1937-38. Similarly, the cost of the navy has risen from £48.8 millions in 1913-14 to £105 millions in 1937-38, and that of the army from £28 to £91 millions. Part of these last two increases is due to the intervening rise in prices, and so is included under the calculations in the previous paragraph; but there is no doubt that, especially since the beginning of rearmament just over two years ago, defence expenditure explains part of the increase in the burden of expenditure.

Next, the Government plays a far more active part in the general business of the country than it did before the War. Subsidies are now granted to various kinds of farm produce and also to shipping. The functions of the Board of Trade, the Ministry of Agriculture, and the Department of Overseas Trade have been greatly extended.

Without expressing any opinion upon whether the benefits of these new activities are in proportion to their cost, there is no doubt that in the aggregate they represent a substantial addition to national expenditure.

Finally, there is the rapid growth of social reform expenditure. In 1911-13 this was in its infancy. Old age pensions had only been inaugurated a few years before. The first Insurance Act, establishing health and unemployment insurance, only dates from these years, and the scope of unemployment insurance was then limited to certain trades. The cost of education to the Government (as distinguished from the local authorities) was only £15 millions. There were no war pensions, no widows' and orphans' pensions, no expenditure upon housing, slum clearance, or the abolition of overcrowding. The derating of industry and the substitution of new grants-in-aid to local authorities only dates from 1929.

The current cost to the Government and local authorities is illustrated by the following table, relating to 1934-35:

	Million £'s					Number of persons (a) benefiting directly (Mns.)
	Expenditure	Receipts from			Total Receipts	
		Local Rates	Parliamentary Votes or Grants	Other Sources (Fees, etc.)		
Unemployment:						
Insurance benefit. . .	52.9	—	21.1	42.1	63.3	12.5
Transitional benefit. . .	46.2	—	46.2	—	46.2	
Health Insur. . .	36.7	—	6.7	33.8	40.5	18.5
Pensions:						
Widows, etc. . .	43.2	—	—	23.6*	23.6*	2.1
Old Age . . .	42.4	—	42.4	—	42.4	1.8
War . . . . .	41.2	—	41.2	—	41.2	0.9
Education . . .	106.3	48.5	49.1	8.7	106.3	8.0
Housing . . .	46.1	2.9	15.7	27.5	46.1	—
Poor relief . . .	49.2	45.4	0.4	3.4	49.2	1.9
Other . . . . .	23.8	20.8	0.4	2.8	23.8	—

\*Exchequer contribution of additional £13,000,000 to Treasury Pensions Account.

(a) Unemployment and Health insurance: insured persons.

The Government's share is £223 millions, compared with a smaller amount in 1911-13.

In fact, today's cost is considerably more than the whole of the 1911-13 budget, and is comparable with the present cost of the national debt.

These roughly are the main causes of the size of present-day budgets. Expenditure is high today, both absolutely and relatively to the national income. Nor, with the rearmament program ahead, can the European tax-payer, for one, look for any relief in the near future.

Budgets all over the world have increased to an enormous extent. In France, the latest (1937) budget placed ordinary expenditure at frs. 52,691 millions, and to this should be added extraordinary expenditure of frs. 14,100 millions. Germany has issued no returns of expenditure since March 31, 1935. Gross Reich revenue in the year 1936-37 was rm. 11,492 millions, and disclosed borrowing was rm. 1,903 millions. Even these two together did not provide enough funds to meet current expenditure, for there was also a substantial amount of undisclosed short-term borrowing.

It is, in fact, extremely difficult to determine the current expenditure of many foreign Governments, or to make a valid comparison with pre-War days. Such comparison has become almost impracticable. The most that can be said is that current government expenditure is very heavy, indeed.

(N. E. C.)

Governors and Premiers: see BRITISH EMPIRE.

**owrie, Alexander Gore Arkwright Hore-Ruthven,**

**T BARON** (1872— ), V.C., G. C. M. G., British imperial administrator, second son of the 8th Lord Ruthven, born at Windermere on July 6, 1872, was educated at Eton. Joining the Highland Light Infantry in 1891, he took part in the Sudanese campaign in 1898, and won the Victoria Cross at the age of 27. Lord Gowrie served also as a special service officer in the Somali campaign of 1903-04. From 1905 to 1906 he was military secretary to the Governor of Ireland, and in 1908 to the governor-general of Australia. During the World War he fought with the Welsh Guards in France and Gallipoli, being severely wounded, receiving the D.S.O. in 1916, and several mentions in despatches; in 1917 he was promoted brigadier-general. From 1920 to 1924 he was in command of the Welsh Guards, and from 1924 to 1928 of the First Infantry Brigade at Aldershot. In the latter year he was appointed Governor-general of South Australia, and was created K.C.M.G., and in 1935 was transferred to the governor-generalship of New South Wales. On Aug. 18, 1935, his appointment as governor-general of the Australian Commonwealth was announced, and he assumed office on Jan. 22 of the following year. In Dec. 1935 he was created a baron, and on May 11, 1937, became a privy councillor.

**ozo:** see MALTA.

**rain:** see BARLEY; CEREALS; CORN; OATS; RICE; RYE; WHEAT.

**Grand Army of the Republic,** organization of Northern veterans of the U.S. Civil War, held its seventy-first national encampment at Madison, Wis., from Sept. 5-9, 1937. Of the 3,325 living members (1,072 having died since the 1936 meeting), less than 200 were able to attend but 122 could join in the mile parade. Those attending the convention, many of whom had been among the 107,098 who enrolled at fifteen or under, travelled in special railroad coaches attended by nurses. The convention heard U.S. Veteran Administrator Hines urge support of world peace movements and selected E. Overton H. Mennet, of Los Angeles, a retired Indiana physician, to succeed C. H. William Ruhe, of Pittsburgh, as commander. Des Moines, Iowa, was chosen as the city for the 1938 encampment. The most important action of the meeting, however, was the decision by secret ballot to participate with ex-Confederates in the seventy-fifth anniversary ceremonies of the battle of Gettysburg, July 1-3, 1938, as long as Confederate flags were not displayed. This condition proved no more acceptable to Confederate veterans than the use of the term "war between the States" and the invitation had proved to the assembled veterans of the North.

**Grand Coulee Dam:** see AQUEDUCTS; DAMS.

**granite:** see MARBLE AND GRANITE.

**grapefruit.** Production of grapefruit in 1937 centred in four States of the U.S., in South Africa, Cuba and Palestine. In the U.S. the crop in four States, Florida, Texas, Arizona and California, was 26,090,000 boxes, compared to 30,281,000 in 1936. The average annual crop in the U.S. in the five years 1928-32 was 14,730,000 boxes, as reported by the U.S. Department of Agriculture. Production in these four States in 1937 was as follows, with figures in parentheses being for the 1936 crop: Florida, 13,000,000 boxes (18,100,000). Of this crop 5,000,000 boxes were seedless grapefruit and 8,000,000 boxes, other varieties. The five-year annual average production, 1928-32, in Florida was 16,577,000 boxes. Texas, 8,900,000 boxes (9,231,000) and a five-year annual average of 1,457,000 boxes, which indicates how the

industry has grown in that area. Arizona, 2,300,000 boxes (1,400,000) and a five-year average of 408,000 boxes. California, 1,890,000 boxes (1,550,000) and a five-year average of 1,209,000 boxes.

South Africa exported to the United Kingdom 375,000 boxes of grapefruit in 1937 and British Honduras exported 35,000 boxes of grapefruit, 5,000 cases of canned grapefruit, and 4,000 gal. of juice. The United Kingdom took more than 1,000,000 of the 1,130,000 cases of canned grapefruit exported by the U.S. in the season of 1936-37, which produced an unusually large crop. Cuba's exports of grapefruit to the U.S. in 1937 were 11,388,000 lbs., compared to 11,563,000 lbs. in 1936. Exports of grapefruit from Palestine in 1937 were about 1,500,000 boxes, and 1,540,000 boxes in 1936.

(S. O. R.)

**Grapes.** With the exception of the United States, where the crop made a new record of 2,731,980 tons, the grape crop throughout the world in 1937 was generally disappointing and below the average. In France, wine production for 1937 is estimated at 1,300,000,000 gal., about 20% below the annual, five-year average.

Grape production, as measured in wine, American gallons, is given by the International Institute of Agriculture for the principal grape-growing countries, as follows, figures in parentheses being for the preceding year, 1936:

France, 1,300,000,000 gal. (1,154,033,000) and a five-year average of 1,663,622,000 gallons. Italy, 888,935,000 gal. (888,944,000) and a five-year average, annual production of 1,016,049,000 gallons. Algeria, 408,240,000 gal. (304,509,000). Spain, 273,400,000 gal. (no reliable data for 1936). The five-year annual average is 297,023,000 gallons. Greece, 84,927,000 gal. (50,694,000). Germany, 66,627,000 (87,583,000). Tunisia, 38,508,000 gal. (37,301,000). Danubian countries about half the production of 1936, which was 177,171,000 gal. in Rumania, 119,905,000 gal. in Hungary and 102,111,000 gal. in Yugoslavia. Austria, 22,534,000 gal. (30,012,000). Switzerland, below the 1936 vintage of 13,367,000 gal. and Czechoslovakia also under the 1936 crop of 13,862,000 gallons. Portugal had a larger crop than the 1936 crop of 97,978,000 gal., but below the five-year average of 208,482,000. Total world production of wine in 1937 is placed at between 4,200,000,000 and 4,500,000,000 gal. by the Institute, compared to 4,020,000,000 gal. in 1936 and a five-year average of 5,048,000,000 gallons. Southern hemisphere production in 1937 was 395,000,000 gal., chiefly from Argentina. In the United States, the 1937 grape crop was 43% larger than the 1,916,460-ton 1936 crop and 23% larger than the five-year average of 2,214,482 tons. California production in 1937 was 2,409,000 tons, of which 572,000 tons were wine grapes. Production of raisin grapes was estimated at 1,483,000 tons.

## Great Britain & Northern Ireland,

**United Kingdom of.** This comprises the main island of Great Britain, with numerous smaller islands off the English and Scottish coasts, and the six north-eastern counties of Ireland. It is a constitutional monarchy, with a King and a Parliament of two houses, the House of Lords consisting of about 670 hereditary peers, 24 spiritual peers, 16 Scottish representative peers, a number of Irish representative peers, (at present 14; vacancies are no longer filled), and a few life peers who have held high judicial office; and House of Commons,

numbering 615 members, elected by a practically universal suffrage. Ruler, King George VI; acceded Dec. 11, 1936, on the abdication of his elder brother, Edward VIII. Capital, London. Flag, the Union Jack, consisting of a red cross on a white field (for England), surcharged on a diagonal red cross on a white field (for Ireland), surcharged in turn on a diagonal white cross on a blue field (for Scotland).

**Area and Population.**—94,278 sq.mi., of which England (without Monmouthshire) covers 50,328 square miles. Population (census 1931), 44,937,444; of which England (without Monmouthshire) has 37,219,842; density 477 per sq.mi. Eighty per cent of the population in England and Wales are resident in urban areas. Death-rate (1936), 12.1 per thousand living; birth-rate, 14.8 per thousand living; infantile death-rate (under one year), 59 per thousand born alive. London, the capital, had a population at the 1931 census of 4,396,821 ("Greater London," or the Metropolitan Police area, having 8,202,818); in 1936 the estimated populations were 4,141,100 and 8,575,700 respectively. The next largest cities in England, with populations as estimated in 1937, are: Birmingham (1,018,800); Liverpool (846,400); Manchester (744,000); Sheffield (518,200); Leeds (489,862). In 1931 there were in England 113 towns with a population exceeding 50,000. (See also IRELAND, NORTHERN; SCOTLAND; WALES.) (X.)

**History.**—The year 1937 was marked by two events which, by reason of the deep personal emotions they aroused, made a lasting and unforgettable impression on the national mind: the coronation, and the retirement of Mr. Baldwin. The solemn and religious dedication of the young King and Queen—the word "young" was used by Mr. Baldwin in his coronation message, and we tend to think of them perhaps as younger and less experienced than they are—to the duties of their high office, was followed in all its details, not only by the thousands who lined the streets to witness the procession, but also by the millions all over the country at their own firesides, and indeed by countless millions more all the world over. The use of the microphone made the coronation of King George VI and Queen Elizabeth unique in the long line of British coronations, and far more nationally significant than any of its predecessors. Not only the favoured few, but all the world was with them in the Abbey throughout the noontide hours of May 12.

And if the coronation opened a new epoch to which His Majesty's subjects at home and abroad look forward with fundamental confidence, but also with far more anxieties than one could wish for, so did the retirement of Mr. Baldwin, 16 days later, bring to a close a career of public service which, in a peculiar degree, won admiration and gratitude extending far beyond the wide circle of his political supporters. Almost unknown to the public until four years after the end of the War, Mr. Baldwin had, between 1923 and 1937, been three times prime minister, and one of the two principal architects of the National Government which was formed to meet the financial crisis of 1931. Moreover, for 12 of these 14 years he had been the leader of the largest party in the House of Commons. Nineteen thirty-seven also saw deaths of Mr. Ramsay MacDonald, whose premierships had alternated with those of Mr. Baldwin during this period, and of Sir Austen Chamberlain and Mr. Snowden, two others of the ten statesmen who formed the Cabinet of the first National Government.

The accession to the premiership of Mr. Neville Chamberlain had for some time been a foregone conclusion, and was generally welcomed, in spite of the effort of some opposition journals to suggest that he would prove less friendly to social reform than his predecessor. The prize that has fallen to his lot had been missed by both his father and his elder brother before him.

In the sphere of domestic affairs, the year was marked by businesslike legislative activities, and by a fairly steady though not unbroken rise in industrial and commercial prosperity, for which the enormous rearmament program of the Government was partly, though only partly, responsible.

Of foreign relations and the prospects of peace, it is impossible to write with the same confidence and conclusiveness. The major problems waiting for solution at the beginning of the year were still unsolved at the end of it. The year's events in this department are such as cannot yet be seen in their true perspective. A further interval of time must elapse before the historian will be in a position to decide whether the average gradient of 1937 was upwards towards a peace worthy of the name or downwards towards disaster.

The course of events abroad, and the part the British Government has sought to play in connection with them, was watched with strained attention, of which evidence is to be found in the numerous debates on foreign affairs in the House of Commons. Perhaps these debates were too numerous. They compelled the foreign secretary and the prime minister to make guarded statements of policy at times when their work might have been eased had they been free to make no statement at all, and, owing to the supposed requirements of party politics, such debates suggest to foreign observers a degree of national disunity of opinion which did not in fact exist. None the less, they must be accepted as a manifestation of democracy, which, as Mr. Baldwin has said, is the most difficult as well as the best form of Government.

**Foreign Relations.**—The Spanish Civil War, which began in the summer of 1936, continued with unabated fury, and though the Nationalists under Franco, with their Italian and German auxiliaries, made extensive gains, the end was not in sight at the conclusion of 1937. On the southern coast the Nationalists advanced to Malaga and Motril in February, and in April they launched their big offensive on the Basque provinces of the north, which formed a detached group acknowledging the authority of the Valencia Government. Bilbao fell in June, Santander in August, and Gijon in September, and all these northern provinces became part of General Franco's domain. Around Madrid the fighting was destructive but inconclusive. In the last weeks of the year the Government forces made a successful assault upon the salient of Teruel, the nearest point to Valencia held by the Nationalists, but at the end of the year it was not clear whether they would be able to hold what they had gained.

The consistent aim of the British Government, summarized as "non-intervention," was achieved in so far as the Spanish conflict did not degenerate into a general European war, and seemed less likely to do so at the end of the year than on some earlier occasions. It was not achieved in so far as its aim was to secure the withdrawal of the non-Spanish volunteers fighting with the thinly veiled encouragement of their respective Governments on

UNITED KINGDOM: Index of business activity (*The Annalist*)

"BUT WHO WILL TAKE THE HEAD?" A British comment on the unity movement in Ireland, by Grimes in *The London Star*

other side. The British Government was the only Government of the Great European Powers which could claim a genuine neutrality of attitude towards the conflicting Spanish parties, but its carefully balanced program of withdrawal, laid before the Governments concerned at a conference in July, failed to give satisfaction. In March, the London Non-intervention Committee succeeded in establishing a scheme of supervision by land and sea which for a time prevented the arrival of further volunteers; but in June the bombing of a German battleship by Government aircraft, followed by the alleged firing of torpedoes at a German cruiser, led to the breakdown of this scheme by the withdrawal of Germany and Italy. In August there was an outbreak of attacks on the shipping of various nationalities by unidentified submarines in all parts of the Mediterranean. This was fairly promptly suppressed by the Nyon Agreement of Great Britain and France, subsequently joined by Italy, allotting zones of control to the several Mediterranean fleets. (See also MEDITERRANEAN, THE; SPAIN, CIVIL WAR IN.)

In the latter half of the year the Spanish Civil War was thrown to the background by the formidable attack launched by Japan on China. The pretexts for this war in the Far East were two comparatively trivial affrays, in which a few Japanese soldiers lost their lives, and there can be no doubt that the military coterie which rules Japan welcomed the opportunity of increasing their hold on the mainland of Asia. The Japanese launched their attack on Shanghai in August with forces which at first proved inadequate in view of the stubborn and skilful Chinese resistance, but by the end of October the country round Shanghai was in Japanese hands, and before the end of the year their forces had moved to the river Yangtze Kiang and occupied Nanking, the Chinese Government having shifted their capital to Chungking, several hundred miles up the river. In the north, the Japanese invasion spread over a territory three times as large as the United Kingdom, and including the old capital, Peking.

There can be no question that the Japanese, while supported

wholeheartedly by Italy and with reservations by Germany, have had a "bad press" in Great Britain. They have shown a singular inability to make plain to the Anglo-Saxon world the genuine difficulties of their position and their real grievances against China. Moreover, the wholesale destruction of life by the Japanese bombing of Chinese towns outside the area of hostilities provoked a vigorous condemnation of Japanese methods, even among those who realized that such incidents are bound to form an integral part of large-scale warfare under modern conditions. Neutrals have suffered from the military activities of both belligerents. In August, Japanese aeroplanes bombed a car containing the British ambassador to China, and in December they attacked with bombs and machine-gun fire a gunboat belonging to the United States. Protests were made after both these and other like incidents, with no result beyond formal apologies. British, and indeed world-wide, diplomacy has proved powerless to deal with the situation. A conference at Brussels of the signatories (including America) of the Nine-Power Pact, which regulated the Far-Eastern position in 1921, broke up without achieving any valuable result (see CHINESE-JAPANESE WAR; NINE-POWER CONFERENCE).

No appreciable advance or retrogression has been made in connection with the problems of Germany's relations with Great Britain and France. Italy and Germany have made carefully staged and spectacular advances towards amity on an "ideological front" in opposition to Communist Russia and her French ally. Germany continues to profess willingness to make a bilateral agreement with France, whereas France is unwilling to enter upon discussions unless they include the safeguarding of her allies in central Europe. With Soviet Russia, Germany will have no terms but those of frank hostility. The German demand for the restoration of her forfeited colonies has been widely and sympathetically discussed in the British press, but such discussions have served only to bring out the difficulties in the way of any plan of restoration, and the determination of most British schools of thought that, if there is to be a reassignment of territories which changed hands at or after the Treaty of Versailles, Great Britain must not be the only country called upon to make sacrifices in the interests of European appeasement. The visit of Lord Halifax, a distinguished member of the British Government, to Herr Hitler in November was a friendly gesture accepted in the spirit in which it was offered, but it is impossible to say whether it achieved any permanently valuable result.

*The Empire.*—The great event of the year in the history of the British Empire was the inauguration, in April, of Provincial Autonomy in the 11 provinces of British India under the terms of the Government of India Act of 1935. Of the 30,000,000 electors, though the majority of them are illiterate, 54% went to the polls, a result which compares favourably with any local Government election in England. The Congress party secured a majority in six provinces, and for some time it looked as though the extremist leaders of the party would persuade their provincial representatives to refuse to assume office in the Provincial Governments except on terms which the governors could not grant. Not for the first time, however, the immense prestige of Mr. Gandhi was thrown on to the side of moderation, and by July ministries representing the elected majorities had taken office in every province. The prospects of federation between British India and the Indian States have become more remote. However, the new Federal Court was established in the course of the autumn. (See also INDIA.)

Palestine, though not officially within the British Empire, is none the less a British responsibility. When the British Government undertook, after the War, the supervision of Palestine under a mandate with the purpose of establishing there a National

Home for the Jews, it was optimistically assumed that the incoming Jews and the native Arabs would amicably combine and form a single nationality, which could ultimately be entrusted with the Government of the country. It seems doubtful, in retrospect, whether this result could have been secured even under the most favourable circumstances. But conditions ever since the granting of the mandate had been consistently unfavourable, and Palestine had become the home of two rival nationalisms, neither of which was prepared to tolerate the other. The last and worst of several epochs of "unrest" led to the sending out of Lord Peel's Commission, which in June issued a report recommending the partitioning of the country. The Jews were to receive, ultimately in full sovereignty, a coastal strip, together with Galilee; the rest was to be joined with the existing Arab kingdom of Transjordan, with the exception of Jerusalem and a corridor to the coast, which was to remain permanently under a British mandate. The British Government accepted in general terms the proposals of the report, and secured the assent of the League of Nations to the further proceedings which the policy thus described involves. (See also PALESTINE.)

**Home Affairs.**—In domestic affairs the outstanding and characteristic activity of the year was the rearmament program, with its many and ramifying corollaries—increased taxation and diminished unemployment being the most obvious. During the year, £278,000,000 was spent on defence, of which £80,000,000 was to be met from the loan raised early in the year. In his last budget Mr. Chamberlain raised the income-tax by threepence to five shillings, and proposed a special and temporary tax on the growth of profits as a National defence contribution. The details of this scheme were condemned as unfair and unworkable by the leaders of the world of business, and after Mr. Chamberlain had become prime minister, his successor as chancellor, Sir John Simon, agreed to impose instead a general tax on all profits. An Air Raid Precautions bill became law, enacting measures for which responsibility is divided between the home office and the local authorities. In the course of the year many thousands of civilians of both sexes all over the country received their first lessons in the handling of gas masks. Mr. Hore-Belisha, promoted from the Ministry of Transport to the War Office, undertook a widely and judiciously advertised campaign for attracting recruits to the regular and territorial armies by improved conditions of service, and the recruiting for both branches reached higher figures than had been seen since the War.

The general legislation of the year, voluminous and useful but not spectacular, calls for little comment here. Most of it—the long-promised Factory Act, for example—embodied policies on which there was general agreement, and little scope was offered for "party politics" of the old-fashioned kind. Indeed, the various sections of the opposition appeared to disagree more heartily with one another than with the Government. A bill regularizing the anomalous salaries of members of the Government was followed by the adoption of proposals raising the salaries of all M.P.s from £400 to £600 a year. The enactment of the Matrimonial Causes bill, enlarging the grounds of divorce, was a personal triumph for Mr. Herbert, and an encouragement to private members in general to make the best use of the legislative facilities available for them. Indeed, more private members' bills reach the statute book year by year than the public in general realizes, though few of them deal with such thorny subjects as divorce.

Official recognition of the fact that the population is threatened with a reduction in numbers which may well become catastrophic in the course of a very few generations was afforded by the Population Statistics bill, enabling the registrars of births and deaths to obtain more detailed information than heretofore.

Scotland received a new and active-minded secretary of State

STEEL PRODUCED in Great Britain, 1916-1937

in Dr. Walter Elliot, who is devoting himself to problems of slum clearance, in which Scotland still lags far behind England. Northern Ireland observed with equanimity the new constitution promulgated by Mr. de Valera, which defined the territory of the Irish Free State as embracing the whole of "Eire" and its adjacent islands.

For wage-earners in general the year was one of solid progress. The total increase in wage rates amounted to £723,000 a week, a sum nearly equalling the combined increases of the three previous years since the turn of the tide after the great slump. Prices have also risen, but they have barely reached the price level of 1929, whereas wages are substantially in excess of the wages of that year. Rising prosperity is apt to be attended and impeded by widespread strikes, but 1937 has been remarkably free from such manifestations, which is evidence both of better feeling between employers and employed than prevailed in the years between the War and the general strike, and also of the existence of more efficient machinery for the adjustment of wages to changing conditions. An exception to the general amity of capital and labour was the ill-advised London bus strike, which covered the period of the coronation. The most notable industrial feature of the year was the rapid extension, without the need of legislative encouragement, of the system of holidays with full pay. It is estimated that nearly five million wage-earners, more than a third of the number of wage-earners insured against unemployment, now enjoy this privilege. An announcement, made in the first week of 1938, may perhaps be brought within this survey, since it may mark the beginnings of extensive experiments. A large Lancashire firm have undertaken to pay to their employees a weekly bonus of five shillings for each child in excess of three children in the family.

(D. C. So.)

**Transport and Communications.**—Railway developments in 1937 included the introduction of electric working on the line from London to Portsmouth (95 route miles) and the speeding-up of services between London and Northern England and Scotland, for which new rolling-stock and stream-lined locomotives were built. A 5% increase in railway rates came into force in October. Road development is proceeding in accordance with the "Five-Year Plan" announced in 1935, but no new spectacular schemes have come to the fore. Work was begun on a Dartford-Purfleet tunnel under the Thames east of London. In January a committee under Sir Henry Maybury recommended the co-ordination of inland mail and passenger air services, to be based on a central junction in the Manchester-Liverpool area. Imperial Airways Ltd., whose fleet consisted in November of 73 machines in commission or on order, inaugurated an air-mail service to East and South Africa in June, carrying letters at the rate of 1½d. per half-

nce. In November 8,424,000 wireless licences were current in Great Britain, and in October it was announced that for the first time broadcasts in foreign languages (Spanish, Portuguese and Arabic) were to be undertaken. Telephone developments included the laying of the first coaxial cable between London and Birmingham, in which two conductors can carry about 250 simultaneous conversations.

**Agriculture.**—Of the total land area of Great Britain, 21.5% lower proportion than in any other year since the World War) was arable in 1936; 31% permanent pasture, and 28% rough grazing land. Land is at present being continually transferred from crops to permanent grass. Some 1,798,000 ac. were under wheat, 2,249,000 under oats, 891,000 under barley, and 1,000,000 under potatoes, the total produce of these crops being respectively 6,759,000 quarters, 12,149,000 quarters, 3,809,000 quarters, and 3,804,000 tons. Fruit-growing occupied 327,718 ac. (excluding Northern Ireland). The estimated total value of agricultural output in England and Wales was £208,165,000, and the number of separate holdings (over one acre) 448,481, of which 434,229 were under 300 acres. Milk production was estimated at 1,414 million gallons. Livestock included 7,853,307 cattle, 24,205,423 sheep, 1,012,743 horses, and 4,040,176 pigs. It was announced during 1937 that the Government proposed to take measures to restore fertility, so that production might be increased in the event of war, and to raise by one-third the limit of wheat production allowed under the Wheat Act of 1932; and that a Livestock Commission would be set up, a subsidy of £5,000,000 being paid to producers of fat cattle.

**National Resources.**—One million forty-four thousand and thirty-three tons of sea fish (other than shellfish) were taken in British waters and landed in Britain during 1936, of an estimated value of £15,749,163. The latest statistics show that about 32,000 persons are employed in the fishing industry. The coal output in 1936 was about 228,000,000 tons, of which 50,330,000 tons were exported, 176,000,000 tons being available for home consumption. Attempts to find oil were continued during 1937 in Sussex and elsewhere, but without success. The output of electricity by authorized undertakers in 1936–37 was 20,868 million units, an increase of 13.3% over the previous year; 16,803,500,000 units were sold to 7,652,000 consumers.

**Commerce and Industry.**—The following table shows the value of Great Britain's exports and imports for the last complete year (1937). The figures represent thousands of pounds sterling:

	Imports	Exports	Re-exports
Food, Drink, and Tobacco	432,373	38,780	13,181
Raw Materials, etc.	315,345	64,652	36,914
Manufactured Articles	274,985	404,839	24,444
Animals not for Food	3,031	850	628
Parcel Post	3,331	12,473	—
Total	£1,029,065	£521,594	£75,167

Imports increased by £181,313, exports by £80,875, and re-exports by £14,751 over the preceding year. Of 1936 imports £32,380,000, or 39.2%, came from within the Empire, and 99.9% from the United States; of the exports of British produce £6,927,000, or 48.5%, went to countries within the Empire, and 7% to the United States.

The British mercantile fleet in 1937 amounted to 17,436,000 gross tons (26.7% of the world total). Five hundred and fifty new factories employing 25 or more persons were opened during 1936; and 14,381 new companies were registered, with a nominal capital of £164,422,038. The total number of public companies with share capital in England, Wales, and Scotland at the end of 1936 was 14,742, with paid-up capital of £3,993,-

310,303; of private companies, 130,820, with paid-up capital of £1,741,605,643.

**Banking and Finance.**—The unit of currency is the gold sovereign, weighing 123.274 grains eleven-twelfths fine, divided into 20 shillings (a silver coin .500 fine and weighing 87.27 grains) or 240 pennies; since the World War the ordinary currency, apart from silver and bronze coins, has been Bank of England notes of one pound and 10 shillings, which are legal tender (even by the bank itself) for any amount. On Oct. 13, 1937, the amount of bank notes issued was £526,406,625, of which £489,858,849 was in the hands of the public, and £36,547,976 in those of the bank. In November the fiduciary note issue was temporarily raised (for two months) from £200,000,000 to £220,000,000 to meet seasonal demands. The gold reserve of the United Kingdom in 1937 was estimated at 1,531 million pre-War gold dollars.

An exchange equalization fund of £350,000,000 operates when necessary by the issue of treasury bills to prevent undue disturbance in foreign exchange rates, but details of its operations are not made public.

The budget of April 1937, excluding self-balancing revenue and expenditure, showed an estimated revenue for 1937–38 of £863,100,000, and an expenditure of £862,848,000, as in the following table:

ESTIMATED REVENUE		
	£	£
Property and Income Tax	288,150,000	
Surtax	58,000,000	
Estate and Death Duties	89,000,000	
National Defence Contribution	2,000,000	
Stamps	29,000,000	
Other Inland Revenue Duties	1,500,000	
Total Inland Revenue		467,650,000
Customs	219,850,000	
Excise	113,150,000	
Total Customs and Excise		333,000,000
Motor Vehicle Duties		34,000,000
Crown Lands		1,350,000
Interest on Sundry Loans		4,300,000
Post Office (net receipts)		11,800,000
Miscellaneous		11,000,000
Total Ordinary Revenue		£863,100,000
ESTIMATED EXPENDITURE		
		£
Grants for Local and Other Services		181,274,000
Irish Services		15,162,000
National Debt, Interest and Management		224,000,000
National Pensions and Insurance and Unemployment Assistance		182,497,000
Defence		200,650,000
Tax Collection		14,274,000
All Other Services		34,991,000
Margin for Supplementary Estimates		10,000,000
Total Ordinary Expenditure		862,848,000

Not included in this table are the self-balancing items of £72,238,000 for the postoffice revenue required to meet its expenditure, and £2,870,000 for the broadcasting grant obtained from licence fees.

The main sources of the tax revenue of the United Kingdom are customs, excise duties (especially on alcoholic liquors and entertainments), income tax and surtax, estate and legacy duties, motor vehicle duties, and stamp fees. For the proceeds raised from these sources and for any changes in the incidence of taxation, etc., see BUDGET.

The National debt at the end of March 1937 totalled £7,916,526,894 (internal, £6,883,963,804; external, £1,032,563,090), including £897,534,246 due to the United States of which no repayment has been made since 1932. Against this was to be set £119,000,000 for Victory Bonds, etc., purchased by the National Debt

Commissioners but not yet cancelled.

Great Britain has no State bank. The Bank of England (in Scotland, the Royal Bank of Scotland) operates under Royal charter in close association with the treasury, and lends money to the State. Commercial and private banking is largely concentrated in the hands of five great joint-stock banks, though numerous smaller institutions also operate. The Bank of England return of Dec. 8, 1937, showed:

ISSUE DEPARTMENT		
Notes issued:		
In circulation . . .	£492,830,681	
In Banking Dept. . . . .	53,575,934	
		Govt. Debt . . . . . £11,015,100

	£172,586,847	£172,586,847

During the year the note circulation of the Bank of England for the first time in history passed the £500,000,000 mark. In 1936 the 11 London clearing banks' total clearings were £40,616,574,000, an increase of £3,056,823,000 or 8.1% over the previous year. On March 31, 1937, £1,378 millions were invested in Postoffice and Trustee Savings banks and in National Savings Certificates—the highest total ever known. The balance due to depositors in the Postoffice Savings Bank on Dec. 31, 1936, exceeded £432,000,000, in addition to £165,000,000 invested in Government stock; deposits made during the year exceeded £130,000,000.

**Education and Religion.**—Education, both elementary and secondary, is administered by the local authorities under the supervision of the Ministry of Education (or, in Scotland, the Scottish Education Department). In 1936 there were 20,880 elementary, special, and nursery schools in England and Wales, of which 10,180 were "public" (wholly maintained by local education authorities) and 10,700 "voluntary" (partly so maintained, but managed by religious or like organizations), with a total average

daily attendance of 4,748,453. In Scotland there were 2,900 primary schools, with an average daily attendance of 580,233. Elementary teachers in England and Wales numbered 169,591; in Scotland, 19,461.

"Efficient" secondary schools in England and Wales in 1935-36 numbered 2,116 (of which 1,389 were aided by Government grants), with 559,248 pupils and 24,003 teachers; in Scotland 251 post-primary schools had 159,591 scholars and 6,764 teachers. The total expenditure on education by local authorities in England and Wales (1935-36) was £21,153,338, for higher and (1936-37) £69,591,538 for elementary schools; in Scotland (higher and elementary, 1936-37) it is estimated at £13,403,097. In 1936 England and Wales had 263 technical and commercial colleges and other similar institutions, with 38,172 full and 1,044,958 part-time students. Scotland had 145,774 students attending 953 centres of various kinds for continuation classes. England has 11 universities (Oxford, Cambridge, London, Durham, Manchester, Birmingham, Liverpool, Leeds, Sheffield, Bristol, and Reading), with in all about 4,450 professors, lecturers, etc., and 39,650 students, and five University colleges at Exeter, Hull, Leicester, Nottingham, and Southampton. Nineteen thirty-seven was remarkable for a donation of £2,000,000 to Oxford university for medical research, and later £1,000,000 and a site for a new college for post-graduate social studies and for other purposes, both by Lord Nuffield; and plans were announced during the year for the reconstitution of Durham university.

The language spoken and taught in the schools of Great Britain is English; but in Wales and Scotland Welsh and Gaelic respectively are still the only languages of a small proportion of the population.

In England, the Protestant Episcopal Church is established by law, and is governed by two archbishops and 41 bishops, with (1936) 2,382,857 Easter communicants. The largest Nonconformist bodies are the Methodists, Congregationalists, and Baptists (*qq.v.*); there are some 2,350,000 Roman Catholics, and about 300,000 Jews. (*See also IRELAND, NORTHERN; SCOTLAND; WALES.*)

**Defence Forces.**—The navy, army, and air force of Great Britain are separately administered, but the Cabinet includes a minister for the co-ordination of defence, and a Committee of Imperial Defence, representing all three services, overlooks general policy. Parliament has authorized the raising by loan of £400,000,000 for defence purposes.

**Navy.**—The British navy is governed by the Board of Admiralty, headed by the First Lord of the Admiralty (a Cabinet Minister), and including also four Sea Lords, a deputy and an assistant chief of naval staff, a Civil Lord, a parliamentary secretary and a permanent secretary. The authorized personnel (officers and men) is 112,000. Vessels in service, building, or projected in 1937 included 20 battleships and battle cruisers (15 completed), 15 heavy cruisers, 62 other cruisers, 202 destroyers and 70 submarines; the shipbuilding program for 1937-38 includes 3 battleships, 2 aircraft carriers, 5 large and 2 small cruisers, 16 destroyers, 7 submarines, and 43 other craft. Of the five capital ships now under construction, two will be ready in 1939 and three in 1941.

During 1937 some 32 new ships (including six cruisers, nine destroyers, and three submarines) were completed. The budget estimate for the navy for 1937-38 totalled £78,065,000 with additional expenditure otherwise provided for of £27,000,000.

**Army.**—The British army is enlisted throughout on a voluntary basis. It is administered by the Army Council, presided over by the secretary of State for War (a member of the Cabinet) and including eight other members. The regular army establishment (excluding India) provided for in the 1937-38 estimates was 168,900 officers and men. The Territorial army, the main auxiliary

"A SWEETENER!" Trade-pact negotiations between Great Britain and the United States, as seen by *The News of the World*, London

THE PORTICO of the Bank of England in Threadneedle Street, showing the symbolic sculptures

military force, serving in time of peace at home only, had on Dec. 1 an establishment of 203,000, and an actual strength of 158,948. It is being rapidly reconstructed, largely with a view to anti-aircraft defence. The army reserve on Jan. 1, 1937, numbered 118,400 effectives. The estimated expenditure for army purposes in the 1937-38 budget was £63,120,000, an increase of £7,500,000 over the estimates of the previous year; funds to be derived from loans, etc., raised the net total to be spent to £82,174,000.

During the year important changes in army conditions were announced, designed to promote recruiting, including the modernization of barracks, abolition of irksome pay deductions, changes in the age limits and physical requirements of recruits, etc. Plans that are being carried forward include the expansion of the tank corps, and of anti-aircraft units, the formation of two new infantry battalions, and the almost complete mechanization of the cavalry. At the beginning of Dec. 1937 important changes in the high command and General Staff were announced, senior officers retiring to make way for their juniors; and it was stated by the Secretary of State for War, Mr. Hore-Belisha—who had replaced Mr. Duff Cooper in May—that in future, not seniority, but "merit, character, and ability shall be the main entitlement to promotion and reward."

**Air Force.**—The Royal Air Force, a voluntarily enlisted body, is governed by the Air Council, consisting of the secretary of state for air and six other members. In April 1937 it consisted of 100 squadrons stationed at home, 26 serving overseas, and 20 serving with the Fleet Air Arm (the control of which latter, it was announced in July, is being transferred to the Admiralty). The strength of the air force in April, including auxiliaries, was 55,850; the establishment at present provided for is 70,000. Training takes place at 13 civil and 11 service flying schools.

Existing plans provide for the organization of a Metropolitan air force with a first-line strength of 1,750 aircraft organized in 124 (including 20 auxiliary) squadrons. A new Royal Air Force volunteer reserve for the training of civilians was formed during the year.

The budget estimates for 1937-38 envisaged an air force expenditure of £56,500,000, to be increased by expenditure on loan account to £82,500,000. A number of new aerodromes are under construction, principally on the eastern side of Great Britain, and during the year the output of aeroplanes and of aeroplane construction machinery was greatly accelerated.

**Police.**—The police of Great Britain are under the control of the County or Borough Councils, except in the London area (outside the "City"), which is policed by a force (the Metropolitan police) under the direct control of the home office. The efficiency of the provincial forces is secured by a system of Government inspection and grants in aid. In 1936 the total authorized strength of the police forces in Great Britain was 65,845 (England and Wales 59,238; Scotland 6,607), including 207 women (175 and 32 respectively).

Net expenditure for police purposes in England and Wales was £21,480,745; in Scotland £2,397,246. During 1937 much progress was made with the provision throughout the country of "police boxes" at convenient points which may be used by the public to get into instant touch with the police by telephone and, in London, a method of telephoning direct to Scotland Yard in cases of emergency was introduced.

**Greece** (*Kingdom of Hellas*), a monarchy of S.E. Europe, bounded W. by the Adriatic, N. by Albania, Yugoslavia and Bulgaria, E. by Turkey and the Aegean. Ruler, King George II. Flag, narrow blue and white stripes.

**Area and Population.**—The area is about 50,270 sq.mi., of which 41,652 sq.mi. are mainland and 8,618 sq.mi. islands; population (Dec. 1935): 6,839,000. In 1928 the population was 6,204,684, of whom 5,759,523 were Greek-speaking, 191,254 speaking Turkish, 81,984 "Macedonian," 63,200 Spanish. 5,961,529 belonged to the Greek Orthodox Church, which is the religion of state; 126,017 were Moslems. Elementary education is compulsory. The higher educational system is well developed.

Chief towns: Athens, pop. (1928) 392,731; Salonica, 236,524; Patras, 61,278; Kavalla, 49,980.

**History.**—In 1935 King George had been restored to the throne. General elections held in Jan. 1936 brought about a deadlock. On March 15 M. Demerdjis formed a Government; but on April 13 he died suddenly, and General Metaxas, deputy prime minister and minister of war, took his place. Parliament was prorogued, but a political amnesty was voted. There was, however, much unrest, due largely to the Communists, who had held the balance after the elections.

A general strike was called for Aug. 5. General Metaxas proclaimed martial law, suspended articles of the constitution guaranteeing the liberty of the subject, and dissolved the chamber. Since that date the press has been so strictly controlled that little news from Greece has penetrated abroad. General Metaxas has embarked on a program said to consist of social reform, the development of industry, and reorganization of defence.

In foreign affairs the chief note during 1937 was one of warm friendship for Turkey. The two premiers exchanged visits and messages of the utmost cordiality.

**Finance, Trade, and Communications.**—The monetary unit is the drachma, nominally equal to 1.298 gold cents; this had sunk by March 1937 to 40.7% of its nominal value. Greece has a heavy public debt, contracted both before and after the War. In 1936 the internal debt amounted to 12,346.9 million dr. and

the foreign debt to 35,016.8 million dr. The combined services amounted to 3,004.6 million dr. interest and 68.5 million dr. amortization. For some years Greece has been in default on her foreign debt. In 1936 she agreed to pay 40% of the interest due, but the council of bondholders expressed dissatisfaction. The balance of trade was heavily passive (1935, 10,681 million dr. imports, 7,101 million dr. exports); but there are large invisible imports.

The chief trade, both for imports and exports is with Germany and Great Britain. Industry, has, however, developed rapidly. The index of industrial activity for 1936 was 151 (av. 1925-29, 100). The budget for 1936-37 showed estimated receipts of 12,725.4 million dr. and expenditure of 13,285.6 million dr.

**Defence.**—Military service is compulsory and universal. The budgetary effectives of the army in 1936 numbered 5,187 officers and warrant officers and 52,680 other ranks (average). The navy consists of 1 battleship, 2 cruisers, 21 destroyers and torpedo boats, and 6 submarines. The navy is at present being re-equipped, largely from British sources, while in Jan. 1937 a contract was signed with Germany for a loan of 2,500 million dr. for war material.

**BIBLIOGRAPHY.**—J. Miller, *Greece* (London, 1928); J. Mavrogadato, *Modern Greece* (London, 1931). (C. A. M.)

**Greenland**, the world's largest island (about 840,000 sq.mi., of which about 35,000 are ice-free), in the Arctic ocean, N.W. of Iceland, and a Danish possession; capital, Godthaab. Population (1930), 16,700, of whom 400 are Danes. The trade, which is a Government monopoly, is almost entirely with Denmark.

On April 8, 1937, Denmark took formal control of Thule, the most northerly inhabited place in the world, which since 1913 had been a kind of small independent commune. During the year it was announced that the pack-ice-free harbour of Faeringehaven, on the south-west coast, would be open for general navigation until Oct. 1941, and many fishing vessels have taken advantage of this new facility.

Exploration in the interior continues; new settlements are being made on the north-west coast; and the new openings for Greenland in the fields of trans-Atlantic aviation and the dissemination of meteorological information are making of importance a vast territory hitherto regarded as practically valueless.

**Greenough, Robert Battey** (1871-1937), American surgeon who established a national reputation for his work as a cancer specialist. Born in Cambridge, Mass., Nov. 9, 1871, he was graduated from the Harvard medical school in 1896. From 1909 to 1932 he served as assistant professor of surgery at that institution and from 1917 to 1929 was director of the Harvard Cancer Commission. He was also a consulting surgeon at the Massachusetts General Hospital and the Collis P. Huntington Memorial Hospital and chairman from 1929 to 1931 of the board of directors of the Society for the Control of Cancer. While serving as president of the American College of Surgeons during 1934-35 Dr. Greenough advocated the adoption of periodic pre-payment health insurance plans in various communities so as to provide adequate medical care for persons of average means. His death occurred in Boston, Mass., Feb. 16, 1937.

**Guadeloupe**, a French colony in the West Indies, including the island of Guadeloupe and several minor islands; language, French; capital, Basse-Terre. Governor, Félix Éboué. The area is 688sq.mi. The population was 302,659 (1936 census). The chief cities with populations in 1931 are: Basse-

Terre (9,268), Pointe-a-Pitre (30,465), and Le Moule (17,107). The colony is administered by a governor and an elected general council and is represented in the French parliament. In 1937, the French agricultural moratorium and labour arbitration laws of 1936 were extended by decree to Guadeloupe. Regular steamer service connects the colony with France and with the United States.

Imports in 1936 aggregated 125,459,000 francs in value, exports, 170,944,000 francs. The chief imports are foodstuffs, textiles, beverages, and lumber, with 65% supplied by France. Its chief exports, almost entirely to France, are bananas (49,672,400 francs value in 1935) and rum (33,603,300 francs value in 1935) and, of less importance, sugar and coffee. The island produces annually 35,000 metric tons of cane sugar, 10,000,000 litres of rum, and 26,000 tons of bananas.

There are 18 sugar mills and 94 rum distilleries. The French franc (value: 3.4¢ U.S.) is legal tender. There are over a hundred schools, including secondary and professional, with 10,000 pupils.

**Guam**, a possession of the United States of America and the largest and most populous island of the Marianas, lies at the southern end of that group, approximately 1,500 miles E. from Manila; area about 225 square miles; population on July 1, 1937, 22,132, including 20,662 natives of Guam who are called Chamorros; the remainder are foreign-born and personnel of the U.S. Naval Establishment. The capital and only city is Agana, having about one-half the total population of the island.

The island was discovered March 6, 1521, by Magellan and remained a Spanish possession until June 21, 1898, when it was captured by the United States, later being ceded to the United States by the Treaty of Paris. Since acquisition it has been under the jurisdiction of the Navy Department with a naval officer commissioned as governor by the president. The people are regarded as wards of the United States Government. Immigration, while not prohibited, is not encouraged and no alien may own land.

Public schools had an average enrolment of 4,527 during 1936-37. Emphasis is placed upon the English language, health and sanitation, and upon industrial and agricultural training. Health and sanitary conditions are very satisfactory. All medical attention is given by the naval medical officers who treat the people free of charge.

Hospitalization is also provided without cost. The only bank is the Bank of Guam, conducting a commercial banking business as a division of the Treasury of the Naval Government of Guam, which owns the capital stock. Copra is the only export of importance: 5,201,968 pounds were exported during the fiscal year 1937. The community is essentially an agricultural one. The land is fertile and native foodstuffs are plentiful. (O. M. H.)

**Guatemala**, a Central American republic; language, Spanish; capital, Guatemala City; President, Jorge Ubico. Guatemala (48,290 sq.mi.) had a population of 2,373,083 (1935 census). The leading cities are Guatemala city (116,000), Quezaltenango (35,000), Totonicapan (30,000), and Coban (27,000). On February 15, President Ubico began his second six-year term of office. In conformity with his famous "Law of Probity", which requires all office holders to file statements of personal assets upon entering and leaving office, he took the occasion to make public his own and his wife's personal accounts. Chaotic conditions in the world coffee market, accentuated by the Brazilian developments of Nov. 1937, caused considerable excitement in Guatemala late in 1937. In 1936 total imports were 11,511,947 quetzales, exports, 15,106,264 quetzales, with the United States

leading. Guatemala has 850 miles of railroads, 3,000 miles of highways. Steamship service and airways provide external communication. Coffee (annual production approximately 130,000,000 lbs.) is the chief product. Bananas, cabinet wood, and precious metals are also important, with some manufacturing for domestic consumption. The monetary unit is the quetzal (value: approx. 1.00 U.S.). Seven banks have total assets of 29,144,155.86 quetzales. The 1937 budget was balanced at 9,225,000. Marked advances in education have been made in recent years. The number of schools increased from 2,219 in 1935 to 2,476 in 1936, with an added enrolment of over 15,000. The 1937 budget allotted 1,230,000 to education, making the fifth successive year of continued increase. Guatemala has compulsory military service, and maintains a standing army of 7,000. (L. W. BE.)

**Guernica**, a small town in the province of Vizcaya, Spain, of about 7,000 inhabitants, at one time the capital and "holy city" of the Basque people. It became unhappily famous in April 1937 in consequence of its savage destruction on the 27th by aircraft attached to Gen. Franco's insurgent troops. The town was bombarded for 3½ hrs. by a fleet of aeroplanes of German type, and was almost completely destroyed by fire, save for the historic oak under which the Spanish kings formerly swore to uphold the democratic rights of the Basques, and the Casa de Juntas, where the Basque parliament once sat, and the archives of the race were preserved. The insurgent leaders denied that the destruction of the town was their work, or that they had any part in the raid, suggesting that Guernica had been bombed and fired by the Basques themselves in an endeavour to excite indignation against the insurgents. The town was occupied by insurgent forces on April 29.

On May 3, the insurgents admitted that a few of their bombs might have fallen on Guernica, but still maintained that the main work of destruction was not theirs; however world opinion remained unconvinced by these disclaimers. The Spanish Government in June gave the number of casualties in Guernica as 1,654 dead and 889 wounded.

**Guest, Frederick Edward** (1875-1937), P.C., C.B.E., D.S.O. British soldier and politician; born June 14, 1875, the third son of the first Baron Wimborne; died at Sunbury-on-Thames, April 28, 1937. He saw military service on the White Nile, 1900, in the South African War, and in the World War, being awarded the D.S.O. in 1917. Early in his political career he acted as private secretary to his cousin, Mr. Winston Churchill. After some unsuccessful attempts to enter Parliament, he sat as Liberal M.P. for East Dorset, 1911-12, Stroud, 1923-24, and North Bristol, 1924-29; and in 1931 he was elected as a Conservative for the Drake Division of Plymouth. He was Secretary of State for Air from 1921 to 1922.

**Guinea, Spanish:** see SPANISH WEST AFRICA.

**Gypsum.** The gypsum industry is so closely linked to the building industry, which uses most of the product, that the decline in building operations so prevalent during the depression years was seriously reflected by the gypsum industry throughout the world; but more so in the United States than elsewhere. The

peak of the United States output was 5,678,000 short tons in 1925, which had already declined to 5,016,000 tons in 1929; the decline continued to 1,536,000 tons in 1934, followed by a recovery to 2,713,000 tons in 1936, which is still less than half of the former high.

About one-quarter of the current output is used in cement manufacture in crude form, while 1% is used by agriculture as a soil addition and 3% goes to various minor uses; the remainder is calcined and, except for some 7% that is used in the glass and ceramic industries, is absorbed in the production of plasters, wall-board, and other building products. U.S. production is supplemented by imports, chiefly from Canada, to the extent of about 20% of the consumption. (G. A. Ro.)

**Gyroplanes:** see AVIATION, CIVIL: *Special Aircraft*.

**Hadley, Henry Kimball** (1871-1937), American composer and conductor, founder and honorary president of the National Association of American Composers and Conductors, was born in Somerville, Mass., Dec. 20, 1871. He composed four operas, three overtures, four symphonies, seven operettas and over 150 songs, piano pieces and cantatas during his lifetime. Among the orchestras which he conducted were the Seattle, San Francisco, Manhattan and Chicago Symphony Orchestras and he was an associate conductor of the New York Philharmonic Orchestra for seven years. While insisting upon the performance of American compositions as part of his programs, his own works were not typically American for he opposed all efforts to create a special school. He died in New York City, Sept. 6, 1937 after an extended illness. Additional information regarding his career is contained in the *Encyclopædia Britannica*, vol. 11, p. 65.

**Hadow, Sir (William) Henry** (1859-1937), C.B.E., British scholar and musician; born at Ebrington, Glos., Dec. 27, 1859; died in London, April 9, 1937. For a biographical notice, see *Encyclopædia Britannica*, vol. 11, p. 65. Sir Henry retired from the vice-chancellorship of Sheffield university in 1930. His later publications included: *Church Music* (1926); *Collected Essays* (1928); *English Music* (1931); and *Richard Wagner* in the Home University library.

**Hafid, Mulai** (—1937), ex-sultan of Morocco, died at Enghien-les-Bains, France, on April 4, 1937. For an account of his reign, see *Encyclopædia Britannica*, vol. 15, p. 818. After his abdication in favour of his brother, Mulai Yusef, Mulai Hafid lived in Spain and France.

**Haiti**, a West Indian republic occupying the western third of Hispaniola; language, French; capital, Port au Prince; president, Stenio Vincent. The area is 10,204 sq.mi. Population (estimate, 1936) 2,550,000. It is almost entirely negro. The chief cities are Port au Prince, 125,000, and Cap Haitien, 14,000. Haitian overpopulation and underdevelopment have in the past caused emigration for work in sugar plantations in Cuba and in the Dominican Republic. Early in 1937 the Cuban government transported a considerable number of them back to Port au Prince. In October a serious crisis with the Dominican Republic occurred, when Haitians living in that country were attacked by armed parties, instigated—so it was charged—by the Dominican president himself.

By an agreement of Oct. 15, the Dominican government, while minimizing the entire affair, undertook to conduct an investigation to fix responsibility. As continued incidents were reported, the Haitian government, on Nov. 12, appealed to Cuba, Mexico, and the United States to use their good offices and to mediate. The

Dominican government denied any such need, and, early in December, charged that counter-raids were being made. On Dec. 13, Haiti invoked the "Gondra treaty" of 1923 and subsequent Pan-American pacts which provided for permanent inter-American committees of investigation. According to official Haitian estimates, 8,000 Haitians had been killed and a greater number wounded. Unofficial, normally reliable estimates placed the total as "at least 10,000" killed. The year closed with considerable tension. Fifteen ports are open to commerce. There are 164mi. of railways and over 1,000mi. of motor highways. In 1936, imports totalled \$7,584,125 in value, chiefly from the United States (56.5%), with Great Britain (12.5%) second. Exports aggregated \$9,447,719 (coffee, 62%; cotton, 15.3%), chiefly to France (47.2%), Great Britain (15.1%), and the United States (14.24%). In 1937, exports declined, as a result of the instability of coffee. Haiti ranks fifth as a world producer of coffee. Cotton, sugar, and sugar products are also important.

The monetary unit is the gourde, fixed by law at 20¢ United States. The public debt on Nov. 30, 1937, was 43,418,702.07 gourdes, a reduction of over 4,000,000 in 12 months. Fiscal control is in the hands of a financial adviser nominated by the President of the United States. There are over 400 primary and secondary schools, with over 50,000 students. (L. W. BE.)

**Halévy, Elie** (1870-1937), French historian; born at Étretat, Sept. 6, 1870; died at Sucy-en-Brie, Seine-et-Oise, Aug. 21, 1937. A biographical note is to be found in the *Encyclopædia Britannica*, vol. 11, p. 90. The two volumes of his *Epilogue* to his famous *Histoire du peuple anglais au XIX<sup>e</sup> siècle* appeared in 1926 and 1932 respectively, and in an English translation, in 1929 and 1934 respectively. This work is held to be one of the best histories of the period 1815-1914, with the period 1841-95 left unfortunately uncovered at the time of Halévy's death. His other works include *The World Crisis, 1914-18*.

**Hammer Throw:** see TRACK AND FIELD SPORTS.

JOSEPH PLATAK, of Chicago, Ill., the world's greatest hand-ball player

**Hand-ball** continued its popularity during 1937 as one of the favourite pastimes among national sports in the United States. A large increase in the number of women players was noticeable. The classic event is the national four-wall championship, held every year. In 1937, the Lake Shore A.C. of Chicago was the host with entries representing all sections of the country. The winner in the singles, for the third consecutive year, was Joseph Platak of the home club. In the doubles Platak also scored teaming up with his club mate C. R. Weiller. National four-wall rankings for 1937 are as follows:

#### Singles

1. Joseph Platak, Chicago
2. Sam Atcheson, Memphis
3. Jack Schwartz, Baltimore

#### Doubles

1. Joseph Platak and C. R. Weiller, Chicago
2. Joseph Gordon and Andy Berry, Los Angeles
3. Frank Coyle and Edward Linz, New York A. C.

Many sectional championships are held during each year in the leading centres to provide the best competition in the four-wall sport, with organizations such as the New York Athletic Club, in the East, the Los Angeles A.C. and Olympic Club (San Francisco) in the West, and the Lake Shore A.C. in the Middle West setting the pace.

There is considerable interest manifested in the one-wall game, which is played almost exclusively in the East. New York city has been the scene of all the national tournaments in this branch of the game and is considered to have the best players in the country. National one-wall ratings follow:

#### Singles

1. Harry Goldstein, New York
2. David Margolis, New York
3. George Baskin, New York

#### Doubles

1. George Baskin and Harry Goldstein, New York
2. Morton and Seymour Alexander, New York
3. Samuel Feuer and Marvin Hecht, New York

#### Women's Rankings (one-wall only)

1. Lucy Caruso, New York
2. Helen Lohman, New York
3. Mrs. Hannah Kaufman, New York

(FR. RO.)

**Hapgood, Norman** (1868-1937), American editor, was best known for his crusading editorials during the early years of the 20th century. He was born in Chicago, March 28, 1868, and received his arts and legal degrees from Harvard in 1890 and 1893. After practising law for a year, he joined the staff of the *Chicago Evening Post*. He later served as reporter for *The New York Evening Post* and as dramatic critic for *The New York Commercial Advertiser*. As editor of *Collier's Weekly* from 1903-12, his editorials were influential in overturning the dictatorial control of Joseph G. Cannon, speaker of the House of Representatives. He also helped expose the land-grab scandals of the Taft Administration and led one of the first crusades for pure food and drugs. On becoming editor of *Harper's Weekly* in 1913, he actively supported the policies of Woodrow Wilson and was rewarded in 1919 with the post of U.S. Minister to Denmark. His editorship of *Hearst's International Magazine* during 1923-25 was marked by war on the Ku Klux Klan and he joined Henry Moskowitz in writing a biography of Alfred E. Smith entitled *Up from City Streets* (1927). His other publications included *Literary Statesmen* (1897), *Daniel Webster* (1899), *Abraham Lincoln* (1899), *The Stage in America* (1901), and *Industry and Progress* (1911). He died in New York city, April 29, 1937.

**Harlow, Jean** (Harlean Carpenter) (1911-1937), American motion picture actress, whose death at twenty-six years of age brought a sensational career to a sudden close. Born in Kansas City, Mo., March 3, 1911, she was educated at schools there, in Hollywood, and in Chicago. In *Hell's Angels*,

roduced in 1930, Miss Harlow's unusual blond hair started the "platinum blond" fad. At twenty-one she obtained her first starring vehicle, *Red Headed Woman*. By 1935 she was a leading box-office attraction, drawing \$3,500 a week for her work for Metro-Goldwyn-Mayer. Her most important pictures were *Public Enemy*, *Dinner at Eight*, and *Labeled Lady*. Her death occurred in Hollywood, June 7, 1937.

**Arper Prize Novel:** see LITERARY PRIZES: *United States*.

**Harvard University**, oldest institution for higher education in the United States, completed the first year of its fourth century during 1937. At the end of the fiscal year, June 30, 1937, investments exclusive of land, buildings and contents stood at \$144,865,521. Gifts during the year were \$5,193,462 for capital account and \$1,518,052 for immediate use. Scholarships and other student aids totalled \$619,640. The year, 1937-38, began with an enrolment of 8,138 full time and 1,773 part time students, and President Conant announced in his annual report that any substantial increase would be opposed in favour of a more careful selection of entrants. The staff of 1938 included three new deans, James M. Landis of the Law School, Harald M. Westergaard of the Graduate School of Engineering and John H. Williams of the Graduate School of Public Administration.

The organization of the Graduate School of Public Administration, made possible by gifts from Lucius N. Littauer, was the outstanding development of 1937. During the early months exploratory conferences were held and in September a trial session was initiated with plans for starting regular work in 1938. Construction was begun on a building to house the school on the site of the Hemenway gymnasium, a landmark whose name will be retained in a new but smaller athletic centre.

Other developments during 1937 were the raising of entrance requirements in the Law School, the liberalization of rules for the choice of studies to aid in the selection of fields for specialization and steps taken in the administration of gifts for botanical research and journalistic training. In his annual report President Conant urged that the number of unrestricted gifts be increased only 16% in five years being without restriction) and urged establishment of a centre for students in the graduate schools. The Harvard university library, largest university library in the world, had 3,863,050 volumes and pamphlets on June 30, 1937, an increase of 67,448 over the previous year.

**Hopkins, Charles Homer** (1870-1937), American mediaevalist, who served as dean of the Harvard graduate school from 1900-1931, was born at Meadville, Pa., Dec. 21, 1870. After graduating from Johns Hopkins in 1887, he taught at Johns Hopkins, Wisconsin, and Harvard. Among his publications were *The Renaissance of the Twelfth Century*, *Studies in Mediaeval Culture*, *Studies in the History of Modern Europe*, *Norman Institutions*, *The Normans in European History*, and *The Rise of the Universities*. In addition to this work, for which he received many awards in both the United States and Europe, he served as chief of the Division of Western Europe of the American Commission to Negotiate Peace in 1918 and as a member of the Committees on Danish and Belgian Affairs and on Alsace-Lorraine and the Saar at the Paris Peace Conference.

He refused the presidency of Johns Hopkins university in 1911, preferring to remain at Harvard. He died in Cambridge, Mass., May 14, 1937.

**Hats for Women:** see FASHION AND DRESS: *Hats*.

**Hawaii.** The Territory of Hawaii consists of a group of eight larger islands and numerous islets in the Pacific ocean between latitudes 18°55' and 22°15' north and between 154°50' and 160°30' west longitude. Their total area is 6,438 square miles. The islands are of volcanic origin. From south-east to north-west, they are Hawaii, Kahoolawe, Maui, Lanai, Molokai, Oahu, Kauai, Niihau. In addition, stretching north-westward beyond Niihau over 1,100 miles is an archipelago of rocks, reefs and shoals which includes Midway (longitude 177°22' west) recently notable as the first stop beyond Honolulu of the trans-Pacific clipper planes. Likewise, 960 miles south of Honolulu and a part of the city and county of Honolulu lies Palmyra, a coral atoll consisting of fifty-five islets, five miles long and two and a half miles wide. The youngest island, geologically, and the largest in the group is Hawaii, with an area of 4,030 square miles.

The capital of the Territory is Honolulu, situated on the island of Oahu. It is a completely modern city with a population (1930 census) of 137,582. Oahu is the scene of the United States' strongest fortifications in the Pacific. Hawaii's population of 368,336 in the 1930 census is estimated at approximately 400,000 in 1937. The racial origin of this population, in addition to the native Hawaiians and Caucasians from the mainland, is Japanese, Chinese, Korean, Filipino, Portuguese. 81% of the population, however, is native born; immigration into the Territory except for citizens from the American mainland, has ceased.

The governor and Territorial secretary are appointed by the President. Otherwise the Territory is wholly self-governing. It elects to Congress every two years a delegate who has a voice in the House of Representatives but no vote. The governor in 1937 was Joseph B. Poindexter; and the delegate, Samuel W. King. The Territory collected in taxes and fees \$13,242,666 in 1937 and expended \$12,021,679. In addition, Federal taxes were paid into the U.S. Treasury of \$11,633,487.56, exceeding the payment of seventeen States of the Union.

**Agriculture.**—Hawaii's chief crops are sugar and pineapples. Expert management, scientific methods and costly irrigation works have raised the sugar production to a maximum of 1,035,548 tons in 1933 with a value of \$66,482,181. This output was subsequently reduced as a result of quota limitations established under the Jones-Costigan Act. The pineapple industry, next in importance, reached in 1937 a maximum of 879,641,271 lbs. with a value of \$59,395,090. Other agricultural crops are coffee, macadamia nuts, papayas and taro, a root used by the natives in making the native "poi" and also now being processed into flour.

The tourist industry has developed rapidly in the last two decades, reaching a total of over 55,860 tourist visitors in 1937. One characteristic of Hawaii, unique among all regions under the American flag, is that there are no billboards. (E. GRU.)

**Hawthornden Prize:** see LITERARY PRIZES: *Great Britain*.

**Hay.** Production of both tame and wild hay in the United States was placed at 83,087,000 tons from 66,344,000 ac. by the Department of Agriculture. This shows a substantial increase over the previous year (1936) when 70,386,000 tons were harvested from 67,868,000 acres. For the country generally the supply of hay and roughage is ample. Areas in which there is a light supply include North-east and Central Montana, the Western third of the Dakotas, a large part of Kansas and Nebraska, the Eastern third of Colorado, the Western half of Oklahoma, parts of North and West Texas, South-west Iowa and North-west Missouri, and parts of New Mexico which lacked adequate rainfall again in 1937. The increased use of mechanical corn pickers and combines has reduced the supply of roughage ordinarily conserved in some areas. The average yield of both tame and wild hay in 1937 was 1.25

tons per acre as compared with 1.04 tons in 1936. All production of tame hay in 1937 totalled 73,785,000 tons, with an average yield of 1.37 tons per acre. In 1936 the tame hay crop was 63,536,000 with an average of 1.11 tons per acre. The tame hay acreage harvested in 1937 was 54,792,000 ac., as against 57,289,000 ac. in 1936. The 1937 crop of wild hay was 9,302,000 tons at an average yield of .81 tons to the acre, from 11,552,000 acres. In 1936 wild hay production was 6,850,000 tons, with an average of .65 tons to the acre, from 10,579,000 acres. The alfalfa acreage was approximately 14,000,000 ac. in both 1937 and 1936 and exceeded the five-year average of 11,720,000 acres. (See ALFALFA.) The five-year average for all tame hay is 70,146,000 tons from 55,153,000 acres. For wild hay the five-year average is 10,719,000 tons from 13,288,000 acres.

(S. O. R.)

**Hayashi, Senjuro** (1876– ), Japanese general, son of Shishiro Hayashi, samurai, born in Ishikawa Prefecture. He has been director-general of the Military Training Department, War Ministry, 1932–34, Minister of War, 1934–35, Premier, Feb.–May, 1937. As War Minister General Hayashi endeavored to curb the more extreme groups among the younger officers, who held socially radical ideas. He felt morally obliged to resign, however, after one of his chief assistants, General Tetsuzan Nagata, had been murdered by a nationalist fanatic, Lieut.-Col. Saburo Aizawa, in Aug. 1935. General Hayashi reappeared on the political scene when he was appointed premier after a cabinet crisis in Jan. 1937. His predecessor, Mr. Koki Hirota, the present Foreign Minister, had resigned; and opposition from the army blocked the formation of a cabinet by General Kazushige Ugaki, who had first been entrusted with this task. At the end of March General Hayashi abruptly dissolved the Diet, accusing the legislators of not paying sufficient attention to their duties. The subsequent election was held under rather peculiar conditions, because both of the main parties, the Minseitō and the Seiyukai, had been criticized by Hayashi, and no political group of any size supported the premier. The results of the election revealed only minor changes in the composition of the new Diet and seemed to promise a deadlock between the premier and the Diet. This was avoided, however, because General Hayashi's cabinet resigned on May 31, giving way to a cabinet headed by Prince Fumimaro Konoye (*q.v.*). (W. H. CH.)

**Hayden, Charles** (1870–1937), American financier who as senior partner of Hayden, Stone & Company became a leading figure in Wall Street. Born in Boston, Mass., July 9, 1870, he was graduated from the Massachusetts Institute of Technology in 1890 and two years later organized in Boston with Galen L. Stone the banking firm of Hayden, Stone & Company. In 1906 the firm opened its New York office. Mr. Hayden extended his influence over many American industries, serving as chairman of the board of directors of the Chicago, Rock Island & Pacific Railway and the International Nickel Company, as chairman of the executive committee of the Cuba Cane Sugar Corporation, as chairman of the finance committees of the Kennecott, Utah, Nevada and Ray Copper Companies and as a member of the executive committee of the American Locomotive Company, Mack Trucks, Inc., Otis Elevator Company and Brooklyn-Manhattan Transit Company. The most noteworthy of his numerous benefactions was the planetarium bearing his name, for which he donated to the American Museum of Natural History in 1934 the sum of \$150,000. In 1933 he directed at President Roosevelt's request the Boy Scout Maintenance Fund campaign and in 1935 was appointed chairman of the Research Association of the Massachusetts Institute of Technology. He died in New York City, Jan. 8, 1937.

## Heart and Heart Diseases.

The greatest advance in our knowledge of circulatory disease lies in the present and future study of the causes of such disease, with especial view to their prevention. There are constantly new developments in our understanding of the way in which the heart and blood vessels are affected by all kinds of factors, and slight progress here and there has also been made in diagnosis, prognosis, and treatment. No outstanding discovery has been announced in the last year.

**Anatomy and Physiology.**—It is becoming more and more evident that the normal limits of heart size and rate and efficiency vary widely, making it very difficult to follow accurately as yet any set tables according to age, height, weight, or other easily calculated data. Family trends, the state of health, and physical training play important rôles not yet adequately recognized by those who are following limited criteria in the establishment of normal measurements, both anatomical and physiological, as for example in various tests of cardiovascular function and in X-ray studies. An illustration of this is in the determination of heart volume by X-ray (orthodiagraphy or teleroentgenography); although there is a gradually ascending curve according to body size there are wide limits of the normal range of heart volume for each body size and age. In other words we must still assess each individual case according to all the factors that we possess until such future time as we may have available adequate nomograms on which we may rely.

Anatomically and physiologically three interesting advances have been made in relation to the blood vessels. Winternitz of Yale has discovered by delicate injection methods that the walls of some arteries are rich in minute nutrient vessels, called vasa vasorum; it has long been known that such small vessels exist, but it was not realized that they were so numerous. The contention that their presence may play a major rôle in the production of arteriosclerosis as the result of minute haemorrhages in the arterial walls has not, however, been proved. The other advances concern the veins and the lymphatics respectively, two parts of the circulation which have been relatively neglected. Edwards has studied the valves in the veins, and their position and action in detail, and, like Homans, has taken particular interest in measures, especially muscular exercise, which tend to prevent stagnation, infection, and thrombosis which may lead to serious embolism in the lungs, a condition which has apparently been on the increase in late years. Drinker has continued his study of the lymphatics and has found that they play an important rôle in tissue repair, the limitation of disease processes, and in the chemical and water balance in the body.

Further studies in cardiovascular physiology have made clearer the reflex sympathetic control of blood pressure by the mediation of certain sensitive areas in arteries and veins, particularly in the carotid sinus, aortic arch, pulmonary artery and veins, vena cava, mouths, right auricle, and mesenteric arteries. Also the speed of blood flow and the volume of circulating blood have been shown to be influenced by congestive heart failure, the speed decreased and the volume increased.

**Methods of Cardiovascular Examination** have developed slowly. The first two authoritative books on X-ray of the heart in the English language have been published this year, one by Hugo Roesler and the other by Chester Kurtz. Electrocardiography has come more firmly into its own with the final adoption of a routine chest lead in addition to the classical limb leads, and the realization of its great value in revealing otherwise concealed disease of the coronary arteries—a reason for routine electrocardiography by insurance examiners in the case of men of middle age or older who apply for large sums.

**Diagnosis of Heart Disease.**—The idea that the etiological

gnosis of heart disease is more important than the structural or functional diagnoses has spread apace and has proved of great value; it has helped, for example, in the understanding of rapidly developing enlargement and failure of the heart that may sometimes result from severe rheumatic fever or extensive coronary thrombosis. More analyses are being made and reported of the relative incidence of the various kinds of heart disease in various parts of the world, a vital step in the advance of our knowledge that is no more important than studies of their absolute incidence which still remain to be done. Not only may such studies help indicate the magnitude of the problem of heart disease but they are almost certain to reveal important clues as to the pathogenesis and eventual reduction of the most important causes, which are the rheumatic infection, high blood pressure, and arteriosclerosis, especially as it involves the coronary arteries. Congenital heart disease and certain other of the rarer types like pulmonary heart disease and nutritional disease have received special attention in the past year and are being removed from the remote and mysterious subjects which they once were.

**Treatment.**—The major interest in treatment is beginning to be diverted, as it should be, from zealous attempts to give relief to advanced heart disease and heart failure by radical and sometimes most bizarre methods to the more justified zealous attempts to treat the causes at their inception and to establish simple health measures in the case of cardiac patients which may retard increase of heart disease and postpone heart failure. Already a decrease is obvious in certain more enlightened parts of the world in the incidence of cardiovascular syphilis, hitherto a major problem, and of thyrotoxic heart trouble. No new drugs of importance have been introduced. Reparative surgery of heart and pericardium continues to advance with occasional cures of cases that would formerly have perished or have lived hopelessly crippled lives. (For statistics see PUBLIC HEALTH SERVICES.)

(P. D. W.)

**Eat and Heating:** see PUBLIC HEALTH ENGINEERING.

**Heavy Hydrogen** is the name applied to the isotope of the element of atomic number 1, having mass approximately two units. It has been given the name deuterium, and its nucleus is called the deuteron, two terms which are analogous to the names protium and proton for the atom and nucleus of the lighter isotope. The latter two terms are used but seldom, in general the lighter variety being referred to by the term hydrogen. The atomic weights of protium and deuterium are 1.0081 and 2.0148, respectively. The spins of the proton and deuteron are  $\frac{1}{2}$  and 1, and the magnetic moments 3.25 and 0.75 nuclear Bohr magnetons, respectively. The ratio of the abundance of hydrogen to that of deuterium in terrestrial sources is about 5,750, but up to the present deuterium has not been found in the sun. It appears that its large abundance on earth is due to some fractionation process such as the loss of the atmosphere of the earth when it was first formed, resulting in an increased concentration of deuterium in the residue. This suggestion is in accordance with our belief that the abundance of hydrogen on the earth is much less than its cosmical abundance.

Deuterium is separated from protium by the electrolytical method discovered by Washburn. This has proved to be the most efficient method for the separation of this isotope, though the distillation and diffusion methods have both been used with success. "Heavy water" or deuterium oxide is now manufactured commercially and is an article of commerce.

Since the discovery of deuterium in 1931 and particularly since its successful preparation in nearly a pure form in 1933, an enormous amount of experimental information has accumulated.

These data cover the fields of spectroscopy, the thermodynamics of isotopic compounds of hydrogen and deuterium, physical properties including the electric, magnetic, mechanical, optical, and thermal properties, and the use of deuterium in chemical kinetic studies of many kinds. Also, the biological effects of deuterium oxide have been investigated and deuterium has been used widely as a tracer in the study of intermediary metabolism. Among the most interesting applications is the field of transmutation reactions.

In the field of spectroscopy it has been found that current ideas of the dependence of spectra on the mass of atoms have proved to be correct in every respect where deuterium has been used to test such theories. This has proved to be true in the case of the molecular spectra of  $H_2$ ,  $HD$ , and  $D_2$ , and in general of the molecular spectra of diatomic hydrides.

In the case of polyatomic molecules the theory has not been so well understood and deuterium has here served to unravel many difficult points about the structure and spectra of molecules of these different molecules. In the field of thermodynamics again there are many cases of confirmation of previously known theory and an accumulation of a large amount of data where the theory is not so well understood. For the most part the large accumulation of data on physical properties still remains unorganized from the theoretical standpoint though some attempts have been made in this direction.

Deuterium has proved to be very valuable in the study of chemical kinetics. This is an interesting field of chemistry since the speed with which chemical transfers take place is an important consideration in the study of that science. It is also a field of very great difficulty because of the very complex character of chemical reactions and the really detailed information that is required for its understanding. The study of exchange reactions involving hydrogen, *i.e.*, reactions in which two compounds, say one containing light hydrogen and the other heavy hydrogen, exchange their isotopes, is a very simple type of chemical reaction which has helped to elucidate the mechanisms of many chemical reactions.

The use of deuterium as a tracer in biochemical studies has been important. Deuterium is not an entirely ideal tracer because its chemical properties are somewhat different from those of hydrogen and hence there is no certainty that once the course of compounds containing heavy hydrogen in animal organisms has been followed, that this is also precisely the course of compounds containing the light hydrogen.

The deuteron has been found to be one of the most effective projectiles used in modern high voltage machines for transmutation of elements. The bombardment of deuterium oxide with deuterons gives the most intense source of neutrons known at the present time. Also, high speed deuterons are most effective projectiles for other transmutations.

(H. C. U.)

**Heavy Nitrogen:** see ISOTOPES OF THE LIGHTER ELEMENTS, SEPARATION OF.

**Hejaz:** see ARABIA.

**Helicopter.** The word "helicopter" is used to define a heavier-than-air aircraft which lifts and flies on wings which rotate under power of a contained motor. Under this definition, the wings of the helicopter may rotate in a radial cycle about a vertical axis or in a cylindrical cycle about a horizontal transverse axis.

Up until 1937 all efforts to develop a successful helicopter resulted in partial or complete failure. In 1916, partially successful flight tests were made with the captive helicopter developed by Petroczy and von Karman (Austria). This machine, with two 20-ft. concentric radial two-bladed airscrews, rose vertically to a

height of 160 feet. Other partially successful helicopters were produced by Henri Breguet (France), Henry Berliner (U.S.), de Bothezat (U.S.), Etienne Oehmichen (France), Pescara (Spain), and von Baumhauer (Holland).

The most successful helicopter to date is the Focke-Wulf Fw. 61 (Germany). This machine, with two 23-ft. diameter three-bladed radial rotors turning about vertical axes arranged laterally on each side of the fuselage, flew on June 25-26, 1937, a total distance in closed circuit of 122.553km. (76.105mi.) at a speed of approximately 76m.p.h. Duration of flight was 1hr.20min.49sec.; altitude reached, 2,500 metres (8,200ft.).

Many believe the helicopter-type of flying machine has great promise in the efforts to improve safety, reliability and convenience of aviation.

(W. L. LEP.)

## Hemp

(FIBRE). Production of hemp fibre attracted attention as an economy crop in several countries where its admixture in the manufacture of textiles was officially ordered as a means of reducing purchases of cotton imports. The Greek Government decreed that an effort be made to develop hemp growing in that country and that 1,500ac. be planted to hemp in 1938. The Greek acreage was 200ac. in 1937. New methods of utilizing hemp waste are said to have been developed, including a process for the manufacture of hemp-waste wallboard, which can be used in building construction or stored as a cellulose supply for the manufacture of high explosives, just as wood pulp cellulose is stored for war purposes. Hemp fibre crops in the principal producing countries in 1937 were given as follows by the International Institute of Agriculture, the figures in parentheses being for 1936: Italy, 237,741,000lbs. (192,372,000). Germany, 14,872,000lbs. (9,929,000). Czechoslovakia, 10,694,000lbs. (12,711,000). France, 9,192,000lbs. (9,466,000). Bulgaria, 8,488,000lbs. (7,288,000). Austria, 176,000lbs. (184,000). No figures of the Russian crop, which is reported to be large, have been given out by the Soviet Government, although the present five-year plan is said to have called for the planting of 1,511,000ac. to hemp fibre in 1937. Russia's average annual production of fibre was 367,992,000lbs. for the five years ending in 1935. No figures for the Yugoslavia harvest are available, although the acreage planted was 141,000, a slight increase over 1936 when production was 114,532,000lbs.

**Hempseed.**—The production of hempseed is given by the Institute as follows: Germany, 11,089,000lbs. (7,604,000). Bulgaria, 9,714,000lbs. (5,325,000). Czechoslovakia, 7,477,000lbs. (8,379,000). Italy, 6,100,000lbs. (7,758,000). Austria, 132,000lbs. (127,000).

(S. O. R.)

## Heney, Francis Joseph

(1859-1937), noted American criminal prosecutor, was born in Lima, N. Y., March 17, 1859. His family moved to San Francisco when he was very young and it was as Attorney-General of Arizona Territory that he first established his reputation. In 1903 he gained national attention by his successful prosecution of Oregon land frauds involving several prominent officials. Five years later, he climaxed his career by securing the conviction of both San Francisco's mayor and political boss on charges of graft. After unsuccessful efforts to secure elective office, he turned to private practice in 1918. His death occurred at Santa Monica, Cal., Oct. 31, 1937.

## Hepburn, Mitchell Frederick

(1896- ), Premier of the Province of Ontario, Canada, was born at St. Thomas, Ontario, Aug. 12, 1896, the son of William Hepburn and Margaret Fulton, both Canadian born. He was educated at St. Thomas Collegiate Institute, spent three

years on the staff of the Canadian Bank of Commerce, and served overseas with Royal Air Force in 1918. Mr. Hepburn was first elected to the House of Commons in 1926 and was re-elected in 1930. In the same year he was chosen leader of the Ontario Provincial liberal party and when that party was returned to office at the general election, June 19, 1934, became Premier.

During 1937 Mr. Hepburn took an active part in opposing the entry of the Committee for Industrial Organization into Ontario labour ranks. This was the outcome of a strike of 3,700 motor workers at Oshawa, Ontario, on April 8. On April 14 Labour Minister David Croll and Attorney-General A. W. Roebuck of Mr. Hepburn's cabinet resigned in protest against this policy. Mr. Hepburn also stated that the Federal Government was not supporting his policy. Refusing to deal with the Committee for Industrial Organization representatives, he intervened in the strike and a settlement was reached on April 22. Largely on this policy he appealed to the people and was returned to office on Oct. 6 with 63 seats out of 90.

The breach between the Federal Ministry and Mr. Hepburn was further widened when in December the Prime Minister, Mr. Mackenzie King, deferred for consideration of Parliament a request for a licence to export power from Ontario to the United States.

(J. T. C.)

## Heredity.

More than a thousand papers concerning heredity were published in 1937, it is estimated, and these were in at least ten different languages. Under these circumstances all that can be attempted here is to select a few results that appear to be more important.

Snyder and Davidson have found that diphenylguanidine has a bitter taste to about 75% of the people tested, but is tasteless to the remaining 25%. Tasting appears to depend on a single dominant gene that is independent of the previously known gene for tasting phenylthiocarbamide. There is thus added a new member to the small list of widely distributed and easily classified genetic differences in man, and on such additions depends the chief hope of an adequate analysis of human heredity. Sonneborn has shown that clones of *Paramecium* may be classified, according to their conjugation reactions, into what must be considered different sexes. There results a technique for studying the genetics of this form that will certainly revolutionize our knowledge of heredity in the Protozoa. There is already reason to suppose that the principles worked out for higher organisms will apply with relatively little modification.

Blakeslee reports that a doubling of the chromosome number may be induced, in somatic tissues of a wide variety of plants, by treatment with dilute solutions of colchicine. Owing to the well known importance of polyploid forms in horticulture, a technique for their artificial production at will should be of great practical, as well as theoretical, value.

Numerous papers have appeared that deal with the developmental effects of genes. The results of tissue and organ implantations in *Drosophila* (Beadle, Ephrussi, and others), *Ephesia* (Kühn and others), the silkworm (*Kikawa*), and fowls (Willier and Hadorn), may be especially mentioned here. These studies may help in an attack on the manner of action of genes. In this connection geneticists are also interested in the recent biochemical advances in the study of proteins, enzymes, viruses, bacteriophage, and essential growth substances (vitamines, auxins, etc.).

The application of the methods and principles of genetics to the study of evolutionary problems has advanced during the year. Outstanding here is Wright's development of a general formula representing the effects, on mixed populations, of mutation, selection, migration, and inbreeding. Another important event is the publication of Dobzhansky's book *Genetics and the origin of spe-*

es, which gathers together for the first time the newer mathematical developments, the pertinent facts from genetics and cytology, and a mass of material from the field study of organisms under natural conditions.

The relation of the chromosomes to heredity has long been recognized, and has stimulated a vast amount of microscopical study of the chromosomes. The present year has seen a large number of publications in this field, dealing largely with the nature and structure of the salivary gland chromosomes of the Diptera, with the details of meiotic behaviour especially in structural hybrids and especially in plants, and with preliminary cytological surveys of new groups of organisms. (See GENETICS.) (A. H. St.)

**Hertzog, James Barry Munnik** (1866– ), South African barrister and statesman. A biography may be found in the *Encyclopædia Britannica*, vol. 11, p. 527. He has been prime minister from 1924 and minister of external affairs since 1929, and leader since its formation in 1934 of the United South African National party.

Gen. Hertzog, as representative of the Union of South Africa, attended the coronation ceremonies in London in May 1937, and the subsequent Imperial Conference; on his return he stated that the Imperial Government had failed to keep its promise regarding the handing over of the native territories to the Union, but it was later agreed that there had been a misunderstanding on this point. In September, opening the Government campaign before the 1938 elections, Gen. Hertzog made an important speech at Pretoria dealing with his country's relations to Europe and international politics; deploring the continuance of "wartime" psychology among European statesmen and peoples; and, while emphasizing his party's intention to promote native happiness, asserting that the native would be given no authority within or over the Government of the country.

**Hitler, Adolf** (1889– ? ), German statesman, was born at Braunau on the Inn in Austria on April 20, 1889. After residence in Vienna where, as a painter, he formed his anti-Marxian and anti-Semitic convictions, Hitler moved to Munich in 1912. Here, in August, 1914, he enlisted as a volunteer in a Bavarian regiment and fought throughout the World War. In July, 1919, at Munich he joined as "Number 7" Anton Drexler's German Workers' Party, which soon developed into the National Socialist German Workers' Party, popularly known as the Nazis (*q.v.*). Hitler quickly became its Leader (*Führer*) and for a time edited its official newspaper, the *Völkischer Beobachter*. In the so-called Munich Beer Hall Putsch of Nov. 9, 1923, Hitler attempted with Ludendorff, Göring, Frick, Streicher, Röhm and others to seize the Bavarian Government, but was arrested, tried for treason, and condemned to imprisonment at Landsberg. Here he dictated to his secretary, Rudolf Hess, his famous book, *My Struggle* (*Mein Kampf*), of which more than two and a half million copies were later sold, thus providing the author with an abundant income. It is in part an autobiography and in part an exposition of his ideas for the regeneration of Germany, and is hence sometimes called the "Nazi Bible." On his release from prison in December, 1924, as a result of a general amnesty, he devoted himself to building up various organizations to strengthen the Nazi party: Brown Shirts (*q.v.*), Elite Guard (*Schutz-Staffeln* or "SS"), Hitler Youth (*Hitler Jugend*) and other formations. With the aid of these, with efficient lieutenants, and with his magnetic oratory, his Nazi party grew rapidly in power, winning 12 Reichstag seats in 1928 and 230 in July, 1932. On Jan. 30, 1933, Hitler was appointed Reich Chancellor and began the social and political revolution establishing the "Third Reich." Upon Hindenburg's death on Aug. 1, 1934, Hitler succeeded him as president, but modestly refrained from using the title and is known simply as Reich Leader (*Führer*) and Chancellor. For events in Hitler's career from 1934 to 1937 see BERLIN; GERMANY; NATIONAL SOCIALISM. (S. B. F.)

**Hobson, Richmond Pearson** (1870–1937), American naval officer, who became a hero of the Spanish-American War because of his attempt to trap the Spanish fleet in Santiago harbour by sinking the collier "Merrimac" in the harbour mouth. On leaping from the wreck he was captured and imprisoned for more than a month in a Spanish fortress. His heroism was rewarded with the Congressional Medal of Honor. He resigned from the Navy in 1903, but his championship of naval supremacy in *America Must Be Mistress of the Seas* in 1902 was continued in *The Paramount Importance of Immediate Navy Expansion* of 1904. From 1907–15, he represented the 6th Alabama District in Congress and as a strict prohibitionist helped to organize the American Alcohol Education Association. He was born at Greensboro, Ala., Aug. 17, 1870, and was graduated from the U.S. Naval Academy in 1889. He died in New York City on March 16, 1937.

**Hockey:** see FIELD HOCKEY; ICE HOCKEY.

**Hodge, John** (1855–1937), British trade unionist and politician; born at Muirkirk, Ayrshire, Oct. 29.

Very early in life he formed, at Motherwell, the nucleus of the British Steel Smelters' Association, and in 1917 was active in the formation of the British Iron, Steel, and Kindred Trades Association and of the Iron and Steel Trades Confederation. He became president of both the Associations and of the Confederation, retiring in 1931. He unsuccessfully contested Gower, 1900, and Preston, 1903, before being returned to Parliament in 1906 as Labour member for Gorton. In 1915 he was elected vice-chairman of the Parliamentary Labour Party, and in the second Coalition Government he was Minister of Labour, 1916-17 (being the first occupant of this new post), and Minister of Pensions, 1917-19. In 1916-17 he served on the Mesopotamia Commission to enquire into the conduct of the Turkish campaign. He published in 1931 an account of his visit to King George V and Queen Mary under the title *Workman's Cottage to Windsor Castle*. He died at Bexhill, Sussex, Aug. 10, 1937.

**Hogs.** In the United States there was an increase from 42,948,000 to 44,418,000. For the first time in three years U.S. pork and lard exports increased, being above \$26,300,000 for the year, compared to \$26,005,000 in 1936. They were \$160,833,000 in 1929. Slaughter of hogs and pigs in the United States in 1937 was 31,400,000 compared to 36,055,000 in 1936 and a five-year average of 45,991,000. The severe droughts, which in several years since 1930 greatly reduced the number of hogs in the U.S. are still perceptible in effect. Hog prices in the United States in 1937 declined about 46% from midsummer to December, or from \$13 to \$8. During the year the United States imported 74,830,480lbs. of pork, compared to 41,843,011 in 1936. Of this 2,337,000lbs. was bacon and 17,368,000lbs. other pork from Canada. The number of hogs in Europe declined during 1937 in most important producing countries, excepting Czechoslovakia and Hungary, following a large increase in 1936 and then higher feed prices in the first half of 1937. Denmark was said to be unable to supply its demands from the United Kingdom and other countries owing to a shortage of hogs, which on Nov. 20 were reported to number 2,918,000, compared to 3,516,000 in Nov., 1936. The German hog census of Sept. 4 showed 25,393,000 hogs, which was 2.4% below 1936, owing to the marketing of brood sows. The Government-controlled market in Germany gives a premium of 2.2 cents a pound for hogs weighing more than 300lbs. as compared to hogs weighing less than 200 pounds. Seasonal variation in prices are also fixed to encourage farmers to carry hogs through the winter and thus maintain a steadier supply for summer markets. The number of hogs in England and Wales decreased from 3,803,800 in 1936 to 3,632,300 in 1937; in Canada, from 4,145,000 to 3,963,000. (See also LIVESTOCK.)

(S. O. R.)

**Holland:** see NETHERLANDS.

**Home Building, Federal:** see FEDERAL HOME LOAN BANK SYSTEM; HOUSING.

**Honduras,** a Central American republic; language, Spanish; capital, Tegucigalpa (pop. 50,000); President, General Tiburcio Carías Andino. The area is 46,332 square miles. Population by the 1935 census was 962,000 and was estimated at 974,025 in 1936. The two outstanding events of the year 1937 were a revolution in the outlying districts in February, which was suppressed by aeroplanes, and the boundary dispute with Nicaragua (see NICARAGUA). Behind the revolution lay serious economic difficulties engendered by the abandonment of many banana plantations because of "Panama disease." President Carías maintained a very precarious control, with only the army receiving regular pay. Foreign trade in 1936 declined 10%, although a slight betterment was discernible in 1937. Imports in 1936 totalled

ONE STAGE in the highly specialized work of growing hops. A professional still-walker strings wires on sixteen-foot poles for vines in a Kent, England, hop garden

\$8,723,130; exports (chiefly bananas, with some gold) aggregated \$9,215,212. Most of the foreign trade is with the United States

Honduras has approximately 600 miles of railways and 250 of intercoastal highway. External communication is by steamer and an American Airways. The monetary unit is the lempira (value of U.S.).

The 1937 budget called for \$5,715,850, with slightly over 5% allotted to education. In 1936, there were 789 schools and 5,318 pupils.

**Hongkong**, consisting of several islands and part of the mainland at the mouth of the Canton river on the Chinese coast, is a British Crown colony ruled by a governor with executive and legislative councils; area, 32 sq.mi.; population (est. 1937) 1,010,000 (including 22,250 non-Chinese civilians). Capital, Victoria (pop. c. 400,000). Hongkong has a university; the total school attendance is about 75,000. Sir Geoffrey Stafford-Northcote succeeded Sir Andrew Caldecott as governor during 1937.

Although no hostilities occurred in the colony during 1937, extensive defence measures were undertaken as a result of the Sino-Japanese conflict; works were erected on the frontier to prevent the entrance of panic-stricken troops, and every citizen was required to purchase a gas-mask. In December assurances were given by Japan that her navy would respect the integrity of Hongkong and its territorial waters.

On Sept. 2 a severe typhoon struck Hongkong, accompanied by a tidal wave, by which much material damage was done and some hundreds of persons drowned.

Hongkong's trade is mostly with Great Britain, Eastern lands, and the United States. Its imports in 1936 were valued at £30 millions and its exports at £25 millions. Revenue and expenditure were £1,875,000 and £1,844,500 respectively.

**Hops.** The six principal hop-growing countries of Continental Europe, Germany, Czechoslovakia, Poland, France, Yugoslavia and Belgium, produced about 56,800,000lbs. of hops

in 1937, as estimated by the Central European Hop Association. This compares with a crop of 68,343,000lbs. in 1936. In England and Wales the 1937 crop was estimated at 26,000,000lbs. from 18,093ac., as against 28,224,000lbs. from 18,077ac. in 1936. In the Pacific Coast States of the United States production was estimated at 44,399,000lbs. in 1937, compared to 25,156,000 in 1936 and 47,746,000 in 1935, with a yield of 1,302lbs. per acre in 1937, as against 1,200 in 1936. Labour shortage and market conditions caused the 1937 crop to be left on the vines. Government control in many resulted in decreasing the 1937 acreage by 15%, but Government guarantee of a minimum price has resulted in a larger yield per acre. In

Czechoslovakia Government control has not succeeded in reducing the acreage but has managed to stabilize it since 1934, in conformity with a policy similar to that of Germany, which proposes production for domestic needs only until prices are better. Poland and Yugoslavia increased their acreages in 1937. (See also MARKETING BOARDS.) (S. O. R.)

**Hornaday, William Temple** (1854-1937), American zoologist who was first director of the New York Zoological park (1896-1926). An account of his championship of American wild life including his founding and presidency of the Permanent Wild Life Protection Fund may be found in the *Encyclopædia Britannica*, Vol. 11, p. 751. In 1931, he added to his works on animal life *Thirty Years' War for Wild Life*, an account of this fight. He died in Stamford, Conn., March 6, 1937.

## Horniman, Annie Elizabeth Fredericka

(1860-1937), British theatrical producer, was born in London Oct. 3, 1860. Her work at the Abbey Theatre in Dublin and the Gaiety Theatre of Manchester won international recognition. In 1933 she was made a Companion of Honour by King George V. She died in London, Aug. 6, 1937. See the *Encyclopædia Britannica*, vol. 11, p. 753 for further information.

**Horse Racing.** During the season of 1937 the racing of thoroughbred horses reached an expansion exceeding anything previously of record. The gross sum of \$14,363,562 was distributed to the winners of stakes and purses in North America. The largest sum previously recorded was \$13,935,610, in 1927. During 1936 it had been \$12,994,605; showing a gain of \$1,368,957. Considering that the year was one marked by a severe business recession, much political, social and labour unrest and other features usually inimical to the progress of turf affairs,

WUEL D. RIDDLE'S War Admiral  
Winning the sixty-third Kentucky Derby

this was, superficially at least, a remarkable result. The chief underlying cause may be that the race tracks have become great revenue producers through taxation. They now pour millions of dollars into the treasuries of many different states, which have created racing commissions to supervise their conduct; and, whereas legislation, generally speaking, tended to be repressive in the past, it is now stimulative, in some commonwealths meetings having actually been prolonged in order to meet the tax demands made upon them. These taxes are levied upon the gate and upon the betting receipts and assume also varied forms, making it imperative, in order to support them without a deficit, that the operation should be upon a large scale. These conditions have, for the most part, grown up in the past half-dozen years. No longer ago than 1933 the gross amount of money raced for was but \$8,516,325. Since that year there has been a tremendous growth not alone in the financial status of the sport but in the number of meetings, the number of horses appearing at them and the number of races run. There are now over 2,000 separate and distinct racing days annually, with over 15,000 races run and over 10,000 different horses participating in them.

In 1937 some eighteen different racing associations distributed over \$300,000 each in stakes and purses, of which six distributed over \$500,000 each; the leader being Santa Anita park, near Los Angeles, California, with \$754,760; it being significant of the conditions outlined above that this organization did not come into the field until the late winter of 1934.

The leading owner of 1937 was Charles S. Howard, of San Francisco, whose horses race in the name of his wife and were the winners of 58 races and \$212,859; with the Milky Way stable of Mrs. Ethel V. Mars, of Chicago, second with 46 races and \$209,925. The leading winning horse of the season was the four-year-old colt Seabiscuit, of the Howard stable, he taking 11 races and \$168,580. Third on the list was the Glen Riddle stable, of Samuel D. Riddle, of Glen Riddle, Pennsylvania, with 17 races and \$176,140. Mr. Riddle's three-year-old colt War Admiral was undefeated in eight races and the winner of \$166,500. The richest race of the year was the Santa Anita Handicap for all ages, run at that course on February 27, which netted the winner, Rosemont, a five-year-old horse owned by Mr. William du Pont, Jr., of the Foxcatcher Farms stables, Wilmington, Delaware, \$90,700.

The season upon the harness turf was likewise the most successful for a number of years past. Compared with the thoroughbred turf, it is very modest in the amount of money and the volume of racing, but in genuine sporting values it successfully challenges comparison. The great event of the year was the lowering of the world's record for trotters in single harness from 1:56 $\frac{3}{4}$  (standing since 1922) to 1:56 by the grey five-year-old gelding Greyhound, owned by E. J. Baker, of St. Charles, Ill., and driven by S. F. Palin. Second only in interest and importance was the lowering of the three-year-old record from 1:59 $\frac{1}{4}$  to 1:58 $\frac{1}{4}$  by the bay colt Dean Hanover, driven by the daughter of one of his owners, Miss Alma Sheppard, a little girl but eleven years of age. The most valuable trotting event of the season, the Hambletonian Stake, was won by the bay three-year-old filly Shirley Hanover, like Dean Hanover bred and owned by the Hanover Shoe Farms, of Hanover, Penna. She was driven by Henry Thomas. (J. L. HE.)

**Great Britain.**—The flat-racing season was remarkable chiefly for the failure as three-year-olds of the horses that had been considered the best two-year-olds twelve months previously. For example, the winner of the Derby, Midday Sun, was not even thought of in connection with the Epsom classic race until after he had won the Free Handicap Sweepstakes only six weeks earlier. Midday Sun belongs to Mrs. G. B. Miller, who thus became the first woman-owner to win the Derby, if the victory gained by Lady James Douglas with Gainsborough in a war-time substitute

Derby at Newmarket is excepted. Midday Sun also finished third in the Two Thousand Guineas and the St. Leger, and undoubtedly had the most consistent classic record of the three-year-old colts. The Two Thousand Guineas went to France through the success of Monsieur E. de St. Alary's Le Ksar, whose trainer, the late Frank Carter, thought so little of his charge's chance that he did not trouble to go to Newmarket to see the race. Chulmleigh, owned and bred by Lord Glanely, won the St. Leger at Doncaster in the style of a good staying colt, and is expected to have a successful season in 1938 before being retired to the stud. The two classic races for fillies were both won by Exhibitionist who, like Midday Sun, is by Solario. In fact, Gainsborough, the sire of Solario, was responsible for four classic winners, as Chulmleigh is by Singapore, another of Gainsborough's stock.

Solario easily headed the list of winning sires, 16 of his progeny having won 26 races to the value of nearly £53,000 between them. The Phalaris horse, Fairway, came second, Blandford, now dead, third and Singapore fourth. It is interesting, from a breeding point of view, to recall that Solario, Fairway, and Singapore all won the St. Leger of their year.

The Aga Khan headed both the winning owners' and winning breeders' lists, his own horses having won more than £30,000 and those bred by him just over £46,000. Other prominent winning owners were Sir Abe Bailey, Sir Victor Sassoon, whose first class successes were gained by Exhibitionist, and Mr. William Woodward, whose St. Leger winner of the previous year, Boswell, won the valuable Eclipse Stakes at Sandown park. Mr. Woodward, who is chairman of the New York Jockey Club, also came second to the Aga Khan in the list of winning breeders, Sir Victor Sassoon being a close third, and Lord Glanely fourth. Mr. Woodward's horses are trained at Newmarket by Captain Cecil Boyd Rochfort, who won more money in stakes than any other trainer for the first time in his career. His total of more than £61,200 beat the Manton trainer, J. Lawson, by over £9,000; Frank Butters, who trains for the Aga Khan, coming third with nearly £49,000.

Gordon Richards, as seems inevitable nowadays, was once again champion jockey, having ridden 214 winners. The north-county rider, W. Nevett, was second with 110 winning mounts, eight more than H. Wragg, who was third.

Most of the big handicaps had unexpected results, starting with Marmaduke Jinks, who gained a narrow victory in the Lincolnshire Handicap on the third day of the season, starting at odds 33 to 1. William of Valence, French-bred, as his name indicated, made a name for himself by winning the Rosebery Stakes at Kempton park, the Lingfield Park Spring Stakes, and the City and Suburban Handicap at Epsom in successive appearances on the racecourse; but he achieved nothing of note afterwards. The Cambridgeshire was run before the Cesarewitch at Newmarket last season for the first time in the history of these two important handicaps. The reason for the change was the contention that horses could not compete in both events so long as the longer was run before the shorter. Actually no horse took part in both races. Artist's Prince won the Cambridgeshire, and Punch beat the previous year's winner, Fet, in the Cesarewitch. (A. K. B.)

**Horses.** The number of horses throughout a large part of Europe and Australasia increased during 1937, but decreased in the U.S., Canada, England, Wales, France and Italy. The decline in the number of horses and colts on U.S. farms was from 11,445,000 valued at \$1,141,911,000 on Jan. 1, 1937, to 11,163,000, valued at \$1,013,960,000 on Jan. 1, 1938, the U.S. Department of Agriculture reports. As of the same dates mules and mule colts on U.S. farms declined in number from 4,571,000 valued at \$597,156,000, to 4,477,000, valued at \$593,898,000.

For the last 18 years the number of horses and mules on U.S. farms has declined at an average annual rate of about 2.2%. Currently there has been a steady increase in the number of tractors, trucks, automobiles, and motorized tillage and harvesting machinery on U.S. farms. Even during the worst depression years before 1933 the rate of increase in tractors advanced, although in a lesser degree than before 1929 or since 1933. It is estimated that there are now in excess of 1,200,000 tractors on some 6,000,000 U.S. farms. The number of colts increased during 1937 in the U.S., but the mortality among older animals was unusually high owing to the large number of aged horses on the farms. The average value per head was \$90.83 in 1937. In 1936 it was \$99.06 per head.

In Canada the horse and colt census on farms in 1937 was 882,990, which was 8,550 fewer animals than in 1936. In England and Wales the loss was 7,500 head, from 865,600 in 1936. Scotland remained practically stationary, 147,000 in 1936 and 146,800 in 1937, while Northern Ireland increased 100, to 90,900 head. In France there were 2,810,000 horses and colts in 1936 and 36,000 fewer in 1937; in Italy, 816,270 in 1936 and 19,580 less in 1937.

Poland registered the largest increase of horses and mules in 1937 by an increase of 59,000 head, to 3,883,000. Belgium had a larger relative increase, 31,698, which raised the 1937 total to 163,104, while in Germany the increase was 17,224, to 3,430,000 head. New Zealand gained 1,629 head, to 277,799; Yugoslavia, 5,254, to 1,216,085; Czechoslovakia, 8,832, to 703,835; the Netherlands, 4,846, to 299,989; Norway, 4,115, to 189,583; Hungary, 3,787, to 798,066; Latvia, 3,178, to 391,948; Lithuania, 8,820, to 549,700. (See also SHOWS: *Horses*.) (S. O. R.)

**Horseshoe Pitching** was officially recognized in the U.S. for the first time by the A.A.U. in 1937. The sport really made more headway in Chicago than anywhere else due to the pioneer work of Hodgson Jolly of the national committee and his associates, including George Chumard of Cincinnati.

In the first senior national A.A.U. horseshoe-pitching championships, held in Cincinnati, John Lindmeier, of the Center Club, of Chicago, won the amateur title and the John A. Gordon challenge trophy. Walter W. Lane was the runner-up; Arlo Harris, third; Charles Hill, fourth. The doubles title was captured by Walter W. Lane and Hubert Trinkle; the runner-up team comprised T. Henderson and Alan Boles. (J. B. P.)

**Horticulture.** An important event to flower growers in the United States has been the altered outlook concerning imports of bulbs. In future imports of narcissus bulbs in quantity will be possible, and this should strengthen the bulb-growing industry in the States. Of even greater importance is the withdrawal of the scheme which hitherto fixed a minimum price for the bulbs exported from Holland; this will have world-wide repercussions.

Despite industrial depression, the flower-growing industry in the United States is holding its own. The long-stemmed American rose still leads the world; Red Hoover and Murray (salmon rose) are new introductions of note. Pot plants continue to gain in importance; the spiraea, named varieties of *Saintpaulia*, *Kalanchoe bulbifera* var. *coccinea*, the White Easter Greeting dahlia (grown for the Easter market). For many years only the white freezia (*refracta alba*) was known as a florists' flower, but there are now available many improved varieties and many different colours. These include Elder's Giant White, Daffodil (yellow), Her Grace (blue), Maryon (lavender), and Robinetta (deep red).

In England the Coronation has had a noticeable influence on the

flower industry. There was a marked increase in the demand for cut flowers and flowering plants in pots; blue iris, white and blue hydrangeas, red rhododendrons, geraniums, and tulips in particular were produced in greater quantities than ever before, and all found a good market. In fact, 1937 has been throughout a good year for the flower grower.

**Bulb Flowers.**—Among cut flowers, bulb flowers from the open field and under glass are the most important in the English flower industry. Of daffodils, King Alfred remains the outstanding public favourite, while progress during the year has been noticed with the varieties Dawson City, Helios, Forerunner, Fortune, Mrs. Barclay, and Cheerfulness. Daffodils are now available by Christmas through the use in the forcing houses of "prepared" bulbs; i.e., those given treatment in cold storage before boxing. Many more tulips, however, are forced in England than any other bulb flower; of these William Copeland, Bartigon, and William Pitt are still the leading varieties, but Rose Copeland and Carrara (white) are making progress. English growers are now propagating hyacinth bulbs instead of buying small bulbs from Holland for growing on; these English hyacinths, in common with all British bulbs, have made notable progress, and there has been built up in England a live and progressive bulb industry.

**Anemones.**—A striking development has been the increase in anemone production in the west of England since the introduction of tariffs in 1931—this increase being from under 50 to over 400 acres. Improvement in the colour range has been secured by careful selection and by the introduction of named varieties of distinct colours, such as Hollandia (scarlet), the Bride (white), Lord Lieutenant (blue), Sylphide (magenta), the Admiral (double magenta), these magenta or wine-coloured varieties being recent introductions that have quickly become popular. Research work on anemones has shown the importance of deep cultivation of the soil which should have a definite pH value.

**Carnations.**—As a florists' flower the carnation ranks only after bulb flowers and chrysanthemums in importance in England. The original varieties were obtained from the United States, but of these only two, Lady Northcliffe and Pink Delight, are still grown. Of the newer varieties, such as Purity (white), Robert Allwood (scarlet), Pelargonium (fancy), and Tangerine have made progress, and exports of these and other promising varieties are being made to the United States. Expansion of the carnation industry continues.

**Orchids.**—The popularity of orchids has been maintained, and there has been a definite increase in the English production of cymbidiums and cattleyas which were formerly imported in quantity from Belgium. The cypripedium stocks, long grown in England, have been increased, and cut flowers in large numbers are marketed.

The flowers of the Dominions, which, incidentally, were a feature at the Chelsea Flower Show in 1937, include several which have won a permanent place in English horticulture. *Gerbera Jamesonii* and *Nerines* from South Africa are now important florists' flowers; *Gazania Ursinia* and *Venidium* are popular garden flowers.

**Gladioli** continue to make headway as florists' flowers, and much of this progress is due to the Canadian workers, who have developed especially the class of primulinus hybrids. *Palmer's Picardy* is now first favourite on the cut-flower market, where *Primulinus gladioli* are in great demand.

Miss I. Preston at Ottawa has introduced some valuable interspecific lily hybrids. Lilies are attracting more and more attention. Specialists are raising bulbs from seed in quantity, and supplies should soon be available to place lilies within the reach of all gardeners. (See also SHOWS: *Horticultural*.)

(H. V. T.)

**Hospitals.** Hospital fundamentals include plant and equipment, medical staff and auxiliary workers. Advances in hospital administration are achieved by improving these fundamental resources, by adjusting their relations, and by the adaptation of hospital program to community need. In a huge non-regimented country like the United States, a country whose people are energetic, ambitious, and not lacking in interest in the public welfare, no widespread public service is ever at a standstill; but radical changes are rarely accomplished in any single year.

Hospital building plans in 1937 show increasing attention to functional needs. The requirements of chronic patients other than mental and tuberculosis patients have been studied intensively and an attempted solution of the problem in large-scale planning has been made by the hospital department of New York city. Out-patient departments have been improved by more liberal space allowances, and by improvements in diagnostic and therapeutic equipment; the sub-division of large public wards into smaller fixed units or their optional sub-division by means of curtained cubicles has been noticeable. Air-conditioning of operating rooms, X-ray departments, and other special units has been extended. Air-conditioning apparatus for patients' single rooms has been extensively used and several attempts have been made at air-conditioning of entire hospitals. Oxygen therapy as a specialized application of air-conditioning, has been more widely used than before.

Many rural hospitals now possess adequate laboratory and therapeutic equipment, partly as the result of local enterprise, partly due to the assistance of private foundations; this improvement has been promoted by national medical organizations functioning as standardizing agencies.

The qualifications of clinical specialists serving in hospitals has been defined by competent professional groups whose standards have been more generally adopted as guides by the appointing authorities. Hospitals have sought to introduce into the educational content of the first interne year, and into the advanced training of residents who aspire to become specialists, elements of professional training prescribed by the American Medical Association and other interested bodies. Tentative agreements have been reached between representatives of hospital administration and spokesmen for the medical specialties on a suitable relationship between radiologists and anaesthetists on the one hand and hospitals on the other.

For many years the American Hospital Association has sought adequate means for the training of hospital executives. This year the Hospital Association signified its willingness to relinquish this task to the comparatively new American College of Hospital Administrators, which has published a report outlining a definite plan of action. An institute for hospital administrators, conducted in Chicago under university auspices, was well attended.

Surveys of local hospital needs have heretofore been made by important American communities, including Cleveland, St. Louis, Philadelphia and Memphis. In 1937, the Hospital Survey of New York completed for New York city and the neighbouring metropolitan territory a survey more ambitious in plan and scope than any heretofore attempted. Novel chapters in the report are those dealing with the essentials of good care of hospital patients, and a consideration of the number and character of professional and non-professional personnel and the conditions of employment. The principal recommendation of the New York survey report is a demand for the better control and co-ordination of institutions and agencies.

Under the leadership of paid organizers, the promotion of unions of hospital workers continues. A Union of Professional

Workers is seeking to enlist physicians and nurses in a single organization with laboratory technicians and pharmacists. The union movement has been met by hospital administrators with sympathy for workers whose needs have not in the past received reasonable consideration, but union organizers have discovered that there exists a widespread conviction that the strike is not a weapon that can properly be used against hospitals. In New York city, a sit-down strike by hospital employees resulted in a Supreme Court decision which declared that "the State and subdivisions thereof may not have their appropriate functions interfered with by strikes and neither may charitable, educational or religious associations or corporations. Chaos would result and the public health and welfare would be materially affected."

(S. S. G.)

**Housing.** The year 1937 saw important developments in the public housing history of the United States. For residential construction by private enterprise, see BUILDING AND THE BUILDING INDUSTRY.

The urban demonstration program of the Public Works Housing Division neared completion. By December, construction was 88% complete. One project, Techwood, at Atlanta, Ga., had been finished and occupied in 1936. Twenty-five were occupied during 1937, containing altogether 9,948 dwelling units. The remaining 26 by the end of the year were selecting tenants or receiving applications. These 52 projects are located in 41 communities in 20 States, the District of Columbia, Puerto Rico and the Virgin Islands. They contain 21,770 small dwellings and flats. The locations are widely distributed among the North-eastern, South-eastern and Central States, but have not reached the West. More than half involve slum clearance with rehousing on the site. In some other cases the city has undertaken to demolish as many unfit housing units as were built. Nearly half of the projects are for Negro tenants, who suffer from bad housing more than any other group.

Like all other public construction under the Federal Emergency Administration of Public Works, these housing projects have enjoyed a 45% capital grant from the National treasury, neither more nor less than the countless school-houses, sewer systems and town halls built during the depression. The George-Healey Act of 1936 provided that, in the housing projects, the other 55% of cost should be repaid to the Government, principal and interest out of rents, and that no tenants should be accepted whos

MODERNISTIC APARTMENT HOUSES in Tel Aviv, the all-Jewish industrial city founded in Palestine in 1909, which in 1937 had a population of 150,000

family income was more than five times the rent. Standards of lay-out, construction and equipment are high. They have been criticized as too high. It is to be hoped that economies may be achieved through further experience and decentralization without sacrificing standards.

Basic rents (comparable to those charged by private enterprise) are generally in the neighbourhood of \$5.00 per room per month. Confusion has been caused by the additional \$1.00 to \$2.00 for service charges not usually included in rent—electricity for light and refrigeration, gas for cooking—or only included in higher priced apartments as steam heat and hot water supply. The lowest average rent is \$2.24 per room in Caguas, P.R., with no utility included except water. The highest is in New York at Harlem river houses, \$7.12 per room per month including heat in winter and hot water at all times, or \$8.52 including also light, refrigeration and cooking fuel.

The two New York city projects have been leased to the New York city housing authority for management. Leases have been signed with the Chicago housing authority for the projects in that city, and a number of others are being negotiated. Pending lease or sale to local housing authorities, management is controlled from Washington.

Rural housing built by the Resettlement Administration and its predecessors involves too many non-housing considerations for discussion here. Its three garden suburbs created near Washington, Cincinnati and Milwaukee are important as object lessons in enlightened community planning for healthful and pleasant living. Constructed with relief labour, their cost proves only that relief labour is expensive. Greenbelt, the Washington suburb, received its first tenants in September.

The United States Housing Act of 1937, setting up a permanent United States housing authority in the Department of the Interior, sponsored by Senator Robert F. Wagner and Representative Henry R. Steagall, was passed just before Congress adjourned in late August. Nathan Straus of New York, appointed Administrator by President Roosevelt, took office November 1. At the same time, the records, personnel and projects of the housing division were transferred to the new authority.

The act embodies the first national public housing policy and program for the United States. It provides complete decentralization to local housing authorities of responsibility for initiation, construction, ownership and management of housing projects. The United States housing authority will set standards, but is essentially a fiscal agency. It will make loans up to 90% of necessary capital, the remainder being contributed by State or local authority. Loans are to be repaid within an amortization period not

exceeding 60 years with an interest rate not more than 4%. Bond issues to provide money for loans cannot exceed \$500,000,000 in the next three years.

Aided projects must either include slum clearance directly or provide for equivalent demolition of unfit dwelling units, except in cases of proved shortage. To assure rents sufficiently low either a flat capital grant or an annual grant may be made, but not both. In either case, State or local housing authorities must provide 20%.

Congress, desirous of forcing economy, placed a maximum of \$1,000 per room on construction cost in towns under 500,000 population, and \$1,250 in larger cities. The 5 to 1 ratio of family income to rent is continued, except that families with three or more minor dependent children are allowed a 6 to 1 ratio.

States and cities since 1933 have been preparing for decentralization by State legislation declaring the clearance of slums an erection of low-rent housing for families of low income to be for public purposes. During that period sixty-one State and local housing authorities have been appointed. Ten States enacted such legislation during 1937. Eleven others amended earlier laws to bring them in line with the requirements of the national act. Nine States had earlier laws which they have not amended. Therefore, the prompt "earmarking" of loans aggregating \$136,250,000 by Mr. Straus to 32 cities in 16 States is of a provisional character, subject to their being able to make good at their end and in some cases subject to additional State legislation.

Harvard University Press, 1936; *Housing Officials Yearbook*, National Association of Housing Officials, Coleman Woodbury, Editor; *Federal Emergency Administration of Public Works*, Housing Division, Bulletin No. 2—*Urban Housing*, the Story of the PWA Housing Division, 1936. (E. E. Wo.)

**Europe.**—The year 1937 is perhaps most notable in the housing world for the fact that experts of all European nations and of the United States made the first collective serious investigation into a problem which had become peculiarly menacing everywhere—the question of horizontal or vertical building. Even in England where the continuous tradition of the single-family house with garden had been, it seemed, firmly entrenched, it was reluctantly accepted as a regrettable necessity that tower development should be allowed, and the London County Council, the biggest English local authority responsible for housing, reversed its policy so that while in 1929 only 5.6% of the houses erected were flats in 1937 4,866 out of a total of 7,504 were flats or apartment houses. These apartment dwellings, too, were erected mainly on sites which had to be cleared of old buildings. This departure from the English tradition was regarded with horror by many

England itself, and by Mr. Steen Eiler Rasmussen, the Danish architect, who wrote a notable book *London, the Unique City*, to show how anti-social such development is. European and American interest was, therefore, focussed on the discussions at the Housing and Town Planning Congress, one of a series organized as part of the *Quinzaine Internationale d'Urbanisme*, held in Paris in July. It was the object of the reports and the discussion to collate the views of many different countries on the initial cost, the management and upkeep costs, and the advantages or disadvantages of different types of housing, each applied to 5,000 persons on 50 hectares (123.5ac.) in single family dwellings of one or two floors, multi-family dwellings not exceeding four floors, or in tower buildings. Reports were received from Australia, Belgium, Denmark, England, France, Germany, Holland, Italy, Palestine, Poland, South Africa, and the United States. M. Jean Royer of France acted as general reporter, and the trend of the discussion revealed that prevalent opinion was strongly in favour of horizontal development and the single family house, and that only in exceptional cases should tower buildings be constructed.

This viewpoint was generally welcomed by that large section of housing opinion which regards the flat or dwelling as a lowering of housing standards. Growing discontent in all countries was apparent with regard to ribbon building of houses along main arterial roads, sporadic development, and scattered development, objection being taken not merely on the ground that such development was a menace to natural beauty, but that it was expensive and unlikely to provide the occupants of the houses with an adequate social life. For that reason experiments in planned group development have been watched with great interest. The

REPLICA OF 300 FLATS and gardens, especially designed to provide homes for Nazi patriots, in Berlin's new "Dr. Josef Goebbels Settlement"

experiment of the United States Resettlement Administration in creating three Greenbelt towns—described as communities built on raw land, in which every acre is put to its best use, and in which the traditional dividing lines between town and country are broken down . . . each of them surrounded by a broad girdle of park and farmland—is being watched throughout the world, and particularly in Europe, with special interest. A modification of the English Garden city idea, the Greenbelt town falls short of Howard's ideal only in the scanty provision of zones for industry. A similar departure from suburban peripheral development, now extensively practised but unanimously condemned, is the satellite township of Kincorth, near Aberdeen, Scotland, a competition for the design of which created widespread interest. A rising feeling not only for rehousing but for housing of good quality was symptomatically expressed in this connection, in a strong demand that the houses and public buildings in this new community should be built of local stone, *i.e.* Aberdeen granite.

At the same time, there is apparent everywhere a tendency to accept new styles and new materials. In Scandinavia, of course, the building of timber dwellings and pre-fabricated dwellings by the tenants themselves at a cost of £240-£250 goes on apace but makes slow but, nevertheless, significant progress in Great Britain. Similarly, modern architectural styles in domestic building begin to make their appearance in England, styles which found immediate acceptance in Germany and Czechoslovakia after the war. The 4-inch reinforced concrete house made its first appearance in Britain in 1933; in 1937 concrete was established as a convenient and distinguished medium, avoiding fussiness and securing economy of plan and function. Nevertheless, brick continues to be the most general medium, and in it, too, noteworthy houses have been erected.

Two other events in Great Britain are worthy of mention as

pointing to a growing care for good building. One was the announcement in April 1937 of a scheme by the National Trust, departing in many ways from the successful *La Demeure Historique* system in France, whereby old historic houses may be preserved at the expense of the trust, the owner being allowed to maintain in residence and being exempt from all income tax and death duties. The other was the formation of the National House Builders Registration Council, which, having adopted standard specifications, issues a certificate to house purchasers guaranteeing that the construction is as set out. This move to prevent jerry-building won the approval of the Ministry of Health, but is not yet as widely known to the general public as is desirable.

Central heating schemes, applicable to detached and semi-detached houses, were started by the city architect of Dundee, Scotland, and designed by Donald V. H. Smith, some 15 years ago. The total cost of the plant was £59,000 but against this nearly £40,000 was saved by the omission of flues, fire-places, etc., leaving the net cost at £19,000. A report issued in 1937 shows that in 12 years the profit from the undertaking has cancelled more than half the net capital cost. The estates involved were especially scattered, while the charge to householders, namely, 2s. 8d. represents a substantial economy in heating costs, while supplying constant hot water. The importance of this scheme as a balancing factor in estimating the desirability of cottages as against flat development or apartment development will be increasingly recognized.

In Russia, and particularly in Moscow, efforts are being made to raise the standard of living accommodation to a level similar to that obtaining in English municipal cottages: the Mossoviet is aiming at a standard of 12 sq. metres per person, i.e., 48 sq. metres (480 sq. ft.) for a family of four. Flats are definitely preferred in Moscow because, say the inhabitants, "we have always lived in flats and see no reason to change." Overcrowding is appalling, and in order to reach the standard laid down, a ten-year program is envisaged totalling 15,000,000 sq. metres of accommodation; the 1937 share of this task was 1,000,000 sq. metres, an increase of 200,000 sq. metres over that provided in 1936. The necessary output will have to be increased to 2,000,000 sq. metres per year if the program is to be completed, but in the meantime building is restricted because of war or defence preparations.

This is true of practically every European country where house building has been seriously affected by the competition in armaments, by the growing scarcity of building materials, and even, despite widespread general unemployment, of building labour. This problem will, perhaps, engage the attention of the new International Federation for Housing and Town Planning, formed in 1937 by the linking of the organization of that name with the International Housing Association of Frankfurt. Mr. G. L. Pepler was appointed first president of the new organization, which holds its first congress in Mexico City in Aug. 1938, and which has set up administrative offices in Brussels. (See also ARCHITECTURE; BUILDING AND BUILDING INDUSTRY; STATE LEGISLATION: *Housing*; TOWN AND CITY PLANNING; UNITED STATES: *Congress*; WASHINGTON.) (F. R. Y.)

**Howe, Edgar Watson** (1853-1937), Kansas editor and philosopher, was known as "the Sage of Potato Hill." Born at Treaty, Ind., May 3, 1853, he entered the newspaper field by publishing *The Golden (Col.) Globe* at the age of 19. Four years later, he founded *The Atchison (Kan.) Daily Globe* of which he was the editor and publisher until 1911. From that date until 1933, he edited *E. W. Howe's Monthly*, which with his twenty-eight books established his reputation for composing pithy paragraphs. His first book, *Story of a Country Town*, was an immediate success which reached fifty editions during his life-

time despite the fact that publishers' rejections forced him to print it on his own presses. Thereafter one book followed another in rapid succession until his death at Atchison, Oct. 3, 1937.

**Howland Island**, an island in the Pacific ocean, latitude 0° 49' north, longitude 176° 42' west, approximately 1,620 mi. south-west of Honolulu, Territory of Hawaii. It was discovered by Captain George E. Netcher of New Bedford, Mass., in 1842, and taken possession of by the United States in Feb. 1857 by A. C. Benson of the American Guano Company. In 1872 the "U.S.S. Narragansett" surveyed Howland island and found it to be about two miles long, north and south, one-half mile wide, 18 or 20 ft. high, of coral formation, and with a fringing reef. A clump or two of brushwood near the centre of the island and a little grass on the ridge is all the vegetation it affords. Slightly brackish water can be found by digging a few feet. Executive Order No. 7368 issued by the President of the United States on May 13, 1936, placed the island under the supervision of the Division of Territories and Island Possessions, Department of the Interior. Four Hawaiians have been placed on the island for the purpose of obtaining certain meteorological data which is desired in connection with the possible development of air routes to the Southern Hemisphere. (E. GRU.)

**Hubay, Jenő de** (1858-1937), Hungarian violinist and composer, sometimes known as Eugen Huber, who during the latter part of the 19th century was recognized as one of the greatest virtuosi and whose methods of violin teaching made him famous. He died in Vienna, March 12, 1937. For an account of his musical career and compositions, see the *Encyclopædia Britannica*, vol. 11, p. 855.

**Hughes-Stanton, Sir Herbert** (EDWIN PELMAN) (1870-1937), R.A., British artist; born in London. His father was William Hughes, a well-known flower painter, but Sir Herbert took the additional name of Stanton. His art was self-taught, and he was, from an early age, an exhibitor at the Paris Salon, the Royal Academy, and several other exhibitions. He was elected A.R.A., 1913, and R.A., 1919; and was in 1915 elected a member of The Royal Society of Painters in Water-colours, becoming its president in 1920. In 1923 he was knighted. Sir Herbert's best work was done as a landscape painter in water-colours. His "A Pasturage among the Dunes," was bought for the Chantry Bequest in 1908, and specimens of his work are to be seen in the Tate Gallery, and in galleries in most of the larger English cities, as well as in the Luxembourg, Rome, Florence, and other European galleries. He died Aug. 2, 1937.

**Hull, Cordell** (1871- ), American statesman, was born Oct. 2, 1871, at New Pickett, Overton county, Tenn. He studied at the National Normal university, Lebanon, Ohio, 1889-90, and in 1891 graduated B.L. at the Cumberland University Law school. He served in the Spanish-American War as a captain of Tennessee infantry and began legal practice at the Tennessee bar. He sat in the State House of Representatives, 1893-97, and was a State judge, 1903-07. In 1907, he began a long and distinguished service in Congress. With one brief interval—1921-23—Mr. Hull was member of the House. From 1921-24, he was chairman of the Democratic National Committee. In 1931 Tennessee elected him a Senator, a position that he resigned in 1933 in order to become President Roosevelt's secretary of State. In the domestic field of constructive statesmanship, Mr. Hull is remembered as the author of the Federal Income Tax law of 1913 and of its revision in 1916. Internationally his name is as-

associated with the "good neighbour policy." In 1933, he enunciated his policy before the Pan-American Congress at Montevideo and the practical application of this policy has been the negotiation of trade agreements with foreign countries in the Americas and elsewhere. Secretary Hull represented the United States at the London Economic Conference, 1933. In Dec. 1936, he attended the Pan-American Peace Conference in Buenos Aires. On his return he held conferences with Lord Runciman, president of the British Board of Trade and in February secured from Congress an extension of his power to conclude reciprocal trade agreements. March developments were featured by a long correspondence with Germany over a derogatory speech by Mayor LaGuardia of New York and the resulting criticisms of the United States in the German press. In April the secretary received the Woodrow Wilson Foundation Medal and urged abandonment of competition in armaments as a step toward insuring peace. With the outbreak of hostilities between Japan and China in early July, however, the international situation grew worse instead of better. Secretary Hull urged withdrawal of U.S. citizens from the war areas, but insisted upon protecting those remaining. The bombing of the "President Hoover" in August and the sinking of the "Panay" in December forced energetic protests from the secretary and made it clear that 1938 would be a year of even greater responsibility for the man who at home and abroad had won confidence as a liberal-minded, well-informed and efficient executive of broad views, expressed with courtesy and discretion.

**Hungary**, a kingdom of central Europe and member of the League of Nations. Bounded W. by Austria, N. by Czechoslovakia, E. by Rumania, S. by Yugoslavia. Regent, Admiral N. Horthy. Flag, red, white, and green in horizontal stripes, with crown and arms in centre.

**Area and Population.**—The area is 35,911 sq.mi.; population (Dec. 1936) 8,989,000. According to the 1930 census, the habitual language of 89.3% of the population was Magyar; of 6.8%, German; of 1.7%, Slovak; 64.9% of the population are Roman Catholics, 2.3% Uniates, 27.1% Protestants of various denominations, 5.1% Jews.

Education is compulsory and universal. It is in the hands,

partly of the State, partly of the Churches, which enjoy wide autonomy in this and other respects. The largest cities, with populations as on Dec. 31, 1936, are: Budapest, 1,051,804 (including Greater Budapest, 1,421,397); Szeged, 139,546; Debrecen, 125,337; Kecskemét, 82,329; Pécs, 70,399; Miskolc, 60,145.

**History.**—In the absence of a king, Hungary is governed by a Regent and a Parliament consisting of an Upper and a Lower House. On July 1, 1937, a bill was enacted increasing the powers of the Regent and making provision for the appointment of his successor. A strengthening of the powers of the Upper House is also planned, but a promise has been given that this shall come into force only simultaneously with the bill reforming the suffrage, which is still open outside the large towns. The last-named measure, repeatedly promised by M. Darányi, the present premier, as by his predecessor, was introduced on Dec. 30. The bill provided for secret and direct suffrage for males of 26 and females of 30, subject to qualifications of education and residence.

The real interest in Hungarian politics centred upon the alleged increase of German and Nazi influence, which was favoured by those who appreciated authoritarian methods, or hoped for German help to recover Hungary's lost territory, but watched with great anxiety by other sections of the population. Several attempted coups, more or less farcical, were crushed during the year. There were warm affirmations of friendship with Austria and Italy, whose king visited Budapest on May 11. In the autumn, negotiations for a *modus vivendi* were attempted with the Little Entente.

Hungary was willing, not to renounce her revision aims, but to put them temporarily into cold storage. She demanded in return recognition of her equality of rights in armaments and a guarantee for the Magyar minorities beyond her frontiers. After dragging on in Sinaia and Geneva, the negotiations had to be postponed until after the elections in Rumania, the country which had found most difficult in giving the latter assurance.

**Trade and Communications.**—The basis of Hungary's economic life is still agriculture, in which 51.8% of the population is engaged. The principal crops cultivated are maize, wheat, potatoes, and sugar-beet. With the rise of world prices Hungary's economic position has improved considerably.

Industry has made a considerable recovery. The index of effective employment surpassed the 1929 figure throughout 1936 and was very little below it in the spring of 1937. The average of industrial activity for 1936 was 133 (average 1925-29, 100). Industrial unemployment has usually varied between 50-55,000.

Hungary's foreign trade has been much hampered by exchange restrictions, and by the absence of an extensive trade agreement with Czechoslovakia, formerly one of her chief markets and sources of supply. A new agreement concluded in 1937 improved the situation only slightly. The Rome Protocol, concluded in 1934 with Italy and Austria, assured a market for an important part of the Hungarian cereals crop. These had to be modified slightly in 1937, with the result of leaving Germany more conspicuously than ever as Hungary's chief market and source of supplies. In general, however, both imports and exports have shown a tendency to rise. Imports for 1936 were valued at 432,992,000 pengös, and exports at 506,649,000. Hungary was able in 1937 to resume a fuller service on her public debt, in part suspended.

The monetary unit is the pengö, nominally equal to 17.49 gold cents. There are considerable bonuses on the sale of foreign exchange. The budget for 1936-37 showed receipts estimated at 1,136.1 million pengös, and expenditure 1,211.8; the figures for 1937-38 were 1,192.1 and 1,267.8 million pengös respectively.

**Defence.**—Hungary's defence forces are still limited by the Treaty of Trianon to an army of 35,000, all ranks. In 1936 the budgetary effectives numbered 1,817 officers and 33,209 other

HUNGARY: Industrial production index (*The Annalist*)

CHAMPION SKATERS dancing on blue ice in Madison Square Garden, New York, in type of spectacular skating exhibitions that have won popular approval

ranks. There are also 19,000 gendarmerie, 14,000 police, 4,000 customs guards, and 1,600 river guards. Negotiations begun during 1937 for formal recognition of Hungary's right to equality in armaments have not yet been concluded. (See also LITTLE EN-  
TENTE.)

**Hurdling:** see TRACK AND FIELD SPORTS.

**Ice Hockey.** The National Hockey League of powerful American and Canadian professional teams enjoyed a banner season during 1936-37. At the close of the regular season the standing of teams was as follows:

International Group					American Group				
	Won	Lost	Tied	Pts.		Won	Lost	Tied	Pts.
Canadiens (Montreal)	24	18	6	54	Detroit (Red Wings)	25	14	9	59
Maroons (Montreal)	22	17	9	53	Boston (Bruins)	23	18	7	53
Toronto (Maple Leafs)	22	21	5	49	Rangers (New York)	19	20	9	47
Americans (New York)	15	29	4	34	Chicago (Black Hawks)	14	27	7	35

In post-season play-offs the Detroit Red Wings won three of five games to clinch the league title and enter the Stanley Cup final. Montreal Maroons defeated Boston Bruins two out of three for second place, and New York Rangers finished third with two straight victories over Toronto Maple Leafs. In the semi-finals the Rangers beat the Maroons two straight. The final

series for the Stanley Cup, historic emblem of world professional championship, went the full five games, Detroit's Red Wings, holders of the trophy, winning. The 1937 national amateur championship was held at Boston, Mass., March 27 and 28. Four teams competed and the Boston Olympics won the title. Amateur ice hockey received a temporary setback when the teams making up the strong Eastern Amateur Hockey League were disqualified by the A.A.U. executive committee. Outdoors the sport was greatly curtailed owing to the mild winter. (J. B. P.)

**Iceland,** island kingdom of North-west Europe, hereditarily united with Denmark, in the North Atlantic ocean, touching the Arctic Circle. Capital, Reykjavik (seaport; 34,231 in 1935). Ruler, King Christian X (see DENMARK). National flag: red St. George's cross, white-bordered, on blue.

**Area and Population.**—Area: 39,709 sq.mi., divided into 16 provinces; population (1930): 108,861 (density, 2.7 per sq.mi.), predominantly Icelandic and Evangelical Lutheran (State-endowed church; conscience is free). Towns (1935): Akureyri, 4,503; Hafnerfjördur, 3,735; Vestmannaeyjar, 3,510. Education figures (1928-29): 238 (compulsory) elementary schools, 8,709 pupils. Reykjavik has a university.

**History, Trade, and Finance.**—By Charter (1920; amended, 1934) the king's power is exercised by an executive Council (president, Hermann Jónasson, and two others, 1934), being shared, in legislation, with the Althing (not exceeding 49; one-third in Upper, two-thirds in Lower, House), elected by universal adult suffrage and modified proportional representation.

Only one-seventh of the land is productive (0.25 per cent under cultivation). Fishing is important. Leading exports: animals and animal products, fish (cod) and fish oil. Imports (food, fuel, etc.; 1935): 45,469,561 krónur (£2,053,000); exports: 47,771,887 krónur (£2,157,000); Great Britain takes 13%.

Currency unit: króna (exchange: 22.15 krónur=£1). Budget (1937 estimate): 14,858,000 krónur.

There is neither army nor navy, but two fisheries patrol vessels are maintained (and one by Denmark). See also WATER POWER.

BIBLIOGRAPHY.—T. Thorsteinsson, *Iceland, 1936* (Reykjavik). (H. Fw.)

**Ice Skating** offered only limited outdoor recreation in the United States during the winter of 1936-37 because of the scarcity of sustained freezing temperatures. As an indoor spectacle the sport continued to attract huge crowds in metropolitan areas, a four-day charity figure-skating carnival at Madison Square Garden, New York, drawing capacity crowds of 16,000 to each performance. The national amateur speed skating championships were held at Petoskey, Mich., Feb. 6 and 7. Marvin Swanson of Minneapolis won the men's title for the third consecutive year. Miss Madeline Horn of Beaver Dam, Wis., beat the defending champion, Miss Dorothy Franey of St. Paul, to gain the women's title. The indoor championships were held in the Chicago Arena, March 27 and 28. Leo Freisinger won the men's championship by a comfortable margin. Miss Madeline Horn and Mrs. Dorothy Franey Drolson tied for the women's title at 80 points. For the first time in American figure skating the national championships were moved from the Atlantic seaboard. They were held in the Chicago Arena, Feb. 12 and 13. Seventeen-year-old Robin Lee of Minneapolis won the men's championship for the third successive year and Miss Maribel Y. Vinson of Boston won her ninth title in the women's competition. (J. B. P.)

**Idaho,** one of the States of the North-western United States, popularly known as the "Gem State," area, 83,880 sq.mi.; population according to the U.S. census of 1930, 445,032.

estimated July 1, 1937, 1,93,000; capital Boise, 1,544, the largest city of the State. Cities with more than 5,000 are Pocatello, Idaho Falls, Lewiston, Twin Falls, Coeur d'Alene, and Nampa. Of the State's population but 129,507 or 69.1% are urban according to the 1930 census; there are 437,562 whites; 16,638 Indians; 407,108 native whites; and 30,154 foreign-born whites.

BARZILLA WORTH CLARK, governor of Idaho

**History.**—New Democratic officials assumed office in 1937 as result of the 1936 Idaho elections, but Senator Borah was returned to Washington for the sixth time by a substantial majority over Governor Ross, Democrat. President Roosevelt visited the State during September. Leading State officials during 1937 were: Governor, Barzilla W. Clark; Lieutenant Governor, Charles C. Gossett; Secretary of State, Ira H. Masters; Attorney General, J. W. Taylor; Chief Justice, Raymond L. Givens; State Treasurer, Myrtle Enking; State Auditor, H. A. Parsons; State Mining Inspector, Arthur Campbell.

**Education.**—The school population of Idaho was 141,788 during 1936. Of these, 119,270 attended public schools, there being 6,372 pupils and 3,161 teachers in 1,413 elementary schools and 2,898 pupils and 1,334 teachers in 193 high schools. A sum of \$10,043,694 was expended during 1936. Repeal of the State sales tax by referendum in November of that year complicated the problem of financing the schools during 1937. Governor Clark, however, vetoed a plan which would have transferred \$1,500,000 of the general fund to educational purposes.

**Banking and Finance.**—On June 30, 1936, there were 33 national and 22 State banks with a capital of \$5,050,000, deposits of \$82,481,000, and total resources of \$92,742,000. Receipts for the two-year period, 1935 and 1936, were \$48,704,903 and the expenditures \$47,040,178, which with previous balances left \$4,342,728 in the Treasury. The assessed valuation on Aug. 10, 1937 was real and personal property \$270,478,621, public utilities \$105,333,187, total with miscellaneous items \$381,043,757. This marked an increase of \$6,640,323, most of which was due to a rapid increase in mine profits. The tax return for 1937 was estimated at approximately \$1,905,000 of which \$375,000 was to be spent for relief. The 1937 levy was raised from 32¢ to 50¢ due to the abolition of the sales tax which was applied to relief purposes until defeated in the 1936 election by a vote of 75,468 to 68,728. On April 1, 1937, the State's bonded debt was \$1,920,000 as compared with \$2,403,500 a year previously. An issue of bonds valued at \$502,000 in September, however, restored the debt to its former level. The fiscal position will be measurably improved if the State continues to be successful in defending a 1% tax on mine earnings which has been ineffective because of law suits. A Supreme Court and a district decision upheld the tax during 1937.

**Agriculture, Manufactures, Mineral Production.**—Statistics for 1935 reveal that Idaho possessed 45,113 farms valued at \$7,395,329 with an output amounting to \$39,204,000. Because of increased crop values in 1936 rather than because of increased production, the total value of the two leading crops alone almost equalled the 1935 figure, 22,260,000bu. of potatoes bringing \$10,034,000 and 21,096,000bu. of wheat, \$18,142,560. The State also produced 2,448,000 tons of tame hay valued at \$17,381,000.

Recent statistics show that 459 Idaho establishments hired 10,537 wage earners and manufactured products valued at \$67,549,963 during 1935. The leading industries were lumber and lumber products (\$12,118,532), printing and publishing (\$1,924,999), butter (\$1,421,071), and flour (\$831,809).

Idaho's output of gold, silver, copper, lead and zinc was valued at \$27,654,472 in 1936 as compared to \$19,522,704 for 1935. Silver led with 14,537,530oz. worth \$11,259,317. The output and value of the others were: 182,678,000lbs. of lead, \$8,403,188; 98,200,000lbs. of zinc, \$4,910,000; 80,291oz. of gold, \$2,810,199; and 2,954,000lbs. of copper, \$271,768. Idaho led the United States in silver production and ranked second in the output of lead.

(W. E. B.)

**Illinois**, a north central State of the United States, admitted to the Union in 1818, has a population of 7,630,654 (1930 census) of which 1,242,447 are foreign born, 328,972 negro. Estimated population, July 1, 1937, 7,878,000. Area, 56,043 square miles. Capital, Springfield, population 71,864. Four cities in the State are larger: Chicago (3,376,438); Peoria (104,969); Rockford (85,864); E. St. Louis (74,347).

The State officers elected in the general election of Nov. 3, 1936, took office Jan. 11, 1937. Henry Horner, governor; Edward J. Hughes, secretary of State; Edward J. Barrett, auditor of public accounts; and Otto Kerner, attorney-general, were re-elected for a term of four years. John Stelle was elected lieutenant-governor for a four-year term and John C. Martin, treasurer, for a two-year term. All these officers are Democrats. The 60th General Assembly chosen in the same election had a Democratic majority in both House and Senate.

**History.**—Important acts passed by the 60th General Assembly, which sat January to June, 1937, were as follows: An eight-hour law for women workers; a new insurance code; marriage laws requiring a medical examination for both parties applying for a marriage licence, and prescribing a three-day period between the application for and the issuance of the licence. Permanent registration of voters, made applicable in 1935 to ten Illinois cities, was extended throughout Cook County (Chicago). A three per cent tax on public utility sales was passed to replace one that had been declared unconstitutional, and the three per cent Retailers' Occupation Tax (sales tax) was extended to Feb. 15, 1939, after which it reverts to two per cent. The life of the Illinois Emergency Relief Commission was extended to July 1, 1939. Other legislation set up State machinery for the administration of Unemployment Insurance and Old Age Assistance. Total appropriations for the biennium amounted to \$457,997,648.62.

**Education.**—Public instruction in Illinois is supervised by the State Superintendent of Education, elected every four years. John A. Wieland, Democrat, the present official, was elected in 1936. For the fiscal year ending June 30, 1936, the enrolment (elementary and secondary schools) was 1,327,269, with a teaching staff of 47,677. School buildings numbered 13,966. Schools are supported by local taxation and a State distributive fund, and are administered by some 12,000 school boards. At present an effort is under way to promote an equalization of opportunity for school children by enlarging the school unit, increasing State aid and centralizing the whole State system under a State board of education; but laws proposed to this end in the 60th General Assembly failed to pass. The five State normal schools for the training of teachers received a State appropriation of \$5,854,136 for the biennium of 1937-39. The University of Illinois located at Urbana has a 1937-38 enrolment of 13,647 students, including the Colleges of Medicine and Dentistry and the School of Pharmacy in Chicago. Its appropriations for 1937-39 amount to \$14,149,632.

**Charities and Correction.**—Twenty-seven State institutions,

administered by the State Department of Public Welfare, on Aug. 1, 1937, had 49,801 inmates. A new function of the Department is the administration of old age assistance (effective July 1, 1936). Old age pensions were being paid to 120,067 persons over 65 years of age in Sept. 1937, the number representing 28.5% of those 65 and over in the 1930 census. Total grants were \$1,990,950, an average of \$16.58 per recipient. County welfare departments to carry out local administration of the pensions, responsible to the State department, have been formed since July 1937. The administration of unemployment insurance was turned over to the Department of Labor. First payments were due from employers Jan. 1, 1938, as a lump sum settlement on 1937 payments. Thereafter, collections will be made monthly.

Unemployment relief, administered by the Illinois Emergency Relief Commission since Feb. 1932, reached a peak in March, 1935, when grants were made to 1,183,340 persons. In 1936, the average monthly number aided was 738,069, the average monthly cost per family being \$26.11. The number was materially reduced when the Federal Works Progress Administration undertook to give employment to able-bodied workers. On June 26, 1936, 160,062 persons certified from Illinois relief rolls were at work on WPA projects; on Nov. 3, 1937, 104,762 persons were so employed.

Employment on Federal projects and distribution of surplus commodities now comprise the chief Federal contributions to unemployment relief. Funds for direct relief come almost entirely from State and local sources. For the year ending June 30, 1937, such expenditures in Illinois totalled \$54,942,880.06. Of this, \$35,252,534.35 came from State funds and \$19,690,345 from local funds. State relief funds are derived from the Retailers' Occupation Tax.

**Banking and Finance.**—On March 31, 1937, there were 882 banks (573 State and 309 national) with loans of \$958,766,000, investments of \$1,805,915,000, and deposits of \$2,925,140,000. Analysis of the revenues of the State of Illinois for the fiscal year ending June 30, 1937 (total receipts, \$215,137,697) shows the most important source of funds to be the Retailers' Occupation Tax, or sales tax, amounting to \$77,003,381. One-third of this goes to unemployment relief, the remainder to various State expenses, including education and payments on bonds. The utilities tax for emergency relief amounted to \$4,321,629. The motor fuel tax, which yielded \$37,360,061, goes partly to payments on emergency relief bonds, but chiefly to roads. Motor vehicle licence fees, yielding \$20,892,391, with a slightly larger fund from Federal sources, also go to the road fund. The other heaviest revenue sources were liquor taxes and fees (\$10,635,731), corporation tax (\$3,207,268), insurance tax and fees (\$6,386,269), and Illinois Central, in virtue of its land grant (\$1,843,322). No direct property tax has been levied since 1932.

HENRY HORNER, governor of Illinois

**Agriculture.**—Illinois, with 88% of its area in farms (1938 census of agriculture), had an agricultural income in 1936 estimated at \$453,059,000. Even at lower prices, the figures were undoubtedly exceeded in 1937, when Illinois farms produced record crops. The corn yield of 46bu. per acre, an estimated total of 434,746,000bu., is the largest since crop statistics have been kept (1866), and is nearly double the crop of 1936. Production of soybeans was estimated at 21,918,000bu., probably more than 60% of the national crop. Latest livestock statistics are for 1936 and show a slight decrease in number, with the value about as in 1935. The total number of all livestock was then estimated at 8,512,000, valued at \$266,547,000.

**Manufactures, Mineral Production.**—Discovery of new oil fields in the State, which are expected to yield more than the well previously worked, was an outstanding development of 1937. Output for 1936 was 3,831,138bbls. of oil and 502,613,000 cu.ft. of gas, from 11,646 wells in twelve counties. The new fields lie in six counties stretching across the State to the east of St. Louis; in four of these counties no oil had previously been produced. Illinois coal mines, numbering 1,242, and lying in 58 counties, in 1936 produced 51,475,899 tons of coal. The total number of miners was approximately 49,000.

Based on the number of workers employed and amount of pay rolls, figures of the Illinois Department of Labor show a steady gain in industrial activity since 1933. Using the monthly earnings for 1925-27 as 100, statistics for 1933-37 are as follows—employees, 62.7, 71.4, 74.0, 80.0, 91.9; payrolls, 43.1, 52.6, 58.3, 67.0, 84.2. Certain industries such as agricultural implements, glass and glass products, machinery and tools, as well as road building, show a higher figure than for 1925-27. (T. C. PE.)

**Illinois, University of.** The University of Illinois, in 1937, marked the 70th anniversary of its chartering. An act establishing the university was passed by the Illinois State legislature Feb. 28, 1867, taking advantage of provisions of the Federal Morrill land grant college law. As the Illinois Industrial university, the institution opened March 1, 1868, with 50 students and three faculty members. It is located on the boundary of the adjoining cities of Urbana and Champaign in Champaign county, in Central Illinois. In 1870 women were admitted to the institution; in 1885 the name was changed to University of Illinois.

Enrolment has reached an all-time high, making this the fourth largest university in the nation. In the 1936-37 academic year, including extension work and the 1936 summer session, total enrolment was 15,831. The 1937 summer session set a record with 3,481 enrolled. First semester enrolment for 1937-38 topped all past marks with 12,496 resident students on the Urbana campus and 1,151 resident students on the Chicago campus, a semester total of 13,382.

Research was carried on in many fields, including medicine, engineering, chemistry, literature, the social sciences, and agriculture, with 13% of the operating funds devoted to organized research. The University of Illinois library is the largest of any State university, held fifth rank among American university libraries, and has more than 1,200,000 volumes. During the year 34,000 new volumes were added.

Graduate students during the first semester of 1937-38 totalled 1,220, with 107 of these in the colleges of medicine, pharmacy, and dentistry in Chicago, and the other 1,113 in the graduate school at Urbana.

For the 1937-38 academic year, the total university staff numbered 1,803. Of this total, 87 persons were listed as administrative, 1,116 as instructional, 140 as research, 56 as extension, and 80 as library workers. Clerks, technicians, and retired staff members

bers totalled 324. On the Urbana campus also were 104 fellows and scholars, 23 workers in related university organizations, and 146 workers in scientific surveys and State and Federal agencies, making the total number of campus workers 2,076.

No building was begun during the year 1937, but the final unit of the medical and dental colleges laboratories building in Chicago was completed and occupied. Total value of the university's physical plant is \$30,703,991. The State legislature appropriated \$10,154,102 from tax revenues for operation of the university during the 1937-39 biennium. This provides about 63 per cent of the university's income.

**Illiteracy.** During 1937 the nations of the world continued their efforts to reduce illiteracy. This was particularly true of the Soviet Republics, Turkey and the United States. The latest statistics from Russia reveal a decline which has reduced the 75% illiterate in 1895 to less than 30%. Turkey has similarly advanced under the stimulus of Kemal Attatürk's educational program, there being but 55.1% illiterate in 1934 as opposed to 91.8% in 1937. This improvement makes India and Egypt with over 80% illiteracy the most backward countries from which statistics are reported. British efforts to reduce these figures meet difficulties due to the tremendous number of the uneducated. Of European countries, Portugal and Spain present the poorest records, a fact undoubtedly contributing to the high illiteracy in South and Central American countries. An interesting comparison of national illiteracy standings may be gained from the record of foreign-born whites in the United States. In 1930, 9.9% of the foreign-born residents were illiterate with figures as to the nation of origin being reported as follows: Portugal, 34.7; Italy, 25.3; Poland, 19.0; Yugoslavia, 15.6; Turkey, 14.1; Spain, 14.0; Greece, 13.6; Russia, 11.3; Austria, 10.4; French Canadian, 9.9; Hungary, 9.8; Belgium, 6.4; France, 5.8; Germany, 3.2; Netherlands, 3.0; Norway, 2.0; Sweden, 1.5; Ireland, 1.4; Canadian other than French, .6; England, .6; and Scotland, .3. Recent figures to confirm the leading position of Great Britain are not available as reports were discontinued after 1914 when the number of persons unable to sign marriage registers was under 1%.

The United States possessed 4,283,753 illiterates over ten years of age in 1930, or 4.3% of the population of that age. The best record (.6%) was established by whites of foreign or mixed parentage, native whites having 1.8% illiterate, foreign-born whites having 9.9% and negroes having 16.3%. With two-thirds of the illiterate persons of either foreign or negro parentage, the problem was concentrated in the South and in city slums. Of nine geographical sections only the East South Central, the South Atlantic and the West South Central exceeded the U.S. average; while 80% of the illiterate foreigners were urban dwellers. Both of these problems were met during 1937 by the adult education program of the Works Progress Administration. In March, there were 241,048 adults studying in 22,779 classes under 5,785 teachers and officials reported that 700,000 had been removed from illiteracy lists since 1930. The goal for 1940 was a reduction of one million from the 1930 figure, which would place the percentage of illiteracy in the neighbourhood of 2.5%. Up to 1937 this work had cost over twenty million dollars, but the expense was balanced by the resulting decrease in relief rolls and an increased earning power which was estimated at one hundred million.

**Immigration:** see POPULATION, MOVEMENTS OF.

**Imperial Conference.** The Imperial Conference of 1937 was held in London from May 14 to June 15. It was the first Imperial Conference since 1930, barring the Imperial Economic Conference held at Ottawa, Canada, in 1932.

The heads of delegations were: United Kingdom, Mr. Stanley Baldwin, succeeded by Mr. Neville Chamberlain when the latter became prime minister on May 28; Canada, Mr. W. L. Mackenzie King; Australia, Mr. J. A. Lyons; New Zealand, Mr. M. J. Savage; Union of South Africa, General J. B. M. Hertzog; India, the marquess of Zetland. Excepting Lord Zetland, who was secretary of State for India in the United Kingdom cabinet, all the above were prime ministers of their several countries. Southern Rhodesia and Burma were represented by observers, their respective chief delegates being Mr. G. M. Huggins, prime minister, and Dr. Ba Maw, chief minister.

The conference was occupied mainly with questions of foreign policy and defence. Though its publicly announced conclusions on these questions (see *Summary of Proceedings of Imperial Conference*, 1937, Cmd. 5482) were not remarkably novel or clear-cut, the discussions were recognized to have secured a valuable measure of mutual understanding, in the light of the world conditions that had arisen since 1930, particularly general rearmament and the difficulties of the League of Nations. "Emphasis was laid on the importance of developing the practice of communication and consultation between the respective Governments as a help to the co-ordination of policies."

The delegates, while entering into no definite commitments, and while reserving the right of their Governments to uphold their different statements of policy regarding the future of the League of Nations made at Geneva in Sept. 1936, "found themselves in close agreement upon a number of general propositions." These may be summarized as follows. The first objective of each member of the British commonwealth was the preservation of peace. The settlement of international differences should be sought by methods of co-operation, joint inquiry, and conciliation, in which, rather than in recourse to force, lay the surest guarantee for better international relations and the keeping of treaties. The armaments of the commonwealth nations would never be used for aggression or for any purpose inconsistent with the League Covenant or the Pact of Paris. The needed enlargement of the membership of the League would be facilitated by separating the Covenant from the Treaties of Peace. Regional agreements of friendship and collaboration were welcomed in so far as they could be made to contribute to the cause of peace and did not conflict with the League Covenant. An Australian proposal for a regional understanding and pact of non-aggression among the countries of the Pacific was approved in general terms. While the Governments represented wished earnestly for the widest possible measure of disarmament, they held themselves bound to adopt measures of defence essential for their security and for the fulfilment of their international obligations. In order to assist in reviving confidence and increasing economic and financial stability, they declared themselves ready to co-operate with other nations in examining current difficulties, including tariffs and other barriers to world trade and a higher standard of living. Finally, while themselves firmly attached to the principles of democracy, they held that differences of political creed should be no obstacle to friendly relations between governments and countries, and that nothing would be more damaging to hopes of peace than the division of the world into opposing groups.

The statement was interpreted as opposing a rigid interpretation of the sanctions aspect of the League's function; and as favouring an attempt at a settlement with Germany and other Powers.

The discussions on defence, as publicly revealed, consisted mainly of an exposition of national policies. Stress was laid on the advantages of co-operation in the supply of munitions and raw materials, as well as of food and feeding-stuffs, to the different countries of the commonwealth, and it was agreed that technical discussions on these lines should continue, subject to governmental freedom on issues of policy. The several Governments, it was noted, were aiming to create and maintain an adequate chain of air bases and re-fuelling stations along the lines of communication between the different parts of the empire. Other means of co-operation that were noted included the interchange of naval, military, and air force officers, and the education of officers at the Imperial Defence college in London. The conference was not called upon to consider detailed economic issues.

The further work of the conference included a review of colonial affairs, the acceptance of a report from the Imperial War Graves commission, the adoption of resolutions on the promotion of civil aviation and on relations with foreign air services, and the consideration of the future of the Imperial Shipping committee and other shipping questions, the future of the Imperial Economic committee, and co-operation in polar research. (H. V. H.)

**Imports:** see EXPORTS AND IMPORTS.

**Income Tax.** Recent income tax development in the United States has been in the direction of: (1) increasing the rôle of the tax; (2) modifying the basis for the corporation income tax; and (3) enhancing the effectiveness of income tax administration.

Federal income tax collections in the fiscal year ended June 30, 1937, amounted to \$2,149,000,000 or 41.8% of the total Federal internal revenue and customs. Individual and corporate income taxes shared approximately equally in this total. In other years, the collections from corporations generally exceeded those from individuals. State collections from these sources for the fiscal year 1937 are estimated to have amounted to nearly \$300,000,000 or approximately 10% of State receipts.

**Tax on Individuals.**—The Federal Government's individual income tax consists of a 4% normal tax and a surtax ranging from 4 to 75% applicable to incomes over \$4,000 after allowance for exemptions and credits. The personal exemptions allowed for both normal and surtax purposes are at present \$1,000 for a single person, \$2,500 for married persons and \$400 for dependents. The earned income credit, applicable against the normal tax, is at a rate of 10%, allowable only on amounts of earned income not in excess of \$14,000, with \$3,000 of income considered earned whether or not actually earned. These provisions serve to exempt single individuals with net incomes of \$1,111 or less and married persons of \$2,778 or less, if without dependents, and restrict income tax liability to comparatively few individuals—2,110,890 in 1935.

Income tax data for 1935 show that nearly 60% of the total net income reported by individuals was received by persons having less than \$5,000 net income each, and 92.6%, by persons having less than \$50,000 net income. On the other hand, due to the operation of the exemptions and the progressive surtax rates, persons with less than \$5,000 net income paid 6.1% of the total individual income taxes collected, and persons with less than \$50,000 net income, 45.6%.

A general income tax upon individuals is levied by 29 States. Five additional States tax particular sources of income. In all but one of the aforementioned 29 States, the rates are progressive, ranging from a minimum of 1 to 3% to a maximum of 3 to 15%. In addition, 5 of these States impose surtaxes at various rates. The maximum State income tax rate, including both normal and

surtax, is 29%. On the whole, State income taxation is directed toward the low income groups, as is evidenced by the fact that the exemptions are below the Federal level in 12 out of 29 States in the case of single persons, in 19 States for married persons and in 21 States for dependents. Although some of the States preceded the Federal Government in employing the income tax, more than half the States now imposing it adopted it in 1929 and following years.

**Tax on Corporations.**—Federal corporate income tax rates are graduated from 8 to 15%, the top rate applying to the portion of income in excess of \$40,000. At the close of 1937 general corporation income taxes were also levied by 32 States, the rates usually ranging between 2 and 6%. Six of these States, like the Federal Government, imposed graduated rates—the other 26, flat rates.

In the past few years the basis of corporate income taxation by the Federal Government has been undergoing a process of modification. Until 1936, ordinary dividends distributed by domestic corporations were exempt from normal individual income tax (though not from surtax), indicating that in part at least the corporation income tax was regarded as a personal income tax at source. In 1936, however, dividends were made subject to the normal individual income tax, as well as to the surtax. In addition, Federal corporation income tax rates were graduated for the first time. Further, dividends received by corporations were made taxable to the extent of 15%. These innovations may indicate that the normal corporation income tax is now viewed by the Congress as essentially a corporate privilege tax rather than as an integral part of the personal income tax.

The States appear to have been in the forefront of the development towards the conception of the corporation income tax as a privilege tax. They were first in adopting graduated rates and developing and continuing the practice of taxing dividends under their individual income taxes. At present 19 States, including New York and California, tend to divest the corporation income tax of personal elements by subjecting dividends to individual income tax rates even though distributed by corporations subject to their own corporation income taxes.

In addition to the corporation normal income tax, the Federal Government in 1936 enacted a surtax on the undistributed profits of corporations, with rates graduated from 7 to 27% and dependent upon the degree of distribution of the profits. Under the in-

NUMBER OF INDIVIDUAL NET INCOMES of \$1,000,000 or more in the United States 1926-1937

individual income tax law in the United States the profits of corporations are taxable to shareholders only as they may be distributed and received in the form of dividends, whereas the profits of proprietorships and partnerships are taxable to the individual owners irrespective of distribution. The main objectives of the new undistributed profits tax were to provide needed revenue, and to make the individual income tax apply more uniformly as between corporate equity owners with interests in undistributed profits and those directly participating in businesses organized as proprietorships or partnerships.

From the inception of the income tax in the United States, efforts have been made to safeguard against tax avoidance through the use of corporations. From 1913 to 1920, the undistributed profits of corporations formed or availed of to prevent imposition of personal surtaxes were made taxable to the shareholders. In the Revenue Act of 1921 and later acts, this provision was replaced by a special tax upon such corporations. In 1934 these provisions were supplemented by surtaxes on personal holding or "private" companies as therein specifically defined. In 1937 the rates on such companies were increased to 65% on the first \$2,000 and 75% on the balance of undistributed income, and the provisions relating to such corporations were generally overhauled to minimize the avoidance of the individual surtax rates through this device. This was done through the disallowance of deductions attributable to such items as "incorporated yachts," "incorporated personal talents," and artificially created losses, interest charges, or business expenses. Further, the road to tax avoidance through the organization of foreign personal holding companies was blocked by requiring individuals to report for income tax purposes their pro rata shares in the profits of such companies irrespective of whether distributed or not.

In order to make more effective the administration of the income tax applicable to non-resident aliens and non-resident corporations and to equalize taxation between them and residents of the United States, the provisions pertaining to the taxation of non-residents were revised in 1936 and again in 1937. These revisions replaced the regular normal tax and surtax on income from sources within the United States, in the case of individuals, with a flat withholding rate of 10% on specified sources of fixed income (5% under treaty with Canada) where the income of the non-resident was \$21,600 (the point at which the effective rate for citizens and residents is 10%) or less; non-resident alien individuals with net incomes in excess of \$21,600 are taxable on their fixed sources of income at the normal tax and surtax rates applicable to citizens and residents. In the case of foreign corporations having no office or place of business here, a flat withholding rate of 15% on specified sources of fixed income (10% on dividends, except Canada, 5%) is applied. (See also EXCESS PROFITS TAX.)

(R. ML.)

**Great Britain.**—Taxes on income were first imposed in Great Britain in 1799, but abrogated between 1815 and 1842, since when such a tax has been continuously in force. Immediately before the World War, the standard rate was 1s. 2d. in the pound, but since 1918 it has never fallen below 4s. (1925-30), and in 1918-22 stood at its highest figure of 6s. in the pound. The 1938 standard rate, fixed by Budget of 1937, is 5s. in the pound.

Taxation is assessed on "assessable income," which is the actual amount of income, less one-fifth of the amount of "earned" income up to a maximum deduction of £300 for one person. Persons of 65 and upwards whose total income does not exceed £500 may likewise deduct one-fifth of their "unearned" income for assessment purposes. Those whose total income does not exceed £25 are wholly exempt from the tax.

Deductions from the assessable income are allowed as follows in order to ascertain the "taxable income": (1) A personal allow-

ance of £100, or if the taxpayer's wife is living with him, £180. (2) Four-fifths of the amount of any income earned by the wife, such additional allowance being limited to £45. (3) An allowance of £60 for each child (including step-children and adopted children) under 16, or over that age if receiving full-time educational instruction, provided the child has not in its own right an income exceeding £60 per annum. (4) An allowance of £50 to a widower or widow who has living with him or her a female relative (or under certain conditions a non-related female) as housekeeper or as guardian of children. (5) A similar allowance to an unmarried person who has living with him his mother or other female relative in charge of his brothers or sisters being children. (6) In certain circumstances, an allowance of £25 in respect of an infirm or incapacitated relative, a widowed mother-in-law, or a daughter who attends on the taxpayer.

The taxable income, thus arrived at, is chargeable at one-third of the standard rate of tax (*i.e.*, at present at 1s. 8d. in the pound) in respect of the first £135, the whole of the remainder being taxable at the full standard rate. Certain deductions are allowed in respect of life assurance premiums.

In addition to the income tax thus payable, surtax is charged on incomes exceeding £2,000. Surtax is payable on Jan. 1 of the year following the income tax year (which latter extends from April 6 to April 5). The surtax rates for the year 1936-37 (payable in 1938) are as follows:

For the first	£500 in excess of £2,000	1s. in the pound.
For the next	£500	1s. 3d. "
For the next	£1,000	2s. "
For the next	£1,000	3s. "
For the next	£1,000	3s. 6d. "
For the next	£2,000	4s. "
For the next	£2,000	5s. "
For the next	£5,000	5s. 6d. "
For the next	£5,000	6s. "
For the next	£10,000	6s. 6d. "
For the next	£20,000	7s. "
For the remainder		7s. 6d. "

Generally speaking, taxpayers who reside outside the United Kingdom can claim no reliefs or exemptions, unless they are British subjects, present or past servants of the Crown, or their widows, persons residing abroad for reasons of health, or those living in the Isle of Man or the Channel Islands; but relief is given in respect of income which is subject to income tax both in the United Kingdom and in a British Dominion.

Tax on earned incomes is payable half-yearly, on Jan. 1 and July 1; tax on unearned incomes is payable in one instalment on Jan. 1, as is tax payable by companies, which are not granted an allowance for earned income. Weekly wage-earners, other than clerks, typists, and similar employees, are assessed half-yearly and pay half-yearly.

The income of a wife living with her husband is considered for tax purposes as a part of his own; but children are separately assessable. Certain forms of income, including war pensions, scholarship income, interest on National Savings certificates, gifts (other than voluntary pensions), and profits from the sale of capital assets, are exempt from liability to tax.

The 1937 Finance Act provides that any amount payable as "National Defence Contribution" is allowable as a deduction from income for purposes of income tax.

In the case of investment income, tax is usually deducted at the source, and if the tax so deducted exceeds the taxpayer's total liability, he may recover the excess tax so paid. Claims for adjustment of tax may also be made in the event of business losses.

The receipts from income tax and surtax in 1936-37 were £257,237,000 and £53,540,000 respectively.

For 1937-38 they are estimated at £288,150,000 and £58,000,000 respectively.

**Independent Labour Party.** The I.L.P.'s membership increased somewhat during 1937 in Great Britain, and the party has now some 12,000 members and over 350 branches, principally in the west of Scotland, Lancashire, Yorkshire, and South Wales. Its political influence is considerably greater than is reflected by its numbers, for its four M.P.'s—Messrs. Maxton, Buchanan, McGovern, and Stephen, all from Glasgow—affect the debates in the House of Commons, and conditions in the trade unions and throughout the country. (L. H. D.)

**India,** a sub-continent projecting from the mainland of Asia, lies between the 8th and the 37th degrees of North latitude. It comprises 11 major or "autonomous" provinces, 5 minor areas directly administered by the central British Government, and a large number (between 500 and 600) of States under Indian rulers. The latter are scattered about the sub-continent, and vary greatly in size and importance, as well as in the powers enjoyed by their chiefs. British India (the 16 major provinces and minor areas) has its capital at Delhi, and is under a viceroy and governor-general (the Marquess of Linlithgow since April 1936), who is also the representative of the Crown in its relations with the States.

**Area and Population.**—The total area of India (from which Burma has now been separated) is 1,575,187 sq.mi., and its population (1931 census) 338,170,632. Males exceeded females by over 10,000,000. There are 862,679 sq.mi. and 256,859,787 souls in British India, and, in the States, 712,508 sq.mi. and 81,310,845 souls—a striking divergence in the density of population. Between the census of 1921 and that of 1931, the population had grown by nearly 32½ millions or 10.6%; the birth-rate of recent years being in the neighbourhood of 34 per thousand, and the death-rate about 23.

**History.**—In 1937, a new page was opened in the history of India. The constitution which, enacted by the British Parliament in 1935, came into operation in April 1937, is in some respects admittedly transitional; but it gave self-government to the peoples of India, and self-government is what they had never enjoyed before.

Its outstanding features are fourfold: (1) For the central Government of India a federation is to be established, comprising the provinces and those States which accede to the arrangement. There will be a federal legislature of two chambers; and from it will be drawn ministers to form the governor-general's cabinet and to conduct the Government of all-India in respect of federal subjects. (2) Each of the major provinces has an elected legislature (in six cases bi-cameral, in the others not), from which ministers are drawn who form the governor's cabinet and conduct the Government of the province in respect of provincial matters. The fields of all-India and of provincial administration are defined by the Act, and the powers which the rulers of States do not agree to transfer to the federation will be reserved to them in their Instruments of Accession. (3) Notwithstanding the above, the defence of India, its ecclesiastical affairs, and its external affairs except its relations with other parts of the British Empire, are retained in the hands of the governor-general and are not subject to either the federal or the provincial administrations. (4) There are certain "safeguards," or emergency powers, enabling in effect the governor-general and the governors, in their respective spheres, to overrule their ministers when urgently necessary in the interests of public order or good government.

Agitation for political rights had long outrun constitutional advance; and the Act of 1935, although it probably gave the Indian politician more than he had ever expected, was stigmatized by the Congress (advanced Nationalist) party as unacceptable

and an insult to Indian aspirations: a minority of the party contending that nothing would satisfy them except the complete severance of the British connection with India. When the general elections, however, were held for the new legislatures in January and February of 1937, the Congress threw its whole weight into the contest, with the result that its superior organization and political vitality secured a remarkable triumph, and its adherents obtained a majority of the seats in six out of the eleven provinces. There was no obligation to summon the new legislatures before Oct. 1; so the governors had time to form their cabinets, a task of some delicacy in the provinces dominated by the Congress. Minority Governments were got together in these six provinces, the Congressmen refusing to take office except on terms which would have been incompatible with the Act. Eventually, in some measure under Mr. Gandhi's influence, the Congress weakened and the governors were able to man their cabinets, in every province. The new Governments were thus in full working order everywhere before the year ended; and there were indications that the sense of ministerial responsibility and of patriotism was on the way to modify the fiery creed of non-co-operation.

The establishment of the new central Government did not fare so well. In the mood of exaltation which characterized that gathering, the Princes who attended the first Round Table Conference had acclaimed the idea of a federation. As practical details emerged, the romantic vision of a united India began to fade; and the limitations on the old autocratic powers of the Princes, which would be entailed by membership of a federal super-State, came into unwelcome prominence. At the same time, the Congress opened an attack on the principle: they would have no partnership with effete systems of personal rule: they would agree to a federation of democratic provinces, but to nothing more until the States had been granted popular Government. In these circumstances, the federation clauses of the new constitution have not yet become operative. They require the voluntary adhesion of the rulers of at least half the total population of the States; and there is no immediate prospect of this being secured. Meanwhile, the central Government is in the anomalous position of working on the old lines of an irremovable executive yoked to an irresponsible legislature. An important step, however, was taken in the inauguration (Dec. 1937) of a Federal Court, with an eminent British jurist, Sir Maurice Gwyer, as its first Chief Justice. The court has original jurisdiction in disputes between members of the federation or between the federation and any of its units. It has also appellate jurisdiction from any Indian high court, upon certificate from the court concerned in cases involving a substantial question of law as to the interpretation of the Constitution. It is probable that ultimately a much wider appellate power will be conferred on the court.

By the end of 1937, Indian ministers had hardly been long enough in the saddle to develop their administrative programs in detail; but several interesting measures had been taken in pursuance of the social reform which was promised in the election manifesto of Congress candidates. Two of those steps have already led to trouble, in the agricultural field and the labour field. The agrarian policy in most provinces aims at the reduction of tenants' rents and their protection from ejectment: in provinces where the landlord system prevails, this has seriously unsettled the agricultural population, while it threatens everywhere to undermine provincial finance, which owes much of its stability to the land revenue. Similarly, the Congress policy of improving the conditions of industrial labour has borne some of its first fruit in widespread strikes and labour unrest. The mills at Cawnpore suffered, in spite of efforts of the Congress ministry to reason with the strikers. In Calcutta also a strike movement was active. A less controversial plank in the Congress platform is prohibition;

and the Madras Government has introduced it experimentally in one district. Here also the financial reaction will be considerable, as the excise revenue is no unimportant feature in provincial budgets.

The Government has taken control of broadcasting, and has organized an all-India radio, intended to supply services in the chief vernaculars for the whole country; but at present only one inhabitant in 7,000 has a wireless licence. A short-wave relaying service for foreign transmission is being installed at Delhi. The film industry is making rapid advance, but is handicapped by shortage of capital. There are over 100 production companies, but only 700 cinemas in the whole country.

In external politics there was nothing eventful during the year. Indian sentiment was gratified by the election of H.H. the Aga Khan to preside over the League of Nations Assembly in Sept. 1937. The central legislature repudiated the Ottawa agreements so far as they affected India, and negotiations for a trade pact to replace them were in hand at the end of the year. The action of Japan in China is being watched with some apprehension. It has for the moment allayed the outcry of the extremists against the British army in India as an extravagant agency for work which could equally well be done by an Indian militia.

**Communications.**—The route mileage of open lines in India as a whole was over 43,000 mi., close on 39,000 of which belong to the State, though the agency and conditions of working vary largely. Roughly half the mileage is on the broad or 5½ ft. gauge, and the greater part of the other half on the metre gauge. The capital at charge was about £665 millions, and the return from State-owned lines in 1936–37 was as follows in £ millions: Gross traffic receipts, £71½; net receipts, £24.0; interest charges, £23.1; surplus, £0.9. For six years up to March 1936, there had been successive deficits in the railway revenues, aggregating 31½ crores (£23½ millions). The failure of the railways to render the assistance which had been expected from them to general revenues led to an exhaustive enquiry into the whole system by Sir Ralph Wedgwood, an eminent authority on British railways: his report was published in June 1937, but the decisions of the government upon it have not yet been completed. The competition of road traffic is beginning to cause similar difficulties to those experienced in other countries; but that motor transport is still in its infancy is evident from the following statistics, and from the fact that 1935 was the first year for which such figures were collected: cars (including taxis), 109,565; cycles, 12,411; buses, trucks, etc., 9,836.

**Agriculture and Minerals.**—Agriculture naturally has pride of place in India's economic structure. The world depression hit the Indian peasant very hard, and recovery, though it had started, was only partial in 1937. The slump, however, made no material change in the regular routine of seed-time and harvest: wheat, for example, though its export fell to about one-tenth of its former magnitude, continued to be the staple crop of northern India, covering an acreage of from 25 to 28 millions. Rice, however, with its wider range, and the tall millets which are grown for local consumption, occupy about 80 million and 40 million acres respectively. Oilseeds account for about 18 million acres, and cotton for 14 to 16 millions. The area under jute has declined with the serious set-back experienced by the industry, and operations in the tea gardens have been curtailed by the agreement with Ceylon and Java for the regulation of output. The export of these two commodities in 1936–37 was of the value of £32 millions (two-thirds manufactured and one-third raw), and £15 millions respectively. Sugar, on the other hand, has become an active industry, under a protective tariff, and the acreage of cane is now in the neighbourhood of 3½ millions, the output having doubled in the last 12 years. The total cultivated area in British India is 230 mil-

lion acres, about 15% of which carries more than one crop in the year.

Of the other natural resources of India, forest produce is prominent, as 12% of the area in the British provinces (excluding Burma) is under forests. Coal comes second, with an output in 1935 (the last year for which full figures are available) of 23,000,000 tons. Gold was mined to the extent of 326,000 fine ounces; but it is worked mainly in the State of Mysore. Nearly 6,000,000 fine ounces of silver were produced, and close on 2,000,000 tons of salt (Aden, however, contributing to this last figure). Iron ore showed an output of about 2½ million tons, and manganese of 640,000 tons. Bauxite, tungsten, and monazite are growing in importance; and there is an old-established petroleum business in Assam, with newer developments on the N.W. frontier.

Eight years ago the sea-borne trade of India was valued at £485,000,000: in 1936–37 it had shrunk to £282,000,000. But improvement was creeping in, and a favourable balance of trade was being restored on healthy lines. When the outside world found itself unable to buy from India the agricultural produce which used to be its staple export, India had to turn to other means of meeting its import bills; and the consequence was a prolonged drain upon the precious metals of which India has for ages been proverbially the sink. Twelve years ago the net imports of treasure (chiefly gold) was in the neighbourhood of £70,000,000. When bad times came, this position was completely reversed, and there was five years ago, a net export of £50,000,000 of treasure. Last year the net outflow had fallen to just over £11,000,000. During the slump, it has been estimated that India must have parted with at least £200,000,000 worth of its hoarded gold.

The balance of payments in 1936–37 for India's obligations abroad will be apparent from the following analysis of the sea-borne trade (figures in £1,000,000): imports: merchandise 95,793, treasure 11,614; exports: merchandise 151,922, treasure 22,305; excess of exports, 66,820. Great Britain provided 38% of the imports and took 31% of the exports: the corresponding figures for the U.S. were 6½% and 9½% respectively.

Apart from the general response to world conditions which helped the upward movement of industry in 1937, the rearmament of Europe was not without some indirect effect, especially on the prices of iron and steel. A more direct fillip, however, was provided by Japan: she was too busy with her military enterprise in China to pour the usual flood of cotton goods into India, and the Bombay mill-owners have enjoyed an unusual run of prosperity.

**Banking and Finance.**—The unit of currency, the rupee, is a silver coin of 180 grains troy, eleven-twelfths fine, and linked to sterling at a parity of 1s. 6d. There is a variety of fractional coinage, the rupee being divided into 16 annas, and the anna into 4 pice or 12 pies. A lakh of rupees is 100,000 (£7,500), and 100 lakhs make a crore (£750,000). Currency notes from one rupee to 10,000 rupees in denomination circulate to the number of about 120,000,000. Throughout 1937, the trade balance kept the rupee steadily above its sterling parity.

The public debt of the central Government is distributed between India (539.8 crores) and England (£276,000,000). The provincial governments have now their own borrowing powers, though only Bombay, the United Provinces, and Punjab have so far come on the market. An indication of the strength of India's financial credit is afforded by its latest rupee loan in May 1936, when 12 crores, redeemable in 1948–52, were raised at par on an interest basis of 2½%.

The budget estimates for 1937–38 gave the following totals (£000)—revenue: central 89,564; provincial 62,935; total 152,499. Expenditure: central 89,510; provincial 62,821; total 152,331. There are two topics of perennial controversy between the

central and the provincial governments: the obligation of the former to assist deficit provinces, and the allocation of the proceeds of taxation on incomes. An award on both points has been issued by Sir Otto Niemeyer, a British treasury expert, and is still under discussion. Customs continues to be the mainstay of the central revenues: the tariff varies widely round a general standard of 25% *ad valorem*, rising to 50% and over for certain luxury articles (cars, cigars, wireless sets, confectionery, plate, etc.), and becoming severely protective for sugar, matches, silk and cotton fabrics, iron and steel. For sugar, the protection is so effective that an excise duty has been imposed on its local manufacture as some contribution to the loss of revenue on its import.

The banking system is being rapidly transformed from the old indigenous lines to modern methods. In 1934 (later figures are not available) there were 34 Indian joint stock banks, each with capital and reserve of over 5 lakhs (£37,500), and a large number of smaller concerns. Besides these there were 33 co-operative banks, the 18 exchange banks which have their head offices outside India, and the Imperial bank of India at the top of the tree. The new Reserve bank is now fully established and has taken over the whole of its currency and other functions.

**Religion and Language.**—In the matter of religion, Hinduism claims 239,000,000 and Islam 77,000,000: there are roughly 7½ millions of Animists, 6,000,000 Christians, and 4½ million Sikhs; the Parsees, though important in business, being a small community of barely over 100,000. India is sometimes described as a land of 200 languages; but the statement is misleading, as many of the diverse tongues are merely tribal dialects spoken on the Assam and Burma frontiers. Of the others, however, 23 are important enough to be spoken each by over 100,000 people; and there are at least a dozen distinct alphabets. The largest linguistic group is formed by variants of Hindi, spoken by 108,000,000; and Bengali comes next with 53,000,000. Urdu (or Hindustani) is an admixture of Persian and Hindi origin widely spoken, and understood more widely, over northern India, besides being a useful *lingua franca* in other parts of the country. The statistics of literacy are not too trustworthy; but at the 1931 census 1 male in every 7 and 1 female in every 56 were returned as literate in their own vernacular; while 1 man in 42 and 1 woman in 430 were acquainted with English.

Calcutta, the capital of India until Delhi was given that dignity in 1911, is the most populous city (pop. 1,485,582 in 1931) and the second largest in the British Empire. Next in importance come the two old Presidency towns, Bombay (1,161,383) and Madras (647,230). There are 10 other cities with a population of over a quarter of a million each, and 26 others with between 100,000 and 250,000 inhabitants. This sufficiently indicates how small a fraction of the total is the urban population.

**Defence.**—The regular army in India comprises about 60,000 British and 140,000 Indian troops. There is also an auxiliary force (European) of about 24,000; and the Indian Territorials are about 18,000 strong. Finally, the Indian Army Reserve can call on about 35,000 men. Forces maintained by the Indian States number some 45,000 in all, and can in emergency be put under the orders of the Government of India. There are now 8 squadrons of the Royal Air Force stationed in India, with one bomber transport flight. An Indian air force was constituted in 1932. The old Royal Indian marine was formed into a Royal Indian navy in 1934, and is now a purely combatant naval service, consisting of a depot ship, 5 sloops, and 3 minor craft, commanded by a vice-admiral of the Royal navy. (ME.)

**Indiana,** a north central State of the United States, popularly known as the "Hoosier State." Population (estimated July 1, 1937), 3,474,000 (3,238,503 in 1930). The death

rate for the year 1937 was 11.7 per 1,000, a decrease of .5 from 1936, and the birth rate was 16, an increase of .5 (State Board of Health). The majority of the population had become urban (55.5% in 1930). The largest cities (with their 1930 population) are: Indianapolis, the capital, 364,611; Fort Wayne, 114,946; South Bend, 104,193; Evansville, 102,249; Gary, 100,426. Indiana is one of the most "American" of States; 96.2% of its population in 1930 were white, and of the whites 92% were natives. The centre of

M. C. TOWNSEND, governor of Indiana

population of the United States has been located in it for more than 40 years; it is now near Linton, Greene county.

**History.**—Under an important decision of the State Supreme Court in 1935, reversing former practice, amendments to the constitution receiving a majority of the votes cast upon them (regardless of the number voting for candidates in the election) become part of the constitution. In Nov. 1936 an amendment was ratified permitting negroes to serve in the militia.

Since 1933 the Democratic Party has controlled the legislative, executive and judicial branches of the State Government. The administration of Paul V. McNutt (Jan. 1933—Jan. 1937) concentrated all appointive power directly in the governor as political patronage, grouped the many State offices and institutions into eight departments, levied a tax on gross income and from it gave State aid to public schools, repealed State prohibition and developed a system of licensing the manufacture, importation and sale of intoxicants designed to prevent the return of the saloon. In 1937, under Governor M. Clifford Townsend, the State Department of Public Welfare and county departments of public welfare were created, the personnel of both being selected by the merit system. The State distribution to public school teachers, also, was increased to \$700 annually for each teaching unit.

By the co-operation of the Federal Government old-age pensions are now granted, unemployment compensation has been provided for (payments begin in 1938), and other measures of public welfare and social security have been effected. A Federal homestead settlement at Decatur, and a Federal housing project for coloured people in Indianapolis were completed in 1937.

The State Constitution prohibits the contraction of any State debt except in three cases; the State on June 30, 1937, had an accumulated balance of \$47,544,763; the total true receipts for the fiscal year ending then were \$114,653,348, the total true disbursements \$104,785,384. Receipts from the gross income tax have increased steadily from \$10,388,014 reported in 1934, to \$20,556,656 in 1937.

**Education.**—The consolidation of small schools into larger units continues with a reduction of 243 in 1937. The requirement of a four-year college course for teachers' licences in elementary schools has been adopted, effective in 1940. Perhaps the most notable step in cultural progress during the year was the development of the Indiana Symphony Orchestra, Indianapolis, into a first-class organization with Fabien Sevitzky as conductor.

**Agriculture and Manufacture.**—The economic development of Indiana is diversified, the two leading occupations being, in order, manufacture and agriculture. The depression, though

very serious, was not as severe there as in many other States. The Calumet region, along Lake Michigan, with its steel mills, rolling mills, iron and steel blast-furnaces, and petroleum refineries ranks first as an industrial area, followed, with extremely diversified manufactures, by Indianapolis, Fort Wayne and South Bend. Corn was the largest crop in 1937, as usual; but practically all of the farm products of the middle temperate zone are being produced in quantity; the cultivation of soy beans is increasing; the so-called muck farms and gardens of Northern Indiana are proving extremely productive.

Approximately 7,000 mi. of steam railroad continue in operation. Electrical railroads, formerly very extensive, have, for the most part, been abandoned or are operated by receivers. The State highway system (9,168 mi. in June 1937, of which 4,860 are of high surface type) and the great extent of surfaced county roads (the largest mileage of any State) bear an increasing part of the traffic—in 1936 there were licensed 736,073 passenger automobiles, 122,215 trucks, and 962 buses. The State is now crossed by five transcontinental air lines, three serving Indianapolis, which has an important municipal airport.

Labour troubles were frequent in the earlier part of 1937. The most serious strikes, in the steel industry in Lake county, were settled by both sides reaching agreements with Governor Townsend as intermediary, a plan which attracted national attention. At the end of 1937 the Indiana Federation of Labor claimed 202 local unions with 25,000 members, and the Committee on Industrial Organization a still larger number.

The Ohio river flood of Jan. 1937 inflicted great suffering and loss upon most of the Indiana cities on the river, the greatest upon Jeffersonville. The town of Leavenworth (about 600 population) was abandoned for a better location; other cities repaired the damage. (C. B. C.)

**Indians, American.** Fundamental changes in the relationship of the American Indian to the Federal Government have taken place during the five years between 1932 and 1937. Not all Indian tribes have experienced the changes equally. The Indian Reorganization Act of June 18, 1934 has been the organic structure within which many of these modifications have become possible.

All Indian tribes were self-governing when they first experienced white contact. They lost many of these rights under wardship status. The new Federal statute offers the Indians of today the opportunity to revive or continue their tribal type of organization as a governmental unit under law. The law is optional, not mandatory, and each tribe was required to accept or reject by a secret ballot vote of the Act before June 18, 1936. Of equal importance with the self-government features of the law are credit provisions, which enable chartered tribes to secure Federal funds for use by the tribal corporation or reloan to individual Indians.

The fifty-year-old policy of allotting Indian lands to individuals and allowing those individuals to sell their holdings is reversed. About twenty-two million acres of the best Indian lands were lost through alienation. The new law forbids the sale of Indian tribal lands, and individual Indian lands may only be sold in extreme emergency. New lands are being bought, and an effort is being made to acquire for tribal use the Indian lands which through inheritance have become useless to any individual.

On the 130 recognized Federal jurisdictions within the continental United States, 189 groups have already availed themselves of the new law and are in various stages of organization. Twenty-seven groups have rejected the Act. In 1937, Congress appropriated \$4,000,000 of the \$12,000,000 credit money authorized by the Act for loan to organized tribes.

Recognition of the ravages of erosion on overgrazed Indian lands has led, during the same period of time, to active cooperation of the Federal Soil Conservation Service with the Indian office in putting into effect, with Indian assistance, better practices of range management and erosion control. This work has been most significant among the tribes of Arizona and New Mexico.

A gradual reorientation of the Indian school program has greatly increased the number of children in Federal day schools or public schools near their homes and has reduced both the number of boarding schools and the number of children enrolled on a boarding basis. Enrollment in secondary vocational schools has more than doubled during this period, and a great deal of emphasis has been placed upon equipping Indian children with skills which will enable them to make a living through exploitation of the natural resources reserved to Indians. (W. W. B.)

**Indo-China, French:** see FRENCH INDO-CHINA.

**Industrial Research.** Self-sufficiency in their industries is the research aim of many countries. Nevertheless in a few fields—tin and silver are examples—national frontiers are ignored in industrial research. The researchful rayon industry has had phenomenal success, and the annual world production is now sufficient to make one full-length garment, using three yards of material, for every person on earth. Permanent water-repellents and crush-proof processes for textile fabrics received much attention in 1937. Novel synthetics brought a new era to solvents, paints, plastics, and perfumes. Research on problems of industrial hygiene went forward and laboratories devoted to this work were established by many organizations. Air-conditioning investigations included mechanisms of evaporation of water, drying, and equipment. Designs were prepared for underground bombproof power plants for Europe's chemical industries.

Let us make a hasty inspection trip to the leading nations, visiting them in alphabetical order, to glance at the industrial research under way and to learn about some of the outstanding results in each country.

Manufactures of Canada, embracing power and transportation, petroleum, Trail industries (both metals and heavy chemicals), precious metal recovery, radium, aluminium, cobalt, selenium and tellurium, pulp and paper, sodium and phosphorus compounds, acetylene generation and synthetic products from acetylene, refractories and cement, and textiles, are carrying on extensive scientific research. Since Canada has become an important producer and world supplier of radium, the international price has declined about 50%. The National Research Council of Canada is demonstrating the high value of basic scientific investigation in national welfare; its accomplishments constitute a source of pride to the Dominion. During 1937 some seventy original contributions on physical and chemical topics were published in the *Canadian Journal of Research*. Various Canadian universities are busily engaged on sundry agricultural problems.

In Czechoslovakia, the Coal Research Institute in Prague studied the reactivity of coke and the Glass Research Institute at Hradec Kralove the standardization of lead glass. Athermal glass (to secure "cold light" in buildings) was developed at Billin, and, like the United States, Czechoslovakia took up seriously the production of glass fibres. Synthetic resins, pharmaceuticals, lacquers, explosives, and rayon strengthened their positions through research. Investigations on synthetic rubber were especially active.

Industrial research in France related mainly to dyestuffs, heavy chemicals, naval stores, essential oils, perfumery and toilet prep-

arations, fertilizers, and wines. Synthesis as connected with gasoline, coke-oven gas, and coal distillation made considerable advance. Through other research, progress was accomplished in producing the vat series of fast colours and many dyewares were introduced for acetate rayon. France is enlarging her cellulose industry and during the year commercialized the Sindl process of making uniform cellulose triacetate.

As for Germany, all industrial research positions under the German Ministry of Education are unified; the Reich Research Council, which plans all investigations, now has jurisdiction over about 1,000 research organizations. Plastics, rubber, textiles, fats, cellulose, and metals are getting main attention. German research was especially active during 1937 in the fields of alloys, synthetic resins and rubber, tanning materials, and art goods. Calcium chloride and sodium silicate were tried for reinforcing shifting sands and other loose formations under building foundations. German engineers were energetic in promoting the use of magnesium alloys and in utilizing previously unworked iron ores. Word came of a new process for rapid saponification; the "Igepals" are new detergents of German origin; a German factory is making soap from fat derived from coal; the solution of problems of producing fatty acids economically from petroleum is being zealously sought. German technologists introduced more refined processes in the coking industry of the Ruhr, increasing yields, particularly of benzene. By one process, we are informed, about 80% of the sulphur produced in coking can be recovered. Lately Germany has turned to anthracene as a raw material for making carbon black. German chemists demonstrated that coal-tar oils can be used as fuel for Diesel engines, if there are added small amounts of "Kogasin," an intermediate product of the Fischer synthetic gasoline process. A new process for the manufacture of triacetylcellulose was announced. Germany is engaged in building up a large synthetic rubber industry, based on a product termed "Buna." Leather-like products from plastics were developed. A new German raw material for varnishes and plastics is cellulose acetobutyrate, and a novel German plastic is "Astralon," a cousin of American "Vinylite." A new chemical filter material and fibre ("Zellwolle") appeared, as did new developers of the pyrogallol series.

In Great Britain the Department of Scientific and Industrial Research, through the organizations working productively under its aegis, added bountifully to scientific and technological progress. The British Nonferrous Metals Research Association reported work on the properties of lead and lead alloys in relation to important uses, published research on the effects of impurities in copper, and described the mechanical properties of magnesium alloys at elevated temperatures. The Building Research Board, active for eleven years, made substantial progress toward the solution of problems involved in the use of such constructional materials as cement, stones, plaster, and mortars. Wood preservatives were investigated broadly by the Forest Products Research Board. Advances in lubrication were considered thoroughly by the Institution of Mechanical Engineers in a symposium of 140 papers. A new liquefied petroleum gas was introduced and the search for petroleum in Great Britain was continued. Further progress in low-temperature carbonization of coal and in oxidizing ethylene with air was reported. The Rothamstead experimental station paid much attention to insecticides and weed killers and to liming of soils. The Medical Research Council investigated the health effects of industrial solvents. The Food Investigation Board has been studying problems in the transport and storage of food, and has under development the shipment of tropical fruits, especially conveyance under gas storage. The growth of plastics revived the manufacture of synthetic phenol, dormant since the World War. The Water Pollution Research Board worked on the

use of synthetic resins for water softening. A firm announced a process whereby a wool-like character can be given to rayon staple fibres and "Velan PF," a new water-repellent material for textiles was exhibited. All the varied interests of the dye consumer are covered by British specialists.

In Hungary, the demand for aluminium has fired the ambition of Hungarian scientists to find new methods of ore location and treatment. The availability of agricultural wastes for motor fuel is being studied in this country, which produces no gasoline, and a quest for petroleum is likewise being carried on.

In India, the Institute of Science gave out results of five years of research on the utilization of cane molasses and also described sirup and soap from cashew. A jute research laboratory was opened in Calcutta. The Government's Industrial Research Bureau published a broad study of Indian vegetable oils. The Lal Research Institute at Namkum, established in 1935, is investigating shellac.

Italy claims self-sufficiency in nitrogen products, now having thirteen nitrogen-fixation plants. Much scientific attention was accorded to the explosives and heavy chemicals industries, and improvements were made in the production of barium sulfate and titanium oxide. Tuscan soffioni are being used to produce electrical energy, borax, and boric acid. The Florence Experimental Institute made optical glass. A new process applied in Cogne is said to harden ordinary mild steel without tempering. The production of synthetic gasoline and lubricants by hydrogenation of coal advanced to the commercial stage. The tannin and dye resources of Ethiopia were studied, a synthetic rubber research institute capitalized at two million lire was reported, and a company set aside six million lire to study rubber substitutes and six million for research on cables. The textile industry has been well developed by science, and the utilization of by-products of wine culture is being investigated.

Magnesium industrialists of Japan are said to be trying new methods of electrolysis. A coal liquefaction process was described after sixteen years of research, and investigations on petroleum refining and on electrochemical products have been active. Use for shark oil were found, among them as a lubricant in aeroplane motors. Japanese manufacturers of paper, other cellulose products, textiles, dyes, and plastics are going forward through research. A process for making fibre from seaweed has been reported.

In Sweden research was started on the utilization of feldspar a new process for producing and briquetting charcoal was worked out, and the value of arsenic preparations in preserving wood was investigated. Swedish scientists also embarked upon research on the use of straw for industrial purposes.

In the United States, during 1936 and 1937, about \$350,000,000 was spent by the process industries in buying modern equipment to replace antiquated machinery, and in constructing new plants to enlarge production facilities. The heavy chemicals, pulp and paper, rayon and transparent wrapping film, coke and manufactured gas, petroleum refining, and distilling industries have been foremost in this industrial development. American railroads are experimenting on light-weight equipment, from the rails up. Physicists are endeavouring to introduce their services to the industries and a new periodical, *Journal of Applied Physics*, made its appearance in January, 1937. The Farm Chemurgic Council is forming State councils. Battelle Memorial Institute principally concerned in fuel and metallurgical research, expanded its facilities. The new building of Mellon Institute was dedicated. A number of large educational and company laboratories were erected during the year.

Some of the accomplishments of research during 1937 may be mentioned. Spodumene was put to work to produce lithium chloride for use in the conditioning and drying of air. A device

Employing sound waves to combat smoke and fumes was announced by the Bureau of Mines. A new inorganic cement and adhesive ("Hubbellite") and a new series of super-refractories ("Monofrax") were developed. A novel synthetic insulating compound was introduced for cables; a new flame-proofing material for textile fabrics and paper was announced. New plastics came in both liquid and powdered forms. The largest plastic piece ever moulded, a reflector 26½ in. in diameter and 11½ in. in depth, was produced from the synthetic resin "Plaskon." Food preservation is being investigated on a large scale.

Among other recent American research creations are new adhesives from synthetic resins; cellulose sponge; new pigment dyes; novel emulsifying agents; "Triton B," an organic base; new plasticizers, such as naphthyl-beta-mercaptan for rubber; plastic wood; rapid drying ink; morpholine, a new solvent; "Tergitols," compounds for use as wetting agents; tetraphosphoric acid; a titanium silicate pigment; electrolytically coloured metals; and synthetic ascorbic acid (vitamin C) prepared from sorbitol, which, in turn, is made from corn sugar.

Vitamin A is being produced from fish-liver oils by molecular distillation.

U.S.S.R. has been showing definite growth in technical publications. In 1937, the "Third Five-Year Plan" for industrial research was formulated by the Academy of Science, and the Soviet continued to progress in research on oil-shale, peat, fertilizers, synthetic nitrogen, synthetic rubber, soaps, essential oils, and pharmaceuticals. Attempts to gasify coal underground were renewed.

As to industrial research in other countries, Australia has a Productive Council for Scientific and Industrial Research, active for eleven years. Austria studied its petroleum, whose production has been increasing. The Ministry of Agriculture of Brazil described deposits of tantalum, beryllium, uranium, and rare earths in that country. The characteristics of copal resins were also investigated in Brazil. German chemists are aiding Brazilian authorities in an effort to discover uses for surplus coffee. The Minister of Public Health of Chile decreed after research that table salt for human consumption shall contain 4% of sodium phosphate, owing to lack of phosphorus in the Chilean diet. An Academy of Technical Sciences was formed in Denmark to encourage industrial research. Research in Norway, on the production of refractories from rocks such as chrysolite and serpentine by fusion with magnesia, was divulged in the literature.

The production of whale-liver oil gave promise of becoming an important Norwegian industry. Switzerland maintained a pre-eminent position in research on fine chemicals, especially pharmaceuticals.

(E. R. W.)

## Infantile Paralysis.

Nearly thirty years ago, Dr. Karl Landsteiner, of Vienna, transmitted infantile paralysis from children to apes and monkeys, and proved that the disease was caused by a virus too small to be seen by the most powerful microscope. The past two years have seen the confirmation of a discovery nearly as important as Landsteiner's, which made it possible to study this disease in the laboratory. This new discovery has revealed a curious trait, really a weakness of the virus that gives hope of a successful mass attack upon it. It now appears to be certain that this extremely minute wrecker of nerve cells can propagate itself and travel through the bodies of monkeys and men only inside of nerve cells and nerves. If that is true then, except in rare instances, the paralyzing invader has only one gateway into human beings; and that is by way of the tiny endings of the nerves of smell, high up inside the nose. If this is the only means of entry of the invisible virus, may there not then be some means of blockading against it?

In the experimental infantile paralysis of monkeys, a most powerful and simple way of protecting these animals against the virus has been discovered by American investigators, Charles Armstrong and Edwin W. Schultz. Mixtures of picric acid and alum, instilled into monkeys' noses, guard a great majority of these animals from heavy inoculations of infantile paralysis virus for at least one week.

Better yet, one per cent zinc sulphate solution—harmless to monkeys and men—protects nearly one hundred per cent of monkeys against repeated and overwhelming inoculations of deadly virus for one month and often for two months. Will it be possible by means of this solidly confirmed laboratory science, to protect children against epidemic attacks by the virus?

The field test of this hopeful science is an extremely difficult one because of the relatively small number of human beings attacked in the most severe epidemics. This makes it necessary to test any hoped-for preventive upon very large numbers of people, very rapidly, because infantile paralysis epidemics are explosive, rising to their peaks suddenly, and quickly fading away. Simple means of applying zinc sulphate to children, by practising physicians under the direction of specialists are now being worked out. The recently organized National Infantile Paralysis Foundation is going to make a truly adequate human field test of the experimentally powerful preventive possible. Funds furnished by the foundation will make possible the mobilization of an infantile paralysis-fighting army of physicians and nurses, working in concert with Federal, State and local health men. The next three years should bring the answer to this question: will what works for monkeys work for men?

(P. DE K.)

**Infant Mortality.** The most common method of measuring the mortality of children under one year is to relate the infant deaths in a calendar year to the births in the same calendar year. This infant mortality rate exceeded 300 per 1,000 in Bavaria and Württemberg in the '70s, and it is probably still as high today in large parts of Africa and Asia. The rate has been below 50 in Norway since 1929, in Sweden since 1933, in Holland since 1931, in Switzerland since 1932, in Australia since 1929, and in New Zealand since 1920.

In the United States, England, and the Union of South Africa (whites), it is about 60.

Infant mortality rates in 25 countries for the years 1932-33-34, as reported by the U.S. Bureau of the Census, the latest comparable, official figures that include the U.S.

	1932	1933	1934

(R. R. K.)

**Inflation.** No catastrophic inflation occurred during 1937. In the absence of unmistakable instances, the existence of inflation may be a matter of opinion. Currency inflation is recognizable either by its ultimate cause (unbalanced budgets or other public policy involving an expanded credit base) or by its intermediate effect (expansion of currency and credit in circulation), or by its secondary effect (a general rise in prices, not caused by diminishing returns, monopoly, or restriction of supply). Examples of all these phenomena were present in 1937.

In the United States, an unbalanced budget was counteracted by the building-up of social security funds. The realized budgetary deficit in 1936-37 was \$2,811 millions. The ordinary British budget was balanced, but rearmament borrowing was begun on a scale of £400 millions in five years. Any inflationary effect, however, was offset by the accumulation of reserves in the unemployment insurance fund and increases of other Government-controlled funds. In France, the Government proposed to balance the budget in 1938 after a sequence of deficits, but France had also a large extra-budgetary armament program. Big defensive expenditures, financed by credit, were a feature of the economies of Germany, Italy, and certain other countries, invalidating their published budget figures.

The conflict in China inevitably caused an inflationary increase of Japan's governmental spending.

In the United States, neither money in circulation nor bank deposits showed any significant rise. A rise in British currency circulation was common in 1937. Bank of England notes in circulation rose from £467 millions at the end of 1936 to £505 millions 12 months later, although some hoards of notes held on continental account had been liquidated meanwhile. In France, following a sharp depreciation of the franc, the volume of notes in circulation rose from 85,985 million francs in June 1937 to 91,370 million francs in September. The German note circulation rose from r.m. 6,653 millions in September 1936 to r.m. 7,259 millions 12 months later. A similar annual rise of around 10% was common, for instance, in Argentina, Japan, the Netherlands, Norway, and Sweden. No such rise, however, could be called inflationary, and in other countries, such as Austria and Belgium, the note circulation fell.

The inflation of prices in 1937 was indubitable but temporary. Thus, wholesale prices of primary products in Great Britain rose by more than 20% between November 1936 and March 1937 but fell back to their former levels within a few months. There was a parallel inflation and deflation of stock-market prices both in London and in Wall street.

(H. V. H.)

**Inner Mongolia:** *see* MONGOLIA.

**Insanity.** Advances in psychiatry in 1937 have largely been made in the field of experimental therapy. Sakel's insulin hypoglycemic shock treatment of schizophrenia, originally used by him in Vienna in 1933 and first reported in 1934, has been widely adopted in other clinics throughout the world. The results are promising and the association between insulin treatment and clinical improvement is occasionally very striking. Published statistics, however, must be regarded at present as tentative in view of the difficulties in the diagnosis of schizophrenia and the variability in spontaneous reactions which the disease often shows in response to physical and psychologic treatment, or no treatment at all. Although Sakel's method is violent and sometimes dangerous, one is justified in using it in such a serious disorder. Psychiatrists are unable to say that the favourable results, when obtained, are permanent. Transient improvements of a similar nature have been observed after the administration of high percentages of carbon dioxide and other forms of treatment

used in the past. Another form of "shock" treatment has been under investigation in 1937. Meduna of Budapest has used "convulsive therapy" induced by rapid intravenous injections of metrazol, a drug similar in action to camphor, producing epileptiform seizures. It is claimed that after a period of confusion and somnolence the patient's mental condition is greatly improved. One or two reports from other investigators are favourable, but the treatment is too new to evaluate. Finally, the reports on the use of theelin in involuntional melancholia, a disease of the climacteric, continue to be favourable and recovery, when large doses are given, has occurred in upwards of ninety per cent of patients with this affliction, the period of hospitalization, at the same time being reduced by one-half.

Work has continued on the surgical treatment of the psychoses, as advocated by Moniz in 1936. Destruction of some of the numerous connecting fibres of the frontal lobes has led to amelioration of such symptoms as anxiety, apprehension, nervous tension and insomnia. This radical method of treatment is still under investigation and has not been widely used. No conclusions, except great caution, are justified at present.

Another investigation during the year was the continued study of the action potentials of the brain with the recording of them by the electroencephalogram. These researches have led to important conclusions regarding epilepsy, sleep and cerebral localization of function. All investigators have found a spontaneous cerebral rhythm, which can be recorded as an electrical current from electrodes placed on the scalp. The normal rhythm, about ten per second, reveals some inborn feature or pattern of cerebral activity, not understood at present. The electroencephalograms appear to conform to the biological law of similarity of identical twins.

In disease, certain wave changes are pathognomonic of petit mal, a form of epilepsy. Investigation of electroencephalograms of patients with mental deficiency and psychoses reveals certain changes not yet interpreted. There are indications, however, that such studies may aid in the estimation of the severity of the psychosis and as a measure of therapeutic efficacy.

A most important field of research has not been neglected. With many modern forms of treatment now in use for a considerable period of time, thoughtful physicians are attempting to evaluate the results of their endeavours. Psychoanalysis, the most complicated therapeutic measure employed at present, is felt by most workers to be valuable in a selected group of patients suffering from the more severe forms of the minor psychoses. In general hospitals, where only modified psychotherapy can be used, about sixty per cent of the patients are considered to be improved as the result of treatment in an established ambulatory psychiatric clinic. More than one-half of the patients with neuroses may be improved with something less than "intensive psychotherapy" of the psychoanalytical type.

Thus, the more simple methods of treatment are not to be discarded, in spite of the acknowledged value of psychoanalysis in certain cases.

In general, as diagnosis and classification of the psychoses become more fixed, research turns towards the therapeutic field. The work of 1937 is encouraging, for not only has much been accomplished, but many new pathways of investigation have been opened, many of which appear to offer great promise.

(H. R. V.)

**Insects:** *see* ENTOMOLOGY.

**Institute of Chemistry:** *see* CHEMISTRY, INSTITUTE OF.

**Institute of Pacific Relations:** *see* PACIFIC RELATIONS, INSTITUTE OF.

**Institute of Physics:** *see* PHYSICS, INSTITUTE OF.

**Insulation**, or any material designed specifically to prevent heat loss or heat penetration, has been strictly a product of industrial progress. The first recorded use of insulation for the purpose of conserving heat to do useful work was when James Watt bound strips of wood around the boiler of the first practical steam engine, invented by him in 1765. At that time and for well over a century afterward, fuel was plentiful and cheap, and as a result, very little necessity was seen for any insulation at all.

Since that time industrial progress has been predicated upon man's increasing ability to harness heat to do useful work. In time this progress brought the development of open hearth furnaces, ceramic kilns and other high temperature furnaces where insulation is not only desirable in order to keep production costs low, but a necessity in order to make possible many industrial processes based on reactions which take place within narrow temperature ranges, and which could not be successfully carried on at all without the close temperature control made possible by insulation.

The insulation industry has kept pace with industrial progress to the extent that today there is a type and form of insulation available to meet every industrial need. These advances in insulation are conservatively estimated to save industry well over \$300,000,000 annually.

Industrial insulations available today may be divided into three main groups. (1) High temperature insulations (above 1,000°F.), which control heat used in making steel, glass, petroleum products, cement and other products in wide every day use. (2) Moderate temperature insulations (from 100° to 1,000°F.) for conserving heat in boiler drums, steam lines, heated tanks, etc. (3) Low temperature insulations (sub-zero to 100°F.) for preventing heat penetration into refrigerated spaces and into cold water or refrigeration piping.

The most recent advance in the industrial insulation field has been the development of insulating refractories, now being produced by both insulation and refractory manufacturers. This type of material combines the advantages of both insulation and refractory. Where conditions permit the use of this type of material, considerable savings in furnace construction and operating costs can be effected.

The greatest progress in recent years, however, has been in the development of insulations scientifically designed to increase man's comfort. These insulations include materials for insulating homes, automobiles, aeroplanes and automobile trailers. Home insulation in the past decade has become an industry in itself, and with air conditioning, which necessitates the use of insulation to be fully effective, rapidly increasing, the insulation of homes seems sure to become more and more important. Materials available for home insulation include rock wool and similar materials in blanket, loose and nodulated or granule forms, and reflective type insulation.

Of interest because of the increasing desirability of fireproof ship construction is the recent development of a light weight, fireproof insulating material specifically for use aboard ships.

(L. H. BR.)

## Insurance, Accident and Automobile.

A glance at the 1937 accident statistics for the United States explains the popularity among Americans of accident insurance, for in that year 106,000 persons were killed in all types of accidents, 375,000 injured permanently and 9,400,000 injured temporarily. Doubtless the publicity accorded these tragedies made the country accident-conscious and therefore helped to build the accident insurance business to its present status where it ranks

third in the field of casualty insurance, with a premium volume in 1936 of \$99,826,696, exceeded only by automobile liability and workmen's compensation insurance.

Accident insurance, dating back to 1850, indemnifies an individual or his beneficiary for financial loss caused by accidental bodily injuries to himself. There are three major forms written: commercial, industrial and non-cancellable, but the latter form has been discarded by most companies because it has proved highly unprofitable, with commercial accident policies achieving the greatest degree of popular support. Accident and Health Insurance Week, occurring in the latter part of April and for several years past an annual observance in the United States, definitely stimulates the public consciousness insurance-wise.

Automobile insurance is another development more or less peculiar to American insurance needs and methods, offering a five-fold protection: fire and transportation; theft; collision; public liability and property damage. Of these, perhaps collision is the only form that has, strangely enough, decreased in popularity. Ever since the world's first automobile policy was written, February 1, 1898, automobile insurance has increased spectacularly in the United States until it is now the chief source of premium income for casualty insurance companies and contributes 25% to fire insurance premium volume. In 1936, automobile liability insurance premiums totalled \$279,120,129, while those for automobile property damage insurance were \$78,432,904. Motor vehicle premiums for fire insurance companies reached the total of \$168,810,633. Estimates based on early returns for 1937 indicate an increase of approximately 8% for casualty companies and 4.5% for fire companies.

Experience on automobile insurance was profitable in 1937 despite the fact that accident fatalities increased. Factors leading to this result were an adequate rate level; continued nation-wide work in safety education; a trend toward stricter motor vehicle regulations, and renewed vigilance of insurance carriers co-operating with public prosecutors in running down fraudulent claimants. During the closing months of 1937 one outstanding development threw the automobile insurance picture into sharper focus. This was the plan authored by the National Bureau of Casualty & Surety Underwriters, a rating organization sponsored by 38 member companies operating in the United States and Canada. This proposal, similar to that used in England, offers a return of 15% of the premium to drivers whose record for the year is free of accidents or claims. There has been considerable opposition to this plan, chiefly from insurance agents and brokers, as well as proportionate approval, chiefly from automobile owners.

(T. J. V. C.)

**Great Britain.**—The year 1937 has seen a sustained expansion in the turnover of business written in the accident department, which has applied in greater or less degree in all countries of the world. The predominant cause of this has been the continued growth of motor insurance, which holds the leading place among the various sections of the business. The total premiums written by British offices in motor insurance during 1936 as disclosed in the reports published during 1937 amounted to £35,210,019. This business was derived from all parts of the world, since British insurance interests are on an international basis. The largest national market for motor insurance is in the United States, which country possesses far more motor vehicles than any other country.

The experience of motor insurance as disclosed during the year was not very profitable, though in England an aggregate profit of 3.4% was secured. Continental motor insurance has been unprofitable for a number of years, particularly in France and central Europe, though some improvement was recorded last year. The cause of the difficulties is the increase in the number of road

accidents and the sharply upward trend of their average cost. Rates of premium have not been advanced enough to keep pace with the increased claim strain. This applies particularly to the third-party liability in connection with the rise of motor vehicles.

Personal accident insurance, the third principal section of accident business, includes also insurance against disablement through disease or sickness. The experience has been variable, with an increased claims cost in many countries due to the greater street hazard associated with increased traffic. The premiums written by British offices during 1936 amounted to £3,541,214, and the trading showed a profit of 5.5%. Personal accident insurance is treated differently in different countries. The scales of benefits payable are differently constructed, while each country has its

SWEDISH MODERN FURNITURE developed in 1937. The upholstery fabrics, rugs and glass are also of Swedish design

own methods of classifying risks and computing premiums. In England the business is profitable, but on the continent of Europe it has been much less favourable. (See also FIRE INSURANCE; LIFE INSURANCE; MARINE INSURANCE.) (C. E. G.)

**Insurance, Old Age:** see SOCIAL SECURITY.

**Intelligence Tests:** see APPLIED PSYCHOLOGY: *Intelligence Tests*.

**Inter-Allied Debts:** see WAR DEBTS.

**Interior, Department of the:** see GOVERNMENT DEPARTMENTS AND BUREAUS.

**Interior Decoration,** apart from that in "period" styles (for which see *Encyclopædia Britannica* vol. 12, 474-96), has exhibited simple but bold manipulation of surfaces and masses in keeping with the mathematical lines of modern exterior architecture. For embellishment, excrescences remain out of favour, and designed patterns have continued largely to give place to the exploitation of plain colours, though of unexampled richness and variety, and above all of the texture or figuration inherent in the myriad materials now available, whether plaster, timber, or fabric. With mouldings in banishment, the flush door rules; floors, walls, and ceilings show unbroken surfaces and tones; furniture is long and low. Only in hangings is the feeling for pattern indulged; curtains, indeed, display kaleidoscopic intricacy.

**Floors.**—For a bare floor, with or without small rugs, parquet is ideal. In default, laminated parquetry may be laid on an ex-

isting floor, or, if this is of satisfactory timber and (as it should be) secret nailed, it may be finished with one of the polish-stains made for the purpose. Plain "battleship" linoleum and rubber (increasingly) have their adherents. These and carpets give warmth, and the last, if laid over an underfelt, even on indifferent flooring, wear. For kitchens and bathrooms patent composition floorings are also in vogue; for the latter cork parquet excels.

**Walls.**—Smooth or textured plasters may be finished in distemper (preferably oil-bound), or oil-paint or cellulose lacquer, dull or glossy, often sprayed on. Spraying opens up wide possibilities in the application of metallic dusting or a transparent finishing coat of a contrasting tone. Wall-papers, though some are discreetly patterned, frequently re-

on texture too, some simulating linen or leather. Actual linens and canvases are sometimes used. Plywood can be applied in matched veneers even on extensive wall-surfaces.

The choice of hangings is almost limitless. Picturesque fabrics including some of peasant origin, are on the market from all over the world; tapestries in imitation of stained glass are an example.

If the fireplace is retained, it is usually built flush; but it is largely giving way to the electric or gas fire, also sunk flush, or well above floor-level, in the wall.

For pictures the comparative smallness and lowness of modern apartments gives sparing occasion. But mirrors are used decoratively, and glass panels, perhaps etched or engraved and illuminated with concealed tinted lights.

**Furniture.**—Furniture of today is clean of outline and, as far as may be, without legs. The wooden pieces might have been tooled into cubes and slabs, with rounded edges and corners the only concession by the machine. The style relies on showing up the natural figure of the wood. Very beautiful timbers, hitherto little known, are brought from the world's forests; veneers of a variety on laminated wood cores are widely used by cabinet makers, usually matched and sometimes inlaid. Clear cellulose lacquer gives a finish indestructible and equal in appearance to that of French polish. In upholstered work a little more latitude of form is allowed. The cylinder may be combined with the block, the squabs may depart from strict rectangularity, and they will be inclined at easy angles—for comfort is studied as never before. In really small rooms built-in furniture saves space.

**Artificial Illumination.**—Concealed lighting is prevalent. Few modern rooms have cornices, but deep bowls, either on movable standards or affixed to walls, project flood-lights to be reflected

from the plain white ceiling. Strip-lights, too, lend themselves to concealment—for example, within picture-frames or even under table-tops and so forth, or may be mounted in troughs designed for them.

(H. Fw.)

## International Labour Office.

The I.L.O. in 1937 represented 62 States, including all the leading countries except Germany. Italy, however, following her resignation from the League, resigned at the end of the year. The U.S.A., the U.S.S.R., and Japan are all members, the two former being recent recruits. During the year 1936-37 there were, in all, 50 ratifications of conventions adopted by the I.L.O., including eleven by Great Britain, of which six dealt with age and widows' pensions and sickness insurance, and none involved any substantial advance on existing British practice. In general, the progress made with ratifications remained very slow. Fourteen of the fifty came from South and Central America, and only thirteen from continental Europe.

The 1937 conference of the I.L.O. was concerned largely with proposals for the adoption of the 40-hour week, subject to certain modifications and exceptions, in the textile, chemical, and mining industries, and with the planning of public works as a means of preventing unemployment. The draft convention for the textile industry was accepted by the necessary two-thirds majority (88 votes to 41); but the conventions for the chemical and printing industries, though approved by a majority of the delegates, fell short of the requisite two-thirds, and were accordingly not carried. The conference approved resolutions dealing with the rational planning of public works in advance, in order to combat trade depressions, and with international co-operation in respect of public works. It also revised the earlier convention dealing with the minimum age of employment for children in industrial and non-industrial occupations, with the general object of raising the minimum age from 14 to 15.

The governing body of the I.L.O., as elected in 1937, consists of 16 Government members (representing U.S.A., Canada, France, Great Britain, India, Italy, Japan, U.S.S.R., Brazil, Chile, China, Mexico, Norway, Poland, Spain, and Yugoslavia); 8 employers' delegates (from Great Britain, France, Denmark, Italy, India, Yugoslavia, South Africa, U.S.A.); and 8 workers' delegates (from Great Britain, France, U.S.A., Belgium, India, Japan, Spain, Sweden); together with substitute members from a number of other countries.

The I.L.O. now publishes, in addition to the *I.L.O. Year Book*, separate *Year Book of Labour Statistics*, as well as the monthly *International Labour Review* and its various series of studies and reports dealing with particular subjects. It remains integrally connected with the League of Nations, all League states being automatically members of the I.L.O., as well as certain others (e.g. the U.S.A.). Representation at conferences is in the proportion of two Government delegates, one employers' delegate and one workers' delegate from each country, though some countries (14 in 1937) are in fact represented only by Government delegates. Each delegation is allowed the use of substitute members, in order that it may be represented by persons expert in particular subjects discussed. States are obliged to submit to I.L.O. conventions to their respective parliaments (or other appropriate bodies); but each state is free to ratify any convention or not. In all, up to March 1937, the I.L.O. had adopted 14 conventions, and registered 739 ratifications, including 30 from Great Britain.

(G. D. H. C.)

## International Law.

Perhaps the most significant event of a year not noted for renunciation of foreign claims, is the coming into force of three of the con-

ventions signed at the Hague Codification Conference of 1930. Each of these conventions has now been ratified by the required ten or more countries.

The principal convention, relating to certain conflicts of nationality laws, facilitates renunciation or waiver of one's nationality, by the person himself or by the country with the lesser claims, in certain cases of dual nationality. For example, third States are to recognize exclusively the single nationality of the country in which the dual national is habitually resident or most closely connected. The chapter on the nationality of married women provides for a limitation in the number of cases of dual nationality or statelessness arising through marriage. Children of unknown parents or parents of no or unknown nationality shall take the nationality of the place of birth. Among the ten States that have now ratified, the largest are Great Britain, India, China and Brazil.

The convention of most interest to and the only one ratified by the United States, is that relating to military obligations in cases of dual nationality. Adopting a principle long urged by the United States, this provides that a person having dual or multiple nationality shall be bound to perform military service only in that country in which he habitually resides or with which he is most closely connected. Among the Powers which have ratified this convention in addition to the United States, are Great Britain, Brazil, India, Australia, and South Africa. It has not been ratified by France, Italy or Switzerland, with which the United States has had the most difficulties in this matter of military service.

A third convention provides that in countries not conferring their nationality *jure soli*, a person born of a mother who was a citizen and of a father without nationality or of unknown nationality shall have the nationality of the country of birth. This has been adopted by Great Britain, Brazil and several of the British dominions. This is already law in the United States.

**War in China.**—This conflict has raised some interesting legal questions. War was not declared either by Japan or China, but in this they have tradition behind them. War is a fact, and does not depend on declaration or the name given it.

It is doubtful whether the Nine-Power Treaty has really been violated, for the "territorial and administrative integrity of China" which the signatories agreed to "respect," has not actually existed since 1842, when the western Powers began to encroach upon it by territorial seizures, tariff limitations and armed occupations of Chinese territory.

The British Government sent a well-framed note to Japan protesting against the bombing on an open road of the British Ambassador to China, on the ground that it was "wanton" and therefore illegal promiscuously to bomb civilians outside a war area, and emphasizing again the fundamental distinction between combatants and non-combatants.

The "Panay," an American gunboat on the Yangtze river, was sunk on Dec. 12 by Japanese bombs together with some American-owned oil barges. Three American lives were lost. British ships were also struck, with loss of life. In both cases Japan disavowed the bombing, attributed it to a mistake, and offered indemnities and guarantees against repetition. An American note of Dec. 25 warned Japan against any further attack on American nationals, property or interests. If this is intended to include attacks in war zones, it goes beyond the exactions of international law and may give rise to difficulties.

**Civil War.**—The Spanish Civil War raised a number of important questions. The Non-intervention Committee at London, with the announced purpose of preventing the spread of the conflict, undertook to bar arms, ammunition and implements of war from both Loyalists and rebels. The United States followed suit by a resolution of Jan. 9, 1937, now formally adopted as part

of the Neutrality Act. The refusal of countries to supply the recognized Spanish Government with arms, but on the contrary to deal with rebels and Loyalists as if they were on an equal footing, raised the question whether this was not a breach of international law, which requires friendly Governments to help a constituent Government, at least by continued trade in arms, to resist a rebellion. (See also NON-INTERVENTION COMMITTEE.)

On the other hand, the long-continued bargaining whether the belligerency of the Franco rebels should be recognized (as a condition of the withdrawal of outside "volunteers") was probably also a departure from international law; for after July, 1937, when Franco controlled two-thirds of Spain and of its population, the rebels could hardly legally be denied the status of a belligerent. The supersession of political considerations upon the legal questions made the case unique. Germany and Italy indeed in 1936 had recognized Franco as the only Government of Spain, and had assisted Franco with material aid. This was clearly an act of political intervention. Finally, when merchantships on their way to Barcelona and other Loyalist ports were sunk at sight in the Mediterranean, the Powers met at Nyon to take measures to stop these acts of "piracy," for the identity of the attacking vessels remained undisclosed and no Government would assume responsibility for them. (See also MEDITERRANEAN, THE.)

Incidental to the Spanish War, the Loyalists attempted to requisition Spanish merchantships in various foreign ports and take possession thereof through Spanish consuls. In some of these cases the owners filed a libel to recover possession of their vessels, and the question arose whether the Spanish requisitioning decree could be given effect abroad. In the case of the "Navemar" requisitioned in Argentina and brought to New York and there libeled, the Circuit Court of Appeals gave effect to the decree partly on the ground that a ship is part of a nation's territory, that the change of ownership had been recognized in the Argentine, that

"SANK ONE OF HIS OWN, TOO," says Lewis the cartoonist in *The Milwaukee Journal*

the allegation of the public character of the vessel advanced by the Spanish Ambassador could not be disputed in an American court, and that the ship under the Spanish flag was "within Spanish jurisdiction" (90 Fed. (2d) 673). The case is under appeal to the Supreme Court. In a test case in England, the "Christina" (5 Lloyd's Law Reports 1), a somewhat similar conclusion was reached.

The question of ships is different from that of private property on land. Conflicting claims to the ownership of property sent out of Spain under Government orders have come before the French courts. These courts protected the rights of the person whom they found to be the legal owner under rules of French private law. This was the case with a consignment of potassium sent from Barcelona to Marseilles, *Moulin et al. v. Volatron*, 64 Clunet 531. See also *Rousse v. Banque d'Espagne*, 1937, Dalloz Rec. Heb. 461.

**Private Property.**—American and British courts in 1937 dealt with a number of other interesting cases involving private property in international law. Under the Roosevelt-Litvinoff Agreement of 1933, assigning to the United States the assets of Soviet Russia in the United States, the Attorney General brought suit against Belmont & Company, bankers, claiming title to a bank deposit made before 1918 by the Petrograd Metal Works. The United States claimed that the Soviet Government had purported to dissolve Russian corporations and confiscate their property and assets. The U.S. Supreme Court held, with doubtful validity (30 U.S. 324), that the Russian decree purported to confiscate the bank deposit in New York, that it could legally do so, and that the United States by executive agreement could become the successor in interest of the Soviet. The case arose on a motion to dismiss without opportunity for the original owners of the deposit to be heard. For that a new action will be necessary. The Belmont case is unique among the Western nations.

"JUST TO AVERT MISUNDERSTANDINGS." Polite apologies cannot justify, explain or atone for a bombing tragedy, cartoons Elderman in *The Washington Post*

Another chapter was written in England to the Finnish ship claims. During the war in 1915 some thirteen Finnish ships were requisitioned in Great Britain on authority of the then Russian Government. The owners claimed compensation from Great Britain under the Indemnity Act. Losing the case, on the ground that Russia was liable, Finland brought their cases before the Council of the League under Article 11 of the Covenant on the ground that the issue jeopardized the friendly relations of two countries, Finland and Great Britain.

The Council rejected the claim, although in the meantime the issue gave rise to an arbitration involving the question whether the Finnish owners had exhausted their local remedies in England. To this an affirmative answer was given by the arbitrator, Judge Hagge, of the Supreme Court of Sweden, in a notable opinion exploring the local remedy rule. The Finnish shipowners, turned down at Geneva, then began suit in the King's Bench in England against Baring Brothers, bankers of the old Russian Government, claiming a declaratory judgment that both before and after the Soviet Revolution the Russian authorities had given the owners an assignment of part of the funds on deposit with Baring Brothers. Mr. Justice Luxmoore denied that an assignment had been proved (*London Times*, Nov. 20, 1937).

**Recognition and Non-recognition.**—Although at Geneva Great Britain and other Powers agreed in 1936 not to recognize Italy's conquest of Ethiopia, the exigency of practical affairs required different decisions. In 1937, ousted officials of the Bank of Ethiopia brought in England an action for a debt owed to the bank by an Egyptian bank. The British Foreign Office, on request, advised the Court that the Italian control of Ethiopia had been recognized *de facto*. Thereupon the Court held that only the Italian liquidator of the Bank could represent it to collect debts. *Bank of Ethiopia v. National Bank of Egypt* (53 Law Times 751). Thus, the doctrine of non-recognition of obvious facts suffered further impairment. As it is rather impractical and creates more political disorder than it allays, it probably ought to disappear in due course. (E. Bd.)

**International Trade.** At the end of Sept. 1936, the Tripartite Monetary Agreement was signed between Great Britain, France, and the United States. Under its signatories promised to assist each other to maintain monetary stability, and also to refrain from competitive currency depreciation. It was rapidly adhered to by other countries, and is generally heralded as providing a new basis for the freeing and revival of international trade.

How have these hopes so far been fulfilled? The story of 1937 must clearly take this as its starting-point, but it is equally necessary to have regard to the background of the tripartite agreement. This takes us back to 1931-32, the years in which Great Britain abandoned the gold standard and introduced her tariff; the years when many countries first introduced exchange restrictions and imposed quantitative quotas upon imports of many commodities.

The history of 1931-36 must first be summarized. In England there was the change over to protection in 1932. This was followed by the Ottawa agreement, under which the various members of the British Empire gave each other preferential duties on various classes of goods. Now, clearly if England gives Australia a preference of 15% in respect of certain imports from Australia, England must impose a duty of at least 15% upon imports from other countries, or else the Australian preference cannot be maintained in full, even if the Australian goods are let in duty-free. Ottawa was followed by commercial treaties between England and certain foreign countries, such as the Scandinavian powers, Germany, and Argentina, under which mutual concessions in respect

of duties and import quotas were made. It was also followed at home by measures to organize the production and marketing of certain classes of British agricultural produce, and these entailed fresh control over imports, both by way of duty and of quota. In certain cases such as wheat, a duty was levied on imports for the purpose of subsidizing the home producer. Meanwhile, the United States was busy negotiating commercial treaties with foreign powers, while the depression and the glut of such commodities as cotton, tin, and rubber led to the introduction of national or international schemes for the control of production, and these in turn affected international trade.

During all this time, Central Europe, the Balkans, and most of South America were enmeshed in a network of exchange restrictions, exchange clearings, and trade on a compensation or barter basis. Exchange restrictions began with a desire to maintain the gold value of the currency, and were applied first to prevent movements of capital out of the country, including the payment of debts due to foreigners. Then imports were restricted, both by direct quotas and also by the refusal to allot the foreign exchange needed to pay for them. Conversely all foreign exchange received by exporters and others had to be surrendered to the authorities. Next attempts were made to organize fresh foreign trade. In some cases payments agreements were concluded, under which the "weak" or restricted country determined its imports from any "strong" country solely by reference to its exports to that country. In other cases, clearing agreements between two "weak" countries laid down that importers in each country should pay for their goods in their own country, the payments being made into a special clearing account kept at their central bank. Exporters were paid out of this account. Then there were various forms of "compensation" trade, where importers and exporters got together, so that one drew on the currency obtained by the other. The essence of all these arrangements was to canalize trade country by country, with the inevitable consequence of a contraction in the total flow of world trade.

The world recovery of 1933-37 brought some easement. Austria was able to remove practically all her exchange restrictions, though she was forced to maintain the clearing agreements with many of her neighbours. Argentina relaxed her restrictions. In other cases, while the machinery of restriction remained, it operated more easily.

This brings us to the beginning of 1937. During the past year there were two important developments. The first was the visit of M. van Zeeland, who was then prime minister of Belgium, to France, England, the United States, and other countries. His visit was initiated by the British and French governments, and its object was to explore ways of bringing about a general reduction in tariffs and relaxation of import quotas and exchange restrictions.

M. van Zeeland was peculiarly suitable for this task, for Belgium together with Holland and the Scandinavian powers, had taken the lead in the low-tariff group movement of previous years. This had the object of concluding multilateral trade agreements between a group of countries, instead of bilateral agreements between countries in pairs.

It broke down, however, partly because of the Ottawa agreement embracing the British Empire—in itself a low-tariff group; partly because England insisted on her most-favoured-nation rights under existing treaties; partly because the United States believed solely in bilateral agreements; and partly because the time was not ripe for a general freeing of world trade. M. van Zeeland has been faced with a long and arduous task, for he has had to try to reconcile national and international interests, and he has realized the futility of formulating proposals which would not be generally acceptable. Nevertheless at the beginning of 1938 there were indications that he might be reaching the point where

he could put forward a definite scheme for the general relaxation of trade and exchange restrictions.

More important were the Anglo-American trade discussions. These had long been envisaged on both sides of the Atlantic, but the first tangible step was Mr. Runciman's visit to America in Jan. 1937. It was quickly clear that some modification of the Ottawa agreements would be necessary, and so the Dominions had to be brought into the discussions. A fair amount of secrecy attended the next move, but it is now clear that the question was discussed at the Imperial conference held at the time of the coronation. The Australian premier asked, however, that no overt move should be made until after the Australian elections, due to be held in the autumn of 1937. As it would have been most undesirable for the Anglo-American trade discussions to have been made an issue in a Dominion general election, this request was at once acceded to. In consequence, there was no fresh move until the late autumn.

On Nov. 18 it was officially stated that the discussions had reached the point where formal negotiations between the British and United States governments could begin. This statement received an immediate welcome from the Canadian and Australian governments. And so the position stood at the end of the year. It was clear that there would be much sectional opposition on both sides of the Atlantic, but it was equally clear that the governments concerned envisaged a successful end to the negotiations and the conclusion of a treaty embodying substantial concessions on both sides. Furthermore, as the treaty would contain the most-favoured-nation clause, most of the concessions would extend to many other countries besides the British Empire and the United States. Thus at the end of the year the Tripartite Monetary Agreement of 1936 appeared to be leading to one substantial result.

Unfortunately, there were comparatively few signs of relaxation on the part of the countries with exchange restrictions. Germany, the chief of the restricted countries, was pulled by conflicting aims. Her chief proclaimed need was for essential raw materials which she could not produce at home; and this need was emphasized by the general expansion in home industrial activity under the Nazi régime. But in the absence of any willingness to devalue the mark or revert to a free economic system, she had to measure her permitted imports by her exports; and for various reasons the recovery in her export trade fell short of her general recovery. Therefore, on the one hand she tried to give priority to those raw material imports needed by her export industries. On the other hand, she tried to make herself, through the invention and manufacture of substitutes, less dependent upon raw material imports. These aims were not wholly reconcilable, for raw material imports were needed for the factories built in pursuance of her self-sufficiency aims, and also for rearmament, which constituted a third claim upon her import trade. These divergent aims to some extent found expression in divergent schools of thought. The announcement in late 1936 and the vigorous execution since, of the second four-year plan marks the triumph of the self-sufficiency school, for that is the plan's declared objective. Certain changes in ministerial personnel at the end of 1937 may also point in the same direction.

Looking backwards from the end of 1937, things are beginning to move, but the movement is very slow. The recovery during 1933-37 in world prices and world trade has permitted some degree of relaxation, and Brazil's decision, in Nov. 1937, to place her export coffee trade upon a competitive basis is the latest example of this. Much depends on the success both of M. van Zeeland's mission and of the Anglo-American negotiations, and "success" in the latter case, means not merely a treaty but a treaty drawn on wide and generous lines, embracing a large number of important commodities. Something too depends upon whether Ger-

many, in co-operation with other countries, can find a way of combining freer external trade and exchange with her internal economic, social and indeed, political aims. Finally, much depends upon whether world currencies, and particularly the franc, can maintain a fair degree of stability, with the ultimate possibility of *de jure* stabilization as well as *de facto* stability. These are the problems for 1938 and subsequent years. (N. E. C.)

## Interstate Commerce Commission.

The financial situation of the railroads in the United States in 1937 and the need for larger revenues to meet increased expenses required and received consideration by the Interstate Commerce Commission. During the early part of the year the improvement in business conditions and the increase in the traffic of the railroads were encouraging, but during the latter half of the year railroad tonnage and revenues declined below the 1936 level, while increases in the wages paid employees, new taxes to provide the funds for unemployment compensation and retirement pensions, and higher cost of fuel, supplies and equipment added fully \$500,000,000 per annum to expenses. The railroads were not in condition to cope with the situation. For the railroads as a whole, the rate of return on property investment in 1937 was only 2.3%, or less than half the rate required for successful management and development, while companies owning 28% of the total railway mileage were insolvent and were being operated by receivers or trustees appointed by the courts.

Toward the end of 1936 the Commission refused to continue in effect after Jan. 1, 1937, a temporary emergency increase in railroad rates granted in April 1935. This reduced the carriers' freight receipts about \$120,000,000 per annum. The carriers petitioned for increases in the rates on specified basic commodities; the Commission held hearings thereon in the spring but not until October 19 were the carriers authorized to file tariffs, which became effective in November and December, providing for an estimated increase of \$60,000,000 to \$65,000,000 in annual revenue.

The situation of the railroads became progressively worse during the last four months of 1937 and the carriers, early in November, requested authority to raise freight rates 15% generally throughout the country and to make the basic passenger fare 2 cents instead of 2 cents per mile in the eastern territory. Public hearings were begun by the Commission Nov. 19, 1937, to be completed in January 1938; the Commission's decision to be announced a few weeks later. Without committing itself in advance, the Commission has made clear both in its decision of Oct. 19, 1937, and in its annual report for 1937 that it recognizes the need of the carriers for revenues that will enable them to earn a reasonable return upon a fair value of their properties, "if the system of private ownership is to function at all satisfactorily."

In fixing railroad freight rates and the charges of motor carriers over which the Commission was given authority by the Motor Carrier Act of 1935, and in maintaining a fair relationship between rail and motor rates, the Commission needs more definite information than it now has as to the costs of service. While transportation charges cannot be based solely on costs of service, the charges for different services, and the rate schedules of carriers by rail, motor, and water, should be determined with as full knowledge as can be obtained of service costs. The Commission decided in 1937 to strengthen its cost-finding procedure by adding to its administrative organization an accounting division and by allotting thereto a liberal sum from the Commission's funds.

The experience of the Commission in regulating railroad financing shows the need of additional legislation. Through the past activities of railroad subsidiaries the stockholders of several railroad companies, notably the New York, New Haven and

artford, have suffered heavy losses, while the ability of the companies concerned to serve the public has been impaired. The Commission recommends legislation that will enable it to place restrictions upon the expenditure by a carrier, or by its subsidiaries, of funds except for the operation or legitimate improvement of the property of the carrier.

As was expected, the Commission is finding the task of regulating motor carriers under the comprehensive act of 1935 a most difficult one. The regulations and the administrative procedure required for the enforcement of an act applying in many details to more than 80,000 operators, most of whom do a small-scale business, are being worked out and made increasingly effective. The Commission's experience to date leads it "to believe that in a large measure of success will be achieved."

The Commission's jurisdiction over carriers by water and by air is still unduly limited. Bills are pending in Congress, which, if enacted, will give the Commission the same general authority over those carriers as it now has over carriers by rail and road. (See also RAILROADS.) (E. R. J.)

## Intoxication, Alcoholic.

Medical literature published in 1937 dealing with the treatment of alcoholic intoxication concerns itself largely with chronic alcoholism. The trend suggests a wider interest in the subject; a tendency toward improvement in technique; a need for further study of the nature and causes of chronic alcoholism; and a need for more constructive public policies seeking to ameliorate habitual drunkenness.

As in previous years, attention was called to the need for replacing the archaic attitude of the general public toward alcoholism with a more scientific one of natural phenomena being an endless chain of cause and effect, and that the drunkard cannot be understood, satisfactorily treated, or his condition modified through an emotional outlook dominated by vindictiveness and ordinate coercion, condemnation, maudlin sympathy, or condescension.

Treatment of the physical concomitants of chronic alcoholism consists of correcting faulty nutritional situations and the inauguration of a hygienic physical régime. The insulin shock treatment has been tried in the psychoses associated with or proximal to alcoholism. The same general principles apply in the treatment of delirium tremens as heretofore, including abrupt withdrawal of alcohol; safeguarding the patient from self-injury and exhaustion, especially cardiac exhaustion; promotion of elimination; reduction of intracranial pressure by spinal puncture, intravenous dextrose, caffeine, and magnesium sulphate; and promoting adequate nutrition, in some instances employing liver extract. Paraldehyde continues as the drug of choice for sedation, but the problem of sedation in delirium tremens is not satisfactorily solved. Morphine is contra-indicated, since it tends to increase intracranial pressure. The hypodermic administration of amyl ether has been used in the treatment of delirium in pneumonia of the alcoholic.

Physical and chemical treatment so far devised offers no promise. Advocates of the "habit" or "conditioned reflex" as a cause approach the matter by contra-conditioning the patient through substitution of either a conditioned reflex of nausea or disgust for the taste of alcohol, or other substitute conditionings giving greater emotional significance to the individual than alcohol. Apomorphine or other nauseating substances have long been used to create nausea and disgust for alcohol. Other forms of substitution or contra-conditionings involve a transfer of emotional values to activities such as religion, hobbies, different occupations and with an appreciation on the part of the patient, after a period of twelve months, that alcohol is unnecessary.

Advocates of the emotional or psychogenic cause recognize alcoholism as a symptom of some difficulty of the whole person, which in itself constitutes an interaction between the individual and his physical and cultural environment and circumstances. An appreciative understanding of these difficulties on the part of the patient, made possible through modern psychiatric techniques, helps to bring about a more satisfactory reintegration of his personality. This method of treatment has proven of great value in selected cases, but it is difficult and time-consuming and not economically applicable to a large institutional population. Further experiments in the application of this approach in terms of group therapy may offer a more practical technique for its wider employment.

There is insufficient knowledge of the social, cultural, and environmental origin of chronic alcoholism. It is known that some neighbourhoods have an unduly high incidence of drunkenness. Its treatment or amelioration in this respect awaits further knowledge. Public policies for the correction of chronic drunkenness may embrace such factors in community supervision as techniques of court procedure; custodial and treatment facilities, the latter implying all forms of treatment, including disposition; financial assistance and job placement for the individual; and the enactment of legislative control measures wherein the sale of alcohol, with its moralist, profit, and revenue motivation, would no longer obscure its medical, sociological and economic significance.

The publication of Widmark's work in Sweden in 1922, dealing with a method for determining the alcohol concentration in the blood in "acutely drunk" persons, attracted attention as a diagnostic measure for acute intoxication. Its use, however, for determining the degree of intoxication leaves much to be desired in terms of standardization. Further studies are necessary before it can be accepted as a standardized procedure in the forensic field. The odour of alcohol on the breath, disordered articulation, and inco-ordinated gait continue the commonly accepted but unsatisfactory criteria of acute intoxication. The use of caffeine in the form of strong coffee, long considered desirable as a measure to sober "acute intoxication" is found to have little immediate influence on the alcohol content of the blood. It is not a remote possibility to anticipate that some form of medication may be found that will hasten the metabolism, degradation, or chemical destruction of alcohol within the body of an acutely intoxicated person. At present, however, stimulation of respiration, since alcohol is eliminated in part through the lungs, helps to reduce gradually the concentration of alcohol within the blood.

(W. L. T.)

**Inventions:** see PATENTS.

## Investment Trusts.

The first severe test, since 1932, of the ability to maintain their asset values was imposed on investment trusts by the securities market decline in 1937. For most investment trusts in the United States and Canada the shrinkage in the value of their holdings was heavy because of the stock market slump. In the United Kingdom losses were lower. These three countries represent the predominant development and use of this form of financial institution.

About 1,500,000 persons hold investment trust securities in the United States. Since the beginning of the investment trust movement in the U.S. in the early '20s, 1,077 investment trusts have been organized. There are now about 700, of which 495 are of the management type, including the mutual form of organization, and 178 of the fixed or semi-fixed type. About 58 are special or miscellaneous types. The U.S. Securities and Exchange Commission (SEC) concluded in 1937 an investigation as a basis

for a report to be made to Congress in 1938, looking to possible regulatory legislation. The SEC found that up to the close of 1935 the public had invested \$6,500,000,000 in investment trust securities, with a resultant loss of almost \$3,000,000,000, chiefly following the depression of 1929. The management type was popular until after 1929; then the fixed type, in which holdings are restricted to certain classes or types of securities. The severity of the business depression in 1932 resulted in losses to this type of investment company. Since 1933 the management type has been again in favour, and in 1936 the Federal Government granted taxation advantages favouring the mutual form of management company, which distributes at least 90% of its income and does not reinvest profits as do non-mutualized types.

Up to March, 1937, when the securities markets turned downward, most investment trusts showed substantial increases in their asset values. Drastic change, however, came with the sharp market break in August and the subsequent recession. As an example of the decline in investment trust assets which followed, L. Tomlinson, writing in the financial magazine, *Barron's*, stated that 17 mutual companies suffered a decline in asset values ranging from 30.5 to 40% between December 31, 1936, and December 31, 1937. Apparently a large number of investment companies suffered assets declines about the same as the market averages. Some companies sold holdings on market rallies and one important group entered the new year with each having 20 to 45% of assets in cash or short-term government bonds and gold mining stocks. An enormous fund has thus been accumulated both in investment companies and in investment counselor services, of which there are about 400 in the U.S., awaiting re-investment in securities.

**Great Britain.**—There are more than 200 investment trusts in the United Kingdom, divided among English, Scottish and unit types. They control investments valued at slightly more than £350,000,000 and have a total capital issue of £315/320 millions. *The Economist* asserts that the net profits of 205 companies whose reports were issued in 1937 were £8,976,677 to £10,310,389, an advance of 15%. Although 1937 was a relatively good year for earnings the decline in the securities markets resulted in a loss of asset values in portfolios. Thus, three trusts, which issued reports November 30, 1937, showed a depreciation in their investments of 14%, 15½% and 28.4%. (S. O. R.)

**Iodine.** Chile, formerly the producer of almost the entire world supply of iodine (a by-product in the treatment of caliche for the recovery of sodium nitrate), now has active competition in the market from the United States and Japan, and small amounts for local consumption are produced in Italy. The Italian output is of the order of 25–30 metric tons annually; that of the United States was 102 tons in 1936, declining from 182 tons in 1933; no recent figures are available from Japan, but the amounts are presumably still less than in the United States. Chile is still the main source of supply, with an output that ranged from 500 to 1,000 tons before active competition began in other countries; no recent figures are available. Outside competition had broken the monopoly price from about \$4 per pound, to 81¢ late in 1936. (G. A. Ro.)

**Iowa,** north-central State of the United States, popularly known as the "Hawkeye State"; area 56,147 sq.mi.; population (U.S. census, 1930) 2,470,939; (estimate Jan. 1, 1938) 2,588,504. Capital, Des Moines, 142,559, the only city in Iowa with a population over 100,000. Of the State's population in 1930, 979,292 were urban or 39.6%; 2,448,382 whites; 22,557 coloured; 2,282,647 native born whites; 165,735 foreign born whites.

**History.**—The officers elected in November, 1936, who took office in January, 1937 were: governor, Nelson G. Kraschel;

lieutenant governor, John K. Valentine; auditor, C. W. Storms; treasurer, Leo J. Wegman; secretary of State, Robert E. O'Brien; secretary of agriculture, Thomas L. Curran; attorney general,

NELSON G. KRASCHEL, governor of Iowa

John H. Mitchell. A State conservation commission, a board of social welfare, a State commerce commission, a State planning board, and an Iowa unemployment compensation commission were created or reorganized by the General Assembly in 1937. The State highway commission is located at Ames, Iowa; all the other boards and commissions have their headquarters at Des Moines. By the

close of 1937 there were 4,818 mi. of paving on the primary roads of Iowa and 3,460 mi. of graveled or surfaced roads. Highway construction on primary roads cost \$14,469,530.

The General Assembly of Iowa was in session from Jan. 11 to April 27, 1937. Among its important enactments was the complete revision of the motor vehicle code. The State highway patrol was increased from 50 to 103 men. Provision was made for unemployment compensation, child welfare, old age assistance, and the administration of social welfare. The tax laws were amended to provide a limited exemption for homesteads. The law concerning conservation was entirely rewritten.

**Education.**—There were, for the school year 1936–37, 9,000 rural schools in Iowa, 1,442 graded schools, and 928 approved high schools. The total number of children of school age (5–21 years) was 706,340. Of these 528,764 were enrolled in the public schools and 1,974 in public junior colleges. The teachers in the public schools, exclusive of junior colleges, numbered 27,097; and the cost of the public schools for the year was \$44,786,991. The total attendance at the three State-supported institutions of higher education (the State university at Iowa City, the State College of Agriculture and Mechanic Arts at Ames, and the State Teachers college at Cedar Falls) was 19,431. There are also some twenty privately supported colleges in the State. Iowa ranks first among the States in literacy with only .8 of 1% of the people illiterate.

**Charities.**—A State department of social welfare was established in 1937, headed by a State board of social welfare, composed of five members appointed by the governor. This board is to administer old age assistance, aid to the blind, aid to dependent children, child welfare, and emergency relief. Working with it are the local boards in the 99 counties. The per capita tax for old age assistance was dropped and funds for this purpose are taken from the general taxes. An unemployment compensation commission was also established to supervise the administration of unemployment insurance and compensation.

The board of Control (Harry C. White, Chairman) has charge of the State's penal, correctional, and eleemosynary institutions. Statistics for these as of Dec. 1937, are as follows: Men's Reformatory, Anamosa, 1,104; State Penitentiary, Fort Madison, 1,476; Women's Reformatory, Rockwell City, 82; Training School for Boys, Eldora, 613; Training School for Girls, Mitchellville, 192; and State Juvenile Home, Toledo, 299.

**Banking and Finance.**—There were 114 national banks, 304 savings banks, 237 State banks, and 4 trust companies doing business in Iowa in 1937. On June 30, 1937, the State institutions had total deposits of \$383,193,883, an increase of \$3,480,836 over

those of the previous year, and the deposits in the national banks totalled \$584,339,000. Of the total bank deposits, \$616,068,000 were covered by government insurance. Farm prices increased 8.1% over those of 1936, banks debits were 2.2% larger, business building contracts were 16.4% larger, and residence building increased 14.8%. Public building, however, decreased 6.1%. Sales tax returns were 6.5% larger in 1937 than in 1936, indicating that Iowans spent \$780,000,000 for retail merchandise, \$47,500,000 more than in 1936. Life insurance sales in 1937 exceeded those of 1936 by 10%.

**Agriculture.**—There were 212,376 farms in Iowa in 1937 with 4,323,578 ac. of land. Slightly more than 58% of this land was farmed by tenants. Crops in Iowa were unusually good in 1937. The following figures indicate the production and value of the principal crops in 1937:

	Acres	Total Production	Total Value
Corn . . . . .	11,189,000	503,505,000 bu.	\$211,472,000
Oats . . . . .	5,755,000	258,975,000 bu.	62,154,000
Hay . . . . .	3,033,000	4,372,000 tons	34,102,000
Wheat . . . . .	866,000	15,976,000 bu.	12,940,000
Barley . . . . .	370,000	11,840,000 bu.	5,683,000
Potatoes . . . . .	60,000	5,040,000 bu.	3,125,000
Soybeans (for beans) . . . . .	229,000	4,236,000 bu.	3,388,000
Soybeans (for hay) . . . . .	510,000	714,000 tons	.....

The corn crop in 1937 was almost three times as large as the 173,523,578 bu. raised in 1936. The valuation of the crop in 1936, however, was \$178,193,173. On Jan. 1, 1937, there were 4,870,175 pigs on Iowa farms, 1,018,159 sheep, 3,847,354 cattle, 789,732 horses, and 51,520 mules. During 1937 Iowa farmers marketed \$500,000 hogs, 1,565,000 cattle, 356,000 calves, and 1,280,000 sheep.

The total cash income of Iowa farmers in 1937 was \$522,356,000 as against \$569,000,000 in 1936, and \$528,495,000 in 1935. Of the 1937 total, approximately \$418,000,000 came from live stock, \$79,000,000 from crops, and \$25,000,000 from government payments for soil conservation. On Jan. 1, 1937, 193,241 automobiles and 18,766 auto trucks were owned on Iowa farms. Farm-owned radios numbered 128,073, approximately 60.3% of the farms being so equipped, and 83,656 tractors were in use.

Iowa ranks first among the States of the Union in the production and value of corn (including popcorn), hogs, oats, horses, poultry, and eggs. It ranks first also in the valuation of farm lands and buildings and farm implements and in the number of farm-owned telephones and automobiles. (B. F. S.)

**Iowa, State University of.** The State University of Iowa in 1937 observed its twentieth year by taking some of its longest forward strides.

Established by act of Iowa's first general assembly Feb. 25, 1847, it was the first State university to admit women on equal standing with men. It is located in Iowa City, a community of 6,000 persons 55 mi. west of the Mississippi river.

Enrolment for the year ending in June 1937 totalled 10,756, breaking the old record made during the previous 12 months. Award of degrees totalled 1,524, of which 872 were advanced degrees.

The major building expansion was the completion of a \$65,000 anatomy laboratory and the construction of an \$8,000 pharmaceutical laboratory. A dormitory, to cost \$325,000 and to accommodate 200 men, was started.

A faculty of 525 persons gave instruction in the nine colleges and five schools. Changes in staff personnel occurred in greater numbers than usual.

Grants for scientific research amounted to about \$35,000, of

which about \$22,000 was for work in medical fields.

Some of the important research projects concerned the physiology of sex and of the normal cell, work on blood clotting, studies of plumbing systems to remedy water pollution, and research into the intelligence of children.

**Iran,** known before March 1935 as Persia, a country of western Asia bounded to the east by India and Afghanistan, to the north by the U.S.S.R., to the west by Iraq and Turkey, and to the south-west and south by the Persian gulf and Arabian sea; ruled since 1926 as a constitutional kingdom by Reza Shah Pahlevi (b. 1878). Area, about 628,000 square miles. Estimated population, c. 15,000,000, some 2 to 3 millions being nomadic. The majority are Shiah Mohammedans, but there are some 50,000 Armenians and a smaller number of Nestorian Christians, about 45,000 Jews, and a number of Bahaists and adherents of other faiths. Education, formerly almost entirely in the hands of the religious organizations, is being rapidly developed; the number of schools is said to have increased sixfold in ten years. The largest city is Teheran, the capital, with over 360,000 inhabitants; it is followed by Tabriz (220,000), Meshed (140,000), Shiraz (120,000), and Isfahan (100,000). There were no constitutional developments or important events in 1937, but the country's general progress and modernization was continued. In July, a mutual non-aggression pact was signed at Saadabad with Iraq, Turkey, and Afghanistan, an agreement having been signed with Iraq a few days previously settling the long-standing frontier dispute as to the navigation of the Shatt-el-Arab.

Agriculture is not of great importance, in view of the desert nature of much of the country; there are mineral resources of value, not yet extensively worked, save for the oil-fields in the south. Manufactures, save for carpets, are few, though there is some development of the textile industry, especially cotton. Railways and roads are being rapidly constructed: there are about 600 mi. of the former.

The unit of currency is the rial, of 100 dinars: the gold standard is suspended, and the silver rial—nominal value 2.4d—exchanges at 80 to the pound sterling. The 1937-38 revenue is estimated at £15,625,000 and £15,600,000 respectively. Revenue arises mainly from customs duties, oil royalties, State monopolies, and land taxes. Foreign trade is (since 1931) a State monopoly: exports in 1936 were valued at c. £24 millions, imports at c. £13 millions. Besides several other banks, there is a national bank, the Banque Mellié Iran, with the sole right of note issue, which was formerly held by the British-owned Imperial bank of Iran. The standing army, about 100,000, is well equipped, and a small fleet operates on the Persian gulf.

CRUDE PETROLEUM PRODUCED in Iran

**Iraq**, an Arab State of the Near East, between Persia, Syria, and Arabia, watered by the Tigris and Euphrates; an independent kingdom since 1932, when the British mandate was terminated. Ruler, Ghazi I (b. 1912; succeeded 1933). Area, c. 116,500 square miles. Population (estimate, 1932) 2,856,000. Baghdad, the capital, has about 261,000 inhabitants; other large towns are Mosul (c. 100,000) and Basra (c. 53,000). The people are almost entirely Mohammedans, the Shiah somewhat outnumbering the Sunnis; disputes between the two sects are frequent. There are over 100,000 Christians, and about 75,000 Jews. Arabic is the official and general language.

**History.**—In Jan. 1937, Seyyid Hikmet Sulaiman, premier since the coup d'état of Oct. 1936, began a campaign for army reorganization, extending the Conscription Law to the Yezidis. Towards the end of February rumours arose that a revolutionary movement against the Government of Baqir Sidqi and Hikmet Sulaiman was afoot, and arrests were made among the Baghdad garrison. The cabinet was reorganized in June, four ministers resigning on the ground of disapproval of army methods; and on Aug. 12 General Baqir Sidqi, Chief of Staff, together with the head of the air force, was assassinated at Mosul aerodrome by an Iraqi soldier. On the 16th the premier resigned, and a new moderate cabinet was formed by Seyyid Gamil al Madfai, who had been premier three times previously, the new premier taking also the Defence portfolio. The Iraqi Government was party to the non-aggression treaty of Saadabad (*see* ISLAM). A public works loan for £1,000,000 was issued in London in July. After the publication of the plan for the partition of Palestine, the Government protested against that policy in a note to the League of Nations dated July 30, upholding the idea of an independent, undivided, and Arab Palestine.

**Agriculture.**—Agriculture is extensively carried on, wheat, barley, rice, and dates being the principal crops; oil is the chief mineral product, and wool is produced for export. Manufactures are not much developed. There are some 900 mi. of railway, and roads are being opened up over most of the country, about 5,000 mi. having been constructed since 1918. The excellent airport at Baghdad is served by Imperial Airways, K.L.M., and other lines.

**Banking and Finance.**—The standard of currency is the dinar, equivalent to the pound sterling. Revenue and expenditure in 1936–37 amounted to £5,985,000 and £6,140,000 respectively; imports were valued at about £7,200,000 and exports at £3,484,000. An Agricultural and Industrial bank under Government auspices exists; the Ottoman bank and other eastern banks also operate. The British air force has stations in the country; the Iraqi air force and army combined have a strength of 20,500, and compulsory service is in force. The country is policed by about 9,000 officers and men.

**Education.**—There is as yet no university; over 600 primary schools have some 90,000 pupils, and there are 28 intermediate and 12 secondary, technical, and special schools.

**Ireland, Northern.** Northern Ireland comprises the six Ulster counties of Antrim, Armagh, Down, Fermanagh, Londonderry, and Tyrone, forms part of the United Kingdom of Great Britain, but (since 1920) has its own parliament and executive, though also represented in the Imperial Parliament by 13 members. Capital, Belfast. Ruler and national flag, as for Great Britain.

**Area and Population.**—Area: 5,237 sq. mi. Population (1937): 1,279,177 (density 246 per sq. mi.). The largest cities are Belfast (pop. 437,824) and Londonderry (pop. 47,857).

**History.**—There were no constitutional changes or by-elections. Changes in the ministry were caused by the death in April of the

Rt. Hon. J. W. Pollock, minister of finance; he was succeeded by the Rt. Hon. J. M. Andrews, minister of labour, whose place was filled by Major D. Graham Shillington, Unionist member for Armagh Central. In December Mr. J. H. Robb replaced Viscount Charlemont as minister of education, and Mrs. Debra Parker, member for South Londonderry, became parliamentary secretary to the ministry of education and the first woman to hold Government office in Northern Ireland. A law reform act was passed assimilating the status of married women to that recently attained in Great Britain, making better provision for compensating victims of accidents, etc. A census was taken on Feb. 28. In July King George VI visited Belfast, his welcome being marred by outrages on the Free State frontier, including the burning of customs posts. In September work was commenced at Belfast on a new airport on a site of 365 acres reclaimed by the harbour commissioners.

**Trade and Communications.**—The principal industry is agriculture; there are over 900,000 acres under crops, in about 95,000 holdings. Shipbuilding (1936 output, 62,525 tons) and the linen industry follow, both centred in Belfast. The total volume of external trade in 1935 was £92,000,000. There are some 750 miles of railway and 13,000 of roads. A road transport board (formed 1935) has assumed the management of goods and passenger transport.

**Finance and Banking.**—There is no special local currency; the monetary system is that of Great Britain. For the financial year ended March 1937 the total budgetary revenue was £11,596,818; the corresponding expenditure £11,541,868, showing a surplus of £54,000. The budget estimates for 1937–38 balance at £14,684,000, allowing for contributions to Imperial funds. Taxation is mainly collected by the Imperial Government, which, after making certain deductions, hands over the balance to the local exchequer. The banking system resembles that of Great Britain; on Dec. 31, 1936, the three principal local banks held deposits of £49,857,000.

**Education.**—Education is conducted under the Northern Ireland ministry of education in a manner similar to that obtaining in the rest of Great Britain. Latest statistics report 1,753 elementary schools (200,607 pupils), 73 grant-aided secondary schools (13,165 pupils), 124 centres for technical instruction (23,218 students), and the Queen's University of Belfast, with 144 professors, lecturers, etc., and nearly 1,600 students.

**Religion.**—There is no established church. About 33.75% of the population is Roman Catholic; 31.4% Presbyterian, and 27% Protestant Episcopalians.

**Defence.**—Northern Ireland has no separate defence forces. It is policed by the Royal Ulster constabulary (maximum strength 3,000), and a part-time special constabulary. (*See also* GREAT BRITAIN AND NORTHERN IRELAND, UNITED KINGDOM OF.)

**Irish Free State.** Under the constitution, operative since Dec. 29, 1937, the name "Irish Free State," given by the Treaty of 1921 to the 26 counties of Southern Ireland, is to be replaced by that of "Eire," or Ireland. The territory remains unchanged. Capital, Dublin. Ruler, a president (*uachtarán*), to be elected by universal suffrage and to hold office for seven years. National flag, the tricolour of green, white, and orange.

**Area and Population.**—Area: 26,592 square miles. Population (1936): 2,965,854, a decline of 4.8% since 1926. On the other hand, the population of towns with over 10,000 inhabitants has increased by 9.3%. The estimated emigration for 1937, mainly to Great Britain, is about 40,000. Roman Catholics numbered (1926) 2,751,000; Protestant Episcopalians 164,000; Presbyterians 32,000; Methodists 11,000; Jews 4,000; total non-Catholics 221,000.

1926, the total of native Irish speakers was 544,000, a decline of 10,000 since 1911. Irish (Gaelic) is compulsory in all schools and is increasingly used as a medium of instruction. The leading cities are Dublin, pop. 472,000; Cork, 80,713; Limerick, 41,385; and Laoghaire (Kingstown), 39,762; Waterford, 27,962; Galway, 28,285. By the Local Government (Galway) Act, 1937, Galway came once more a municipality, with mayor and corporation.

**History.**—The titles "executive council" and "minister" are now abolished, and those of "president" and "vice-president" replaced by *taoiseach* and *tánaiste*. Taoiseach and minister for External Affairs: E. de Valera; *tánaiste* and minister for Local Government: S. T. O'Kelly; members of Government: P. J. Keating (justice), S. MacEntee (finance), F. Aiken (defence), E. Ryan (agriculture), S. Lemass (industry and commerce), T. W. Merrig (education), G. Boland (lands), O. Traynor (posts and telegraphs).

The constitution of Eire was approved by plebiscite, July 1, 1937. Voting: for, 685,105; against, 526,945. In many respects it re-enacts the Free State Constitution of 1922, the principal changes being: the institution of a president as head of the State, and the restoration of a senate of 60 members, 11 nominated by the *taoiseach*, 6 elected by university graduates, and 43 from electoral panels by a joint electorate made up of the Dáil and an elected number of county councillors. There is to be a Council of State with advisory functions. No mention is made of the Treaty of 1921 nor of the King. Article 29 empowers the Government to use for certain external purposes the organs of those states with which Eire is for the time being associated.

The general election, held also on July 1, 1937, gave 69 seats to Fianna Fáil, 48 to Fine Gael, 13 to Labour, and eight to Independents. This left Fianna Fáil in a minority of one, but they retain the support of Labour on most questions. The most important legislation of 1937 was the new constitution. An act to provide widows' and orphans' pensions was passed. It was announced that ministers were now accepting the salaries fixed by the previous Government, and the whole question of their emoluments was submitted to a committee. Following the abdication of King Edward VIII, the Executive Authority (External Relations) Act, 1936, now embodied in article 29 of the constitution, was passed. The Free State was not represented at the Imperial Conference, 1937. In Jan. 1938, Irish and British representatives met in London to examine all outstanding differences.

**Trade and Communications.**—Agricultural exports to Great Britain, 1937, were £17,430,017. The area under tillage was 999,100 acres. Cattle numbered 3,963,900; sheep, 2,988,300; pigs, 956,000; all showing considerable decreases from 1936. In 1937 a minimum wage (24s. a week) was fixed for agricultural labourers, and control boards were set up for cereal crops and livestock. The year 1937 saw record progress in Irish manufactures. Apart from many new factories, there were established industrial alcohol plants, an oil refining company, and cement works. The value of Ireland's industrial output has increased by 60% since 1932.

Imports (Dec. 1936–Dec. 1937), £44,126,363. Exports, £22,241,292. Increase in adverse balance, £3,870,558. The most important event of 1937 was the series of transatlantic flights from Foynes to Newfoundland. An Irish company has been formed to co-operate with Imperial and Pan-American Airways. Broadcasting is controlled by the Department of Post and Telegraphs. Early in 1937 the number of licences passed was 1,000. A short-wave station is being built at Athlone.

**Finance and Banking.**—Estimated revenue for 1937–38: £18,841,000. This includes £3,760,000 to be borrowed. There has been an increase in expenditure since 1931–32 of £7,500,000. Tax

revenue, 1936–37: £25,287,000. Income tax, £4,738,000. Customs, £10,016,000. Land annuities withheld from Great Britain accounted for £1,325,000.

Banking is regulated by the Currency Act, 1927, under which currency is "pegged" to sterling. Six banks issued fiduciary notes for £5,028,764 from Sept. 1936 to Sept. 1937. Currency notes reached the record figure of £8,953,657.

**Education.**—Primary education is compulsory to the age of 14. Schools are under episcopal management, but the State controls programs and pays teachers. Secondary education is voluntary, mainly given by diocesan schools and religious orders, with State-conducted examinations. Since the Vocational Education Act (1930), great progress has been made in technical education. The universities are: Trinity college (University of Dublin), and the National University of Ireland, with three constituent colleges at Dublin, Cork, and Galway, and a recognised college for clergy at Maynooth.

**Defence.**—Regular army: 5,751. Reserve: 5,563. Volunteer force: 9,810. There is no navy, and a very small air force. The police (*gárda síochána*) number 7,646.

**BIBLIOGRAPHY.**—E. Curtis, *History of Ireland* (1936); *Irish Free State Official Handbook* (1932); Dublin Stationery Office Publications. (M. T.)

**Iron and Steel.** Discussion of the iron and steel industry can for the most part be handled more satisfactorily subdivided into its three main headings—iron ore, pig iron, and steel. The production tables found below under each of these headings include all countries in which production of the commodity in question has exceeded 1,000,000 tons. This coverage in general accounts for 93–98% of the totals. In all three the greater extent to which the depression has affected the United States industry, in comparison with that of the rest of the world is clearly evident, in the much smaller output in the low year, and the lesser extent to which recovery had attained in 1936; while declines ranged from 76% to 87% in the United States, and recoveries reached 67–85%, the corresponding declines for the rest of the world were 41–49%, with recoveries to 96–123% of 1929. Iron ore suffered the worst and recovered the

STEEL MILLS of the United States Steel Corporation at Gary, Indiana

least, while steel declined the least and recovered the most, with pig iron intermediate between these two; this was true of both the United States and the ex-U.S.A. figures.

A point of considerable technical interest is the ratio of production between pig iron and steel. In 1900 this was 100:73, gradually changing on the one side with the decline of uses for pig iron other than steel manufacture (particularly the decline in the use of iron castings), and on the other side with the growth of the practice of utilizing more and more scrap in the production of steel, thus increasing the output of steel without affecting that of pig iron. The two reached a balance about 1915, and stood at 100:122 in 1929 and 100:135 in 1936; in 1937 the ratio dropped to 100:130, probably because of shortage of scrap to maintain the former rate of increase.

Incidentally, attention might be called to the fact that the preliminary estimates for the outputs of pig iron and steel for 1937, given in the tables, are American estimates; European estimates are somewhat higher for both, but it is still too early to determine which is the more nearly correct.

**Iron Ore.**—World production of iron ore decreased 64% from the 1929 high to the 1932 low, and recovered to 85% of the 1929 level in 1936. Three countries, the United States, France and the Soviet Union, contribute nearly two-thirds of the total, while the other two of the leading iron and steel producers, the United Kingdom and Germany, add another 10%.

By the end of 1936 the United States had recovered to only 67%

STEEL INGOT PRODUCTION in the United States: percentage of capacity.

ELECTRIC FURNACE being tilted to pour ten tons of molten steel into ladle, which distributes the metal to ingot moulds

of the 1929 high, but preliminary reports for 1937 promise closing of the gap when the final figures for the year become available. French production is still well below the former high but the United Kingdom and Germany have shown better recovery, and there are in the Soviet Union heavy increases.

Exports of iron ore from the United States are small, being the order of 1% of production; imports are somewhat larger and average about 5% of production, about one-half of which comes from Chile, and one-fifth from Cuba. The Russian industry is even more nearly self-contained than that of the United States. Germany produces only about one-quarter of her requirements, and imports three-quarters, while the United Kingdom produces about two-thirds and imports one-third. Sweden exports almost her entire output, mainly to Germany, and about one-ha-

the French output is exported to Belgium and Germany. **Pig Iron.**—World production of pig iron dropped 60% between 1929 and 1932, recovering to slightly better than the 1929 level in 1937. Three of the five leading nations, the United States, Germany and the Soviet Union, account for two-thirds of total output, and the United Kingdom and France for another 15%. Of these only the Soviet Union has shown a marked increase over 1929; Germany stands at about par, while the others are all low. The apparent increase in Germany and much of the decrease in France is explained by the transfer in 1935 of the Saar from the jurisdiction of France to that of Germany. Exports of pig iron from the United States are almost non-existent, and imports are negligibly small. Russian imports are apparently small, and exports take about 5% of the output. In Germany and France imports average about 1% and exports about 2% of production, while the United Kingdom imports are about 2% and exports 2%. In all cases the amounts are so small as to be of little practical importance. In some cases, however, considerable amounts of scrap metal are imported, to take the place of pig iron in the production of steel.

**Steel.**—A decline of 58% in the world steel production between 1929 and 1932 was canceled in 1936, when an output of 122,600,000 long tons set a new high record, which in turn was replaced by another record output of 132,500,000 tons in 1937, an increase of 8% over 1936, and of 11% over 1929. Of the five

leading producers, the United States and France have not yet regained the 1929 level, while the Soviet Union, the United Kingdom and Germany have surpassed it. It may be noted, however, that as with pig iron, much of the apparent German increase and of the French decrease are due to the transfer of the Saar in 1935 from France to Germany. Of the smaller producers listed in the table, every one has surpassed the 1929 level of production, or has approached it very closely.

The United States steel industry is practically independent of imports, and exports amount to only about 7% of the production. Among the European producers international trade plays a much larger part in the industry, except for the Soviet Union, in which exports are small, and imports run about 4%. The United Kingdom has steel imports of about 12% and exports of 19% of production, leaving a net export of 7%. Germany imports 3% and exports 19%, or a net export of 16%. France imports 2% and exports 33%, making a net export of 31%. The Economic Union of Belgium and Luxemburg are still heavier exporters, sending out 44% of the combined output. Incidentally, these European percentages, though still fairly large, have been decreased by about one-half during the past decade by export and import restrictions and embargos that have been put into effect

in these and other countries to which exports were formerly made. (See also FLUORSPAR; METALLURGY.) (G. A. Ro.)

**Iron and Steel Institute, American:** see AMERICAN IRON AND STEEL INSTITUTE.

**Iron Lung.** For some time there have been available artificial respirators or so-called iron lungs which incase the entire body and which cause the human being whose muscles and nerves of respiration have been paralyzed to breathe by variations in the pressure of the atmosphere around the body. Previous devices have been known as the Drinker and the Emerson respirator. The new type of respirator incases only part of the body, and was brought to public attention during 1937. The Sahlin respirator is recommended for protracted mechanical ventilation of the lungs in treating respiratory paralysis. Dr. B. Sahlin, working at the Physiologic Institute in Lund, Sweden, constructed this respirator.

Respirators imitate natural respiration by rhythmic alterations of the thoracic volume, producing artificial respiration. In other apparatus on the market, the entire body of the patient, except for head and neck, is placed inside a close compartment. The Sahlin device encloses only the thorax and abdomen, leaving head, neck, arms and perineal region easy of access for general

ALUMINIUM AND RUBBER RESPIRATOR for manipulating the lungs of paralyzed persons and to replace the barrel-like "iron lung" which imprisoned the entire person

or special nursing care. This, as well as other types, operates by first creating a slight negative pressure inside the closed compartment, thus increasing the thoracic volume. Then the outside air rushes into the patient's lungs which is now a low pressure area. As the pressure inside the respirator returns to normal, the chest wall retracts, accompanied by expiration.

The Sahlin respirator consists of a hood with framework of inflexible sheet-metal (available in three sizes to fit different sized individuals) mounted on an operating table movable in all directions. Special locking arrangements enable the hood to be fitted to the patient and removed quickly. The hood is fitted closely to the surface of the body by rubber material. A large tube (like a vacuum cleaner hose in appearance) connects the hood to the electric machine supplying the mechanical alterations of pressure both positive and negative. The respiratory rate and variations of pressure are said to be readily adjustable.

There are two objections to this device. In the first place, once the patient is placed under the hood, he is held immovably to the table. The table itself may be adjusted to a limited extent in order to shift the patient's weight. In spite of this, pressure sores are apt to occur where the apparatus is used for extended periods. In addition, and this objection also holds true for the other type of respirator, the parts that touch the patient's skin rub against it at each respiratory movement. (See also *MEDICINE: New Materials and Apparatus*.)

(M. FL.)

**Irrigation.** Throughout the western United States where irrigation is extensively practiced the precipitation of 1937 was generally more abundant than that of the preceding six years. This was sufficient not only to supply current irrigation requirements but also to replenish in part depleted reservoir storage. The water shortages experienced during the dry years stimulated the investigation of the possibilities of the more effective conservation and utilization of the water resources of the arid region. Acute water shortage conditions along the Rio Grande in New Mexico and West Texas called for a detailed and comprehensive investigation of the upper basin of that stream during 1936 and 1937 under the auspices of the National Resources committee and the States of Colorado, New Mexico and Texas. Similarly, water shortages in eastern Colorado led to an exploration of the possibilities of the transmountain diversion of water from the upper tributaries of the Colorado on the western slope of the Rocky Mountains to supplement the limited supplies in the upper tributaries of the South Platte and the Rio Grande.

Among the trends that were notable during 1937 the following may be mentioned: (1) a substantial extension of the work of making seasonal surveys of snow conditions in the mountain areas

drained by irrigation streams as a basis of forecasting prospective stream flow; (2) progress in diverting and spreading the flood waters of mountain streams to replenish the ground waters of alluvial valleys, which waters are extensively used for irrigation by means of deep wells; (3) the extensive migration of families to irrigated lands from dry farmed areas in which drought conditions were severe during 1934 and 1936; (4) the progressive development of additional land in established irrigated districts through the more efficient use of available water supplies and the re-use of waters hitherto wasted as drainage from irrigated lands; and (5) in connection with this last there was increasing attention given to the quality of irrigation and drainage waters in relation to the effects of their dissolved salts on the productivity of irrigated lands.

While no new large irrigation project was completed or opened to settlement during 1937, progress was made on large irrigation works such as the Imperial dam with canals to the Imperial valley in California and the proposed Yuma-Gila project in Arizona; the Central valley project in California; the Grand Coulee dam on the Columbia river in Washington; and the Kendrick (Casper-Alcova) project in Wyoming. Because of adverse economic conditions, there was little construction on non-Federal projects during the year; but some work was done in recon-  
ditioning existing distribution systems and in extending and improving drainage facilities on such projects. It is estimated that the aggregate area of irrigated land in the western United States is somewhat in excess of eighteen million acres. This acreage has not changed materially for several years, because such additions as have been made by new construction or extensions have been offset by losses due to water shortages or to increasing salinity in older areas.

(C. S. S.)

**Great Britain.**—In so far as "irrigation" includes its obverse land drainage and flood protection, great advances are made in that direction every year as a result of the Land Drainage Act of 1930. The Fenland floods are being brought under control by improvements in individual rivers tending to strengthen their defences against floods and tides. Such schemes are often combined with improvements to navigation, as is exemplified by the works now in progress on the river Lea and the recently completed "Dog-in-a-Doublet" lock on the river Nene, near Peterborough. On the river Severn, 5½ mi. of the channel are being widened, while, to facilitate the discharge of flood waters, many old weirs and sluices are being remodelled or replaced.

**Australia.**—The effects of denudation on the upper reaches of the Murray river have materially altered its régime, its discharge during the six winter months being now three times as much as during the summer months, whereas formerly it used to be practically uniform throughout the year. Consequently, in summer the small lakes, Alexandrina and Albert, at the river's mouth, become salt, thus damaging the irrigation, the grazing, and the potable water supplies round their shores. Five simple barrages are therefore being built to exclude the salt water, at an estimated cost of £545,000.

The water conservation and irrigation commission of New South Wales is establishing various irrigation schemes, having at its disposal the 300,000 ac.-ft. of water stored by the Wyangala dam on the Lachlan river, that was completed in 1935.

**India.**—Over 50 million acres are irrigated under various systems, and hence research is actively carried on. The following methods of lining canals to prevent seepage losses have been found unsatisfactory, as the cost is heavy in relation to life: clay puddling, cement slurry, cement mortar, concrete slabs, oiled paper, and bituminous material. A chemical method under trial, which promises well, adds sodium carbonate to soils containing available calcium, thus turning the permeable calcium clays into

impermeable sodium clays, which easily become puddled.

Work has begun on the Haveli irrigation project, which is to provide perennial irrigation for 700,000ac. and non-perennial for 60,000ac. at a cost of £3,750,000 of which about 40% is taken by a barrage on the Chenab river, below its junction with the Jhelum river. The Thal project, depending on the Indus river, in the Mianwalli district of the Punjab, is approved at a cost of £3 millions.

**New Zealand** is developing irrigation in the South Island by making a canal 34 miles long, taking from the Rangitata river to water land in Ashburton county. The project is estimated to cost £135,000, and will take three years to complete.

**South Africa.**—The Vaal-Hartz rivers project stores Vaal river water some 20 miles south of Johannesburg, which then flows for 360 miles along the Vaal river to be diverted by a barrage into a four-mile long cutting which goes through the watershed of the Hartz river into a canal system in the latter's valley, serving about 100,000 acres. The total cost, estimated at £4 millions, includes £900,000 for the dam, which forms a reservoir holding 100,000ac.-ft., that could be more than doubled at comparatively small additional cost. The dam across the main channel of the Vaal river is concrete (length 1,700ft. and greatest height 160ft.), while an earth-bank closes a side branch. The latter has no impermeable core-wall, the head being small, and reliance therefore placed on the length of travel of the water to stop creep.

**Algeria.**—Rock-fill dams have been successfully used, being made watertight either by facing them with an impermeable apron or by including an impermeable core-wall of reinforced concrete. Two such dams have been built in the Province of Oran, one at Sakkhada, 148ft. high, costing 121 million francs (about £800,000), the other at Bou-hanifia, 180ft. high, costing 325 million francs (about £2,200,000).

**China.**—The chief projects lately completed include the Karatsi project in the Suiyuan province, some 450 miles north of Peking, which takes water from the Yellow river to supplement the ordinary rainfall, and three projects completed by the Shensi provincial government on the Wei, King, and Lo rivers, all in the Yellow river system, protecting about 300,000ac. in all. One of these, the Wei Pei project, revives irrigation in a district where the first works of this nature date back to 240 B.C.

**Egypt** has built a reservoir on the White Nile in the Sudan, to be filled with the silt-free water of that river while the main Nile is in flood and Egypt has water to spare. The requisite dam, at Gebel Aulia, about 25 miles south of Khartoum, cost about £2 millions (£E.1 = £1 os. 6d.), not including land compensation (£E.750,000) and some other charges. It is 3 miles 1 furlong long, with maximum height 60ft.; it has 60 sluices, 10 being "blind" for the present, and a lock 60ft. wide. The work is built on a wide base, so that it can easily be heightened by about 9ft. The reservoir is about 200mi. long when full, with an average width of about 2½mi.; it stores about 3,100 million cubic metres of water but, owing to evaporation from the reservoir and seepage losses in transmission down the Nile, only about 2,200 millions reach Egypt, where they will suffice to extend perennial cultivation to about 550,000 feddans (1 feddan = 1¼ acres).

The remodelling of the Assiut barrage, which serves middle Egypt, to hold a head of 14ft. instead of its present 10ft. 8in. was begun in 1934, and will shortly be finished, at a total cost of about £2.1 million.

The Delta barrages, serving lower Egypt, are nearly 100 years old, and are being replaced (the old structures being retained as ad bridges) by two new barrages, to be called the Mohamed Ali barrages, sited a little downstream of the old works. These barrages are near the heads of the Damietta and Rosetta branches of the Nile, about 15mi. north of Cairo; they will have 34 and 46

sluices respectively of 8 metres (26ft. 8in.) width, and each will have a lock. They will be able to maintain a level in summer 2ft. 2in. higher than before, *i.e.*, 16.35 metres above Alexandria mean sea-level. The total cost will be £E.3 millions, including some subsidiary works, and they are to be finished in 1939.

In the Sudan, the area commanded by the Gezira irrigation scheme, depending on the Sennar dam on the Blue Nile, was in 1937 extended by over 31,000ac. to a total of nearly 900,000 acres.

**Iraq.**—The Kut barrage on the river Tigris at Kut-el-Amara is to provide irrigation for about 1¼ million acres by maintaining a maximum head of 5.35 metres. The work is to cost £1,150,000 and is to be finished in 1938.

**Russia.**—The Greater Volga scheme includes the remodelling of the rivers Dnieper, Don, and Svir to produce hydro-electric power on a colossal scale, and also to make possible the eventual irrigation of 87 million acres of semi-arid and waste lands. A portion of this, the Kuibyshev hydro-electric power and irrigation development project, is included in the third five-year plan, and provides for the irrigation of 6¼ million acres in the south Volga area. (*See also DAMS.*) (F. NE.)

**Isherwood, Sir Joseph William** (1870–1937), British ship designer, was best known for developing the system of longitudinal framing now used throughout the world in the construction of cargo vessels and tankers (*q.v. Encyclopædia Britannica*, vol. 20, p. 534). His most recent development was the "arcform" used in building the first streamlined freighter in 1934 for the purpose of reducing the fuel costs necessary because of the wasteful wake of deep-draughted ships. Born June 23, 1870, Sir Joseph was knighted in 1921 and died in London, Oct. 24, 1937.

**Islam**, the religious system founded in the 7th century A.D. by the Arab prophet, Mohammed, now followed by perhaps some 210,000,000 people, mainly in Asia and North and East Africa, though there are some 5,000,000 Mohammedans in Europe (Turkey and the Balkan States) and about 20,000 in North America. About one-half of the Mohammedans throughout the world are subjects of Great Britain, France being, in virtue of her African possessions, the second greatest Mohammedan power; the attainment of sovereign status by Egypt has led to a movement in that country to secure it the acknowledged primacy in the world of Islam, and one party is desirous that the king of Egypt should assume the title of caliph, or "commander of the Faithful," which has been virtually in abeyance since its abolition in Turkey in 1924. The formation of an Italian empire in North and East Africa has made Italy a Mohammedan power of importance, and in recent years she has intensively cultivated Mohammedan friendship both in her own dominions and in Egypt, Arabia, Palestine, and other Islamic lands, in an apparent effort to compete with Great Britain as the friend of Islamic, particularly Arab, aspirations (*see ARABIA*); Mussolini has even hailed himself as "protector of Islam." On July 8, 1937, was signed at Saadabad in Teheran a mutual non-aggression pact between four of the principal Islamic countries—Iraq, Iran, Turkey, and Afghanistan. The world of Islam has been largely moved by the course of events in Palestine (*q.v.*), and the age-long rivalry between Mohammedan Arab and Jew, fanned to a flame by recent events in that country, has helped to foster Italy's schemes for extending her influence.

Pan-Arabism, the movement for giving greater expression to the community of ideals and culture among Arabic-speaking peoples, is rapidly increasing, especially in Iraq, Syria, Palestine, and the adjoining lands, though at present it finds its greatest urge rather in its negative attitude of hostility to Zionism and

to the extension of Jewish influence in Palestine than in any positive scheme of Islamic or Arab federation. Syria is perhaps the strongest centre of the Pan-Arab movement, and in Sept. 1937 a Pan-Arab congress, attended by delegates from all Arab lands except Yemen, met at Bloudan and protested strongly against the proposed partition of Palestine.

After a series of Arab outrages at Nazareth in September, the Government of Palestine found it necessary on Oct. 1 to deprive the grand mufti (*q.v.*) of Jerusalem, the spiritual head of Palestinian Islam, of the presidency of the Muslim council; he took refuge shortly after in Syria. Turkey and Iran, states with independent historical backgrounds, have been affected in very slight degree by the Pan-Arab movement, and the Muslim population of the Lebanon has also tended to remain deaf to Pan-Islamic endearments.

In India, there were fewer Hindu-Muslim clashes than usual during 1937, and in several provinces, after the April elections, Muslims united with Hindus to form ministries.

The Nizam of Hyderabad having provided a large sum towards the provision of a second mosque in London for the use of the Mohammedans in Great Britain, roughly 3,000 in number, the foundation-stone of the building—which will, it is claimed, be on completion a “miniature Taj Mahal”—was laid in Kensington on June 4 by the prince of Berar, in the presence of representatives of Egypt, Turkey, Iran, and other Muslim States.

**Isle of Man,** island in the Irish sea, between Great Britain and Ireland; part of the British Empire, but governed by a local parliament, the Tynwald court, consisting of the governor (appointed by the Crown), a legislative council, and a House of Keys of 24 popularly elected members. Capital, Douglas (pop. 19,329). Ruler and national flag, the same as for Great Britain.

**Area and Population.**—Area: 227 sq.mi. Population (census 1931): 49,308 (density, 21.7 per sq.mi.).

**Religion, Language, Education.**—The island forms an Anglican bishopric, Sodor and Man, attached to the province of York. In 1937 the abolition of this see and the attachment of the island to the diocese of Carlisle was mooted. English is everywhere spoken; 528 persons (1931) also speak Manx, the ancient Celtic language of the island.

Education, elementary and secondary, is undertaken by the Manx Government; in 1936 there were 5,545 elementary and 1,147 higher scholars; expenditure on education (1936–37) was £75,901 (elementary) and £28,455 (higher).

**Industry, Communications.**—About half the island is under crops, mainly corn and grasses; there are about 1,200 agricultural holdings. Entertaining British holiday-makers is the main industry. During 1937 the Calf of Man (south-west extremity of the island) was presented to the National Trust for preservation as a nature reserve. There are 71 miles of railway and electric tramway; two airports (near Castletown and Ramsey), and daily air services to England, Scotland, and Ireland.

**Finances, etc.**—British currency is in use. The revenue and expenditure (1935–36) were £534,148 and £526,671 respectively; the debt is about £580,000. Ten thousand pounds per annum is contributed to the Imperial exchequer. Revenue is raised mainly by customs duties; there is a small income tax. There is a police force of about 70.

## Isotopes of the Lighter Elements,

**Separation of.** The study of the differences in properties of the hydrogen isotopes and their compounds has led to an investigation of similar differences in the

case of the isotopes of other light elements. Aston and Harkins changed the relative abundances of isotopes by diffusion methods, and Hevesy effected similar changes by evaporation. The problem has been attacked in recent years by using three methods.

(1) Hertz has constructed a very ingenious cascade diffusion apparatus which makes use of many diffusion units arranged in such a way that the light fractions are fed from one unit to the preceding one and the heavy fraction from this unit to the following unit. In this way it is possible to increase greatly the effectiveness of the diffusion method as compared with the simple processes used by Harkins and Aston. This method depends upon the differences in the velocity of diffusion of the isotopic constituents because of differences in molecular weights, the velocity of diffusion being inversely proportional to the square root of the molecular weight.

Hertz has used cascades consisting of as many as 50 diffusing units, and two varieties of diffused media, one porous clay tubes and the other moving streams of mercury vapour. The latter appears to be the more easily constructed and more effective method. In this way he and others have succeeded in producing nearly pure neon isotopes of atomic weights 20 and 22, 16%  $C^{13}$  instead of approximately 1%  $C^{13}$  in natural carbon, 3%  $N^{15}$  as compared with 0.38% in the natural nitrogen, but slight concentrations only in the increased concentrations of the rarer oxygen isotopes of masses 18 and 17.

(2) The second method consists in distillation of the pure elements or their compounds. The first successful concentration of isotopes by distillation methods was made by Keesom and van Dijk in the case of neon and by Urey, Brickwedde and Murphy in the case of the hydrogen isotopes. These distillations were carried on at low temperatures and the differences in vapour pressures could be predicted by the use of well-known theories of the solid state. More recently the distillation of water has been used by Urey and Huffman and by Stedman to produce appreciable changes in the ratio of the oxygen isotopes. In this case the differences in vapour pressures are very slight, the ratio of the vapour pressures at 60°C being only approximately 1.006, and it is therefore necessary to use very efficient fractionation columns in order to secure appreciable separation. The heavy oxygen water produced in this case contained about .85% of  $O^{18}$ . The method can undoubtedly be used for the production of much higher concentrations, and with sufficient effort can be used for the preparation of nearly pure  $O^{18}$  water.

Closely related to the distillation method are the chemical exchange methods proposed and developed by Urey and his co-workers. The process in this case is carried out in much the same way as in the case of distillation, making use of efficient fractionation columns. The gaseous phase in the case of nitrogen was ammonia gas and the liquid phase a solution of ammonium sulphate or, in general, ammonium ion. Ammonium sulphate was fed to the top of such a distillation column, ran to the bottom, where sodium hydroxide was added to the ammonium removed from the solution by distillation. The ammonia gas was turned upward through the fractionation column and escaped at the top. In this way there was enough transport of heavy nitrogen down the column, since the percentage of heavy nitrogen in the ammonium sulphate solution is greater by about 2% than the percentage of heavy nitrogen in the ammonia gas rising in the column. In this way 2½%  $N^{15}$  was produced at the bottom. This method has the advantage over the Hertz diffusion method of producing large amounts of material, but requires much longer times for the attainment of the steady states where the maximum concentration is produced. It appears possible in this case also to produce high concentrations of the rarer isotopes with sufficient expenditure of time.

(3) The third method which is coming into use for the separation of isotopes is the centrifugal method originally proposed by Mulliken and developed by Beams. This method is similar in many ways to the distillation and chemical exchange methods except that the fractionation is produced by the centrifugal action. If liquid is placed in a rapidly rotating chamber the ratio of two isotopes at the centre of rotation and at the periphery will differ depending on the speed of rotation, the difference in molecular weights and the temperature, so that if one secures sufficiently high speeds of rotation and can keep the temperature sufficiently low appreciable separation can be secured. At present only slight changes in isotopic composition have been produced by this method, but it appears to be capable of development into a serious competitor of the distillation and exchange reaction methods.

Two phase counter-current methods have also been used for the partial separation of the lithium isotopes by Lewis and MacDonald. In this case two liquids were made to flow counter-currently in a vertical tube, the lithium amalgam moving downward and an alcoholic solution of lithium chloride upward through the column. The principle of the method is much the same as that of distillation except that the two phases are two immiscible liquids whereas in distillation the two phases are a gas and a liquid. These workers have succeeded in changing the ratio of the lithium isotopes by a factor of about 2.3. A somewhat similar method has been used by Taylor and Urey to produce slight changes in the relative amounts of the lithium and potassium isotopes. They used a solid and a liquid phase in the counter-current method, the solid phase consisting of a zeolite and the liquid phase of a water solution of a chloride of the alkali metal.

Such partially separated isotopes are now being used in much the same way as the heavy hydrogen or deuterium in studies on chemical kinetic, biochemical and transmutation problems. (See CHEMISTRY: *Isotopes*; HEAVY HYDROGEN.) (H. C. U.)

## Italian East Africa.

The official name promulgated by the Italian Government to designate Italian conquests and possessions in East Africa. In addition to Eritrea and Italian Somaliland (*q.v.*), it comprises the following divisions of Ethiopia (*q.v.*): Amhara, Harar, Galla and Sidamo, and Addis Ababa.

## Italian Literature.

The most important literary event in Italy during 1937 has been the completion under Gentile's direction of the *Enciclopedia Italiana*. The Italian academy has undertaken to prepare a dictionary of spoken Italian, under Bertoni. It appointed D'Annunzio as its new president, following the death of Marconi. Papini and Lucio Ambra are now members. The year saw the centenary of Leopardi. In poetry may be mentioned Betti's *Uomo e Donna*, Niroli's *La Nuova Fronde*, and Zoppi's *Azzuro sui Monti*.

Gentile's *Memorie italiane e Problemi della filosofia e della vita*, Spirito's *Lo spirito come ricerca*, Rensi's *Paradossi d'Estetica e Dialoghi dei Morti* are all important philosophical works. Cecchi publishes, in *Corso al Trotto*, a series of profound articles, and Benedetto Croce, in his review *La Critica*, had articles entitled *La Storia come pensiero e come azione*, forming an introduction to a volume of essays on history which were in preparation.

Among critical works should be indicated *L'Ultima Ascesa*, an introduction to the *Paradiso*, by Umberto Cosmo, already noted for his work on Dante; a study of Dostoevski by Donnini; *Pico della Mirandola*, by Anagnine; Cecchi's *Pittura dell'Ottocento e Novecento*; and Papini's first volume of his *Storia della Letteratura Italiana*. A noteworthy study of Italian-Swiss writers is found in *Scrittori della Svizzera Italiana*. Pancrazi considered modern

Italian literature in his *Scrittori Italiani dal Carducci al D'Annunzio*. Capasso issued the first volume of his study of D'Annunzio. Russo's *Ritratti e Disegni storici da Machiavelli a Carducci* is a serious contribution, and Rèbora has a thoughtful book *Civiltà Italiana e Civiltà Inglese*. Two important books appeared concerning Manzoni—Nicolini's *Peste e Untori nei 'Promessi Sposi' e nella realtà storica*, and the first volume of Parenti's *Bibliografia Manzoni*, a work of great value.

Among writers of fiction, Bontempelli made an experiment with his *Gente nel tempo*, published in a cheap edition. Moretti presents a somewhat Proustian picture of modern life in *Anna degli elefanti*. Paola Drigo's important novel, *Maria Zef*, is a sad and moving tale of mountain life. There were short stories and essays by Civinini, Palazzeschi, Mignosi, who died during the year, and Moravia. Lucio d'Ambra wrote the first volume of a series of literary biographies entitled *L'Autore delle duecento commedie*, devoted to Goldoni. The publisher, Mondadori, brought out the second volume of Goldoni's works.

Political science claims many books. Some of the Duce's speeches were published under the title *La Fondazione dell'Impero*, and one of Count Ciano's *La politica estera dell'Italia*. Ivon de Begnac brought out the second volume of his excellent *Life of Mussolini*; Curcio wrote *La politica dei Romani*; Maranini *La Rivoluzione fascista nel Diritto e nell'Economica*; de Michelis *Politica internazionale del Lavoro*; Orano *Gli Ebrei in Italia*; Paolini *Sistema rappresentativo del Fascismo*; Salvatorelli *La politica della Santa Sede dopo la guerra*; and Murri *Idea universale di Roma*.

Books about the Abyssinian war were numerous, among them being: *L'Albo dell'Impero*; *Atti del Secondo Congresso di Studi Coloniali* of the "Centro di Studi Coloniali" at Florence; Marshal Graziani's *Pace Romana*; Cannonieri's *Aventura tra gli Arussi*; and Starace's *La Marcia su Gondar*.

**Italian Somaliland:** see SOMALILAND, ITALIAN.

## Italy,

a kingdom consisting mainly of the peninsula projecting south into the Mediterranean from the mass of central Europe; the land boundaries, which reach as far north as the parallel of 46°40' N., being formed by France, Switzerland, Austria, and Yugoslavia. Capital, Rome. Ruler: King Victor Emmanuel III (b. 1869, *succ.* 1900). National flag: green, white, and red in vertical stripes, with the arms in the white stripe.

**Area and Population.**—Area: 119,740 square miles. Population (1936 census): 42,527,561, giving a density of 346.8 per square mile. In 1935, the balance of emigrant over immigrant Italians was 17,938. Over 99% of the population are Roman Catholics, and there are small numbers of Protestants and Jews. Elementary education is free and compulsory up to the age of 14; secondary schools are for the most part State-maintained; and there are 21 State and 5 "free" universities. The leading cities, with 1936 population figures, are: Rome 1,148,948, Milan 1,103,960, Naples 860,176, Genoa 625,355, and Turin 623,454. (X.)

**History.**—The year 1937 in Italy was notable for the development of a foreign policy to which the economic, financial, and internal affairs of the nation were definitely complementary if not subservient. On its broad lines, Italian foreign policy sought to change European and world attachment to the League of Nations as an instrument of international justice, and to oppose the principle of collective security as a guarantee of peace. That program meant cutting a path right through the post-war conception of European settlement. The events which hastened on the application of such a radical foreign policy were the bitter memories of Sanctions; misunderstandings with Britain; a declared fear of Bolshevism; events arising out of the civil war in

Spain; and dissatisfaction, among other things, with the League's delay in making any progress with the question of Italian sovereignty over Abyssinia.

Italy's method of pursuing its foreign policy was to identify Italy with Germany in a unity of purpose, creating a "Rome-Berlin Axis" of common policy; to fortify the political alliances which had bound Italy, Austria, and Hungary since the conclusion of the "Rome Protocols" of 1934 and 1936; to use the influence of these combinations on the countries of the Little Entente; to abandon Geneva; to combat the prestige of London and the British empire; to enter the Germano-Japanese Anti-Comintern Pact; and to perfect the nation's military strength through universal manhood training, rearmament, and a program of national self-sufficiency.

There was nothing concrete in the year under review to reveal what Signor Mussolini (in whose hands lay all power) held in aims as a substitute for the League and collective security. Some observers believed that his ultimate goal was a revival of the Four-Power Pact idea, with or without a fundamentally revised League of Nations. Others were convinced that his plan was to build up a confederacy of Fascist states in opposition to the democracies of Europe and the British empire. There were also those in Italy who felt that their country was being reluctantly driven into the arms of Germany by the inept diplomacy of London. Others again feared that the goal was simply an expansion of Italian empire. It is necessary to record these speculations in this survey, because they were present as characteristic and disturbing factors in the international relations of 1937.

*Foreign Affairs.*—The chronicle of complicated events in 1937, on which the foregoing generalizations are built, begins with the signing of an Anglo-Italian Declaration in Rome, on Jan. 2, concerning assurances with regard to the Mediterranean. This exchange of assurances, popularly known as the "Gentleman's Agreement," disclaimed any desire by either party to modify the status quo in the Mediterranean area. Italy and Great Britain undertook to respect each other's rights and interests in the Mediterranean, and recognized freedom of entry, transit, and exit. Each promised not to encourage activities liable to impair good relations. This all-important declaration, calculated to allay suspicions created during the Sanctions period, was accompanied by the publication of notes guaranteeing the immunity of the Balearic islands from any Italian designs—thus in turn banishing fears born of Italy's attitude to the Spanish war. On Jan. 7 an Italian memorandum in reply to an Anglo-French note on foreign intervention in Spain clearly defined the policy of Rome. Italy agreed to the withdrawal of Italian volunteers and to the prevention of the despatch of others if all the interested Powers did likewise, and if such an agreement were followed up by another to stop indirect intervention. Parallel notes by Italy and Germany on Jan. 25 emphasized their common attitude; and

on Feb. 20 severe penalties came into force in Italy against the further enrolment of volunteers. But press and other polemics on the interpretation of what constituted indirect intervention kept Italy and Europe in a state of tension. British rearmament, which at first had received a good press in Italy, began to be criticized. Italian anger over the invitation to Haile Selassie to attend the coronation of King George VI; the atmosphere surrounding the visit of Signor Mussolini to Italian North Africa when (March 18 at Tripoli) he made a demonstrative speech in favour of Islam; Italian fears of the Popular Front elements in France passing to Communist extremes; Italian indignation at hostile foreign sneers about the set-back to a column of Italian volunteers at Guadalajara; the decision on April 10 to establish an army corps in Libya; discontent with the conduct of France, Britain, and the League on the non-intervention problem; and a bitter intensification of newspaper war—all these things had already virtually negated the spirit if not the letter of the Mediterranean Agreement. In Italian eyes the incapacity and ill-will of Geneva seemed manifest. Contacts with Germany became more intimate. Rapprochement negotiations had been opened with Yugoslavia, and a new treaty was signed on March 26. General Göring went to Rome on April 26 and Baron von Neurath on May 2. A news boycott was placed on the coronation of George VI. The king and queen of Italy made a State visit to Budapest on May 19. Abyssinia was not dealt with by the League at the Council meeting of May 24. On June 2, Marshal von Blomberg was fêted in Italy. Following the Leipzig incident, Italo-German withdrawal from naval control in Spain was announced on June 23; and the Italian cabinet approved schemes for "Defence of the State Activities" and national self-sufficiency.

After a long period of reserve, it was semi-officially stated that the total number of Italian volunteers in Spain did not exceed 40,000. On Aug. 27 the press published the names of 12 Italian generals serving with General Franco's forces. Pictures of Italians at the scene of operations thereafter became an open feature of Fascist newspapers. Casualty lists were published from time to time—the latest in 1937 being that of Oct. 29, when the figures totalled 763 killed and 2,675 wounded "for the cause of the Fascist ideal in the anti-Bolshevist Spanish war." (See NON-INTERVENTION COMMITTEE; SPAIN, CIVIL WAR IN.)

And at that very moment when Great Britain and France were inviting 10 other states to confer on "submarine piracy" in the Mediterranean, Russia (Sept. 6) presented a note in Rome accusing Italy of sinking Soviet ships. That was the last straw for Italians. Italy refused to sit at the same piracy conference table as its accusers; and rejected the Nyon Plan, although accepting (Sept. 21) the Anglo-French proposal for a Paris meeting of naval experts to consider Italian "parity rights" in naval patrol.

On Sept. 25 Signor Mussolini made a State visit to Germany, where he received a spectacular welcome. In ceremonies and in talks with Herr Hitler (Sept. 25–29) he made the Rome-Berlin Axis more solid than ever; and on Nov. 6 he aligned Italy with Germany and Japan by formally subscribing to the Germano-Japanese Anti-Comintern Pact, thus providing for tri-partite consultation and action against those at home or abroad engaged "directly or indirectly" in the service or promotion of Comintern activities. In the midst of renewed newspaper tirades against democracy and against British policy in Palestine and Egypt, the Italo-Yugoslav rapprochement was completed by Belgrade's recognition of Italian sovereignty in Abyssinia. In Italy this was considered to be the beginning of the end of the Little Entente, with all that that implied in post-war European relations. Italy's foreign policy crystallized. Manchoukuo was recognized as an independent state on Nov. 16. Signor Mussolini, in the *Popolo d'Italia*, expressed sympathetic conviction that Japan would be

ITALY: Industrial production index (*The Annalist*)

victorious in China. On Dec. 12, Signor Mussolini announced that Italy had decided to leave the League of Nations. A telegram of resignation was despatched to the League secretary that night.

**Home Affairs.**—The only constitutional change carried out during the year was a measure (Jan. 9) which invested the cabinet with immediate powers to issue all necessary regulations in the event of a state of war or a state of neutrality in Italy. Such powers were previously vested in the king, but were transferred to parliament during the World War. They have now been handed over to the cabinet, which means in this case the *Capo del Governo*, Signor Mussolini. On March 2 the Fascist Grand Council decided on the adoption of a five-point program: (1) a further increase of Italy's armed strength; (2) a continuation for five years of the functions granted to the general commissariat for the manufacture of war material; (3) complete militarization of Italian man-power from the ages of 18 to 55; (4) maximum self-sufficiency as far as war needs are concerned, and the sacrifice, even total if necessary, of civil needs to military exigencies; (5) the collaboration of science and of Italian technicians in the achievement of the above aims. Italian estimates on the available man-power within the age limits of 18 and 55 were 8,800,000 effectives—which seemed an enormous figure. Application of this program affected the social life of the Italian people throughout the whole year. On April 13 a law was passed to ensure the teaching of "military culture" in all schools. A first report on the new system (begun in 1936) of training the youth of Italy in military affairs before they are conscripted for the usual army service stated that 550,000 young men, divided into 7,000 instructional classes, had gone through a course of training, and that 95% of them had gained first-class military certificates. Other laws for the inculcation of military ideas in the young were passed. The most important of these was a decree, dated Oct. 27, which amalgamated all the various children's Fascist organizations for both boys and girls into one enormous institution under the direct control of the secretary of the Fascist party. Boys and girls from the ages of six years onwards were thus gathered into a training bloc of over seven million souls.

The number of persons belonging to the Fascist party or affiliated to its various organizations on Oct. 29, 1937,—the beginning of "the Sixteenth Year of the Fascist Era"—was 11,408,153. Of these, 2,152,240 were actual members of the party, in that they held the "Party Ticket." On Feb. 12 all Italy rejoiced in the birth at Naples of a son and heir (Victor Emmanuel, Prince of Naples) to Crown Prince Umberto and Princess Marie José. (I. S. Mv.)

**Trade and Communication.**—Over 70,521,000 ac. are under cultivation, of which about 25.5% was devoted to cereals, 3.5% to leguminous plants, 3.5% to vines, and about 3% to olives. Mining output of natural resources in 1935 (metric tons) was: iron pyrites and iron ore, 1,384,900; bauxite, 170,000; zinc, 144,000; mercury, 118,550. The year 1937 ended with a trade deficit of over £59,500,000, exclusive of trade with the Italian colonies. Imports were increased by about £21,600,000, and Germany is increasingly Italy's best customer. The 1937 wheat crop was a record one of 80,561,670 quintals (84 million quintals are estimated as required for self-sufficiency). Communications included (1935) 22,980 km. of railways and (1936) 20,631 km. of national roads; (1936) a mercantile marine of 1,246 vessels; and (1935) 20,802 km. of air lines.

**Finance and Banking.**—The unit of currency is the lira, the average rate of exchange for sterling during 1937 being 95 lire to the pound, or 19 to the dollar; the par rate of exchange is 92.46 lire to the pound. Budget receipts for 1936–37, as published on Dec. 15, 1937, showed £267,164,179 (all sterling figures here given are at the par rate of exchange); and expenditures were: "Ordinary" £253,223,015, and "Extraordinary" £189,476,-

530. There was therefore a surplus of £13,941,164 over ordinary expenditure, but a total deficit of £175,535,366. The £13,941,164 "ordinary" surplus was carried over to the receipts of the Extraordinary Budget, the details of which were, and are, not disclosed. On Oct. 10 a 10% capital levy was imposed on all foreign and Italian limited companies, assessed on paid-up capital and reserves as at Oct. 5, 1936. About 43 millions is expected to be raised from this, which, if industrialists borrow from the Bank of Italy, should cover threatened Treasury deficits until Oct. 1938. The Banca d'Italia is the only bank of issue, as the notes in circulation (Feb. 1937) in Italy and East Africa amounted to 15,677 million lire. The proportion of gold reserve for circulation was 25.64%.

**Defence Forces.**—As has already been indicated, practically the whole male population of military age and under has been organized on a military basis. (See also NAVIES OF THE WORLD; AIR FORCES: *World*.)

**Ives, Frederic Eugene** (1856–1937), American inventor, who originated the half-tone process of photo-reproduction, the modern binocular microscope, and the intaglio process which led to rotogravure. As he neglected to patent several of his important inventions, he always remained in modest circumstances. He styled himself "an amateur inventor," publishing his autobiography under that title in 1928. He died in Philadelphia, May 27, 1937.

**Jamaica**, a British colony in the West Indies; language, English; capital, Kingston (estimated population in 1935, 115,000); Governor, Sir Edward Denham. The area is 4,540 square miles. The population by the latest census (1921) was 858,118 and was officially estimated at 1,138,558 (1936). The colony is administered by a governor and legislative council of whom a minority is elected. Jamaica has extensive shipping connections and regular air service with outside points. It has 210 miles of Government-owned railways, and an extensive highway system. Imports and exports for 1936 were valued at £4,923,931 and £3,807,239 respectively, a slight decrease from 1935. Imports are principally foodstuffs and manufactured articles, 73.1% from the British Empire (Great Britain, 39.6%; Canada, 16%), and 16.4% from the United States. Bananas comprise half the exports, with sugar, spices, rum, and coffee also important. Exports went chiefly to Great Britain (55%), Canada (29.5%), and the United States (7%). Production is preponderantly agricultural. The banana industry, valued at £2,250,000 annually, leads, but is gradually losing pre-eminence, with sugar and rum production on the increase. The orange crop in 1936 doubled that of 1935 and quadrupled that of 1934, in consequence of the development of the New Zealand market. The monetary unit is the British pound sterling (approximately \$5). Revenue for the year 1935–36 was £2,121,965, expenditure £2,178,228. The public debt was £3,780,653 (1936). Jamaica had 653 Government-aided elementary schools (1936) with 150,557 enrolment, maintained at a cost of £187,309, and 24 grant-aided secondary schools. (L. W. BE.)

**Jameson, John Franklin** (1859–1937), American historian and chief of the Manuscript Division of the Library of Congress from 1928–37, was born near Boston, Mass., Sept. 19, 1859. After graduating from Amherst College in 1879, he studied at Johns Hopkins where he taught for several years after receiving his doctor's degree in 1882. From 1888–1901 he was professor of history at Brown, leaving to assume headship of the University of Chicago department of history in 1901. In 1905 he became director of historical research for the Carnegie Institution of Washington, a post held until he

undertook his work in the Library of Congress. Although the author of several historical studies, he was best known as an editor, his productions including the *Correspondence of John C. Calhoun* (1900) and the *Original Narratives of Early American History* (1906-17). From 1895-1901 and from 1905-28, he served as managing editor of the *American Historical Review* and most recently (1922-1936) as chairman of the committee of management for the twenty-volume *Dictionary of American Biography*. He died in Washington, Sept. 28, 1937.

**James Tait Black Memorial Prizes:** see LITERARY PRIZES: Great Britain.

**Japan,** an Empire, capital, Tokyo; ruler, Emperor Hirohito; premier, Prince Fumimaro Konoye. It consists of a chain of islands in the western Pacific, stretching from South Sakhalin (50° of latitude) to the South Seas Mandated islands (which lie near the equator) and of the Korean peninsula, on the mainland of Asia, and the small Kwantung leased territory, with the city of Dairen, on the Liaotung peninsula. Japan Proper consists of the four main islands of Honshu, Hokkaido, Shikoku and Kyushu, while Korea, Formosa, and South Sakhalin are administered as colonies. This is also true of the South Seas islands, which were granted to Japan under a mandate from the League of Nations after the World War. The total area of the Japanese Empire is 263,359 sq.mi., of which Japan Proper accounts for 148,756 square miles. Population of the Empire (census, Oct. 1, 1935) was 97,697,555, divided as follows: Japan Proper, 69,254,148; Korea, 22,899,038; Formosa, 5,212,426; Kwantung Province and South Manchuria railway zone, 1,656,726; South Sakhalin, 331,943; South Seas Mandated islands, 102,537. By the end of 1937 the population of the Empire was in excess of 100,000,000, that of Japan Proper being estimated at 71,252,800 on Oct. 1, 1937. Population of leading cities (census, 1935): Tokyo, 5,875,667; Osaka, 2,988,874; Nagoya, 1,082,816; Kyoto, 1,080,593; Kobe, 912,179; Yokohama, 704,290.

**History.**—(For the Chinese-Japanese War see that heading.) The Japanese Imperial Diet is bicameral, consisting of a House of Representatives, elected by universal suffrage, and a House of Peers. The latter is made up of all Imperial Princes, other Princes and Marquises, of elected representatives of the other orders of

the aristocracy, Counts, Viscounts and Barons, of representatives of the wealthy business classes and of statesmen and scholars appointed in recognition of public services. There were 408 members of the House of Peers in January, 1937. The results of the last election to the House of Representatives (held in April, 1937) by party and number were as follows: Minseito, 179; Seiyukai, 175; Social Mass, 36; Showakai, 18; Kokumin Domei, 11; Tohokai, 11; Independents and small groups, 36; total, 466.

There was in 1937 little difference between the two traditional large parties of Japan, the Minseito and the Seiyukai, as regard political program. The former was stronger in the towns, the latter in the country districts. During the period of 12 or 13 years after the World War when parliamentarism was at its height in Japan, the Minseito was considered somewhat more liberal in internal and international policy and more orthodox in finance than the Seiyukai; but the march of events has largely obliterated the former issues between these parties. The Social Mass party, which polled its largest vote of about 900,000 in the last election, is committed to a platform of moderate socialism. The Tohokai is a rightwing semi-fascist grouping, while the Showakai and Kokumin Domei are small groups of secessionists from the Seiyukai and Minseito respectively. Since the political outbreak of May 15, 1932, there have been no party cabinets in Japan. All cabinets, including the present one, headed by Prince Fumimaro Konoye, have been formed on a national basis, although only one cabinet, the short-lived one of General Senjuro Hayashi, failed to include representatives of the larger parties.

**Trade and Communications.**—Japan's exports in 1936 were 2,692,976 yen and imports were 2,763,681 yen. Exports in 1937 were 3,175,424 yen; imports were 3,783,177. Among Japan's more important exports are cotton goods, raw silk, rayon tissues, machinery, canned fish and other foodstuffs, woollen and knitted goods, ceramics and rubber goods. Its more important imports include raw cotton, wool, petroleum, scrap iron, iron ore, lead, copper, tin, machinery, and equipment.

There were 14,612mi. of Government and private railways on Dec. 31, 1935, in Japan Proper, besides 2,782mi. in Korea, 935mi. in Formosa and 300mi. in South Sakhalin. A total of 3,563 steamers of 3,964,175 gross tons were registered in Japan in 1936. The number of sailing ships was 15,531; the gross tonnage, 918,673. Japan had 235 commercial aeroplanes on Oct. 1, 1935. Air routes link up the main cities of Japan Proper and regular air service is maintained between Japan Proper, Formosa, the South Seas islands, Korea and Manchoukuo. An air route between Japan and Tientsin has been installed recently. During the year 1935-36 Japan's aeronautical companies carried 11,877 passengers, 75,643 kgs. of goods and 265,564kgs. of mail. There were 8,931 telegraph stations in Japan Proper in 1936 and 11,471 post offices. There were 232,000mi. of telegraph lines, handling about 65,000,000 messages annually. In March 1936, there were 5,310 telephone exchange offices in Japan Proper, with 870,476 subscribers.

**Agriculture, Manufactures, and Mining.**—There were 5,610,607 farm households in Japan at the end of 1935. This figure shows little change from year to year. Much the most important crop in Japan was rice, with the breeding of silk worms as a secondary source of income for farmers in some parts of the country. Other agricultural products were wheat, rye, barley, oats, potatoes and sweet potatoes. At the end of 1935 there were in Japan 1,448,481 horses, 1,684,461 cattle, 1,063,000 swine, 47,303 sheep, and 278,000 goats.

Japan's main natural resources are its fisheries, which provide an important item in the national diet, its fertile and well cultivated rice-lands, its abundant supply of cheap hydro-electric power and the timber which supplies raw material for its large and growing paper industry. In the main, however, Japan is

JAPAN: Industrial production

PRINCE FUMIMARO KONOHE, Japan's prime minister

FIELD MARSHAL PRINCE NASHIMOTO, one of the five members of the powerful Military Council, which is responsible to the emperor only

GENERAL SEISHIRO ITAGAKI, chief of staff on the Asiatic mainland for General Ueda

GENERAL COUNT TERAUCHI, minister of war and member of the Military Council

HIS IMPERIAL HIGHNESS FIELD MARSHAL PRINCE KAN-IN, chief of the General Staff and member of the Military Council

GENERAL KENKICHI UEDA, commander of Japan's Kwantung army in China and member of the Military Council

LIEUTENANT GENERAL KENJI DOIHARA, so-called "super-spy," attached to the Tokyo General Staff

GENERAL SUGIYAMA, inspector general of military education and member of the Military Council

scantly supplied with natural resources; and its industries have been built up on a basis of importing minerals and raw materials from abroad and working them up as manufactured goods for domestic use or for export.

Industry gives employment to about 6,000,000 people in Japan, of whom about half are employed in tiny workshops employing less than five persons. These small workshops, where wages are extremely low, are an important factor in Japan's economy. The most important single industry is the output of textiles. Japan leads the world in the production of rayon and exports of cotton cloth reached the figure of 2,709,884,000 sq.yds. in 1936. Japan's most striking gains in recent years have been in the heavy industries, such as metallurgy, machine-building and chemicals. Japan ranks fourth as a producer of chemicals. The value of its output of machinery and tools was 1,458,000,000 yen in 1935, as against 410,133,000 yen in 1931. Other important industries are the generation of electrical power, food products, paper, wood products and ceramics. Apart from coal, Japan is not rich in minerals; but mining output has been increasing under the stress of industrial demand. In 1936, Japan produced 38,067,000 tons of coal, as against 34,904,000 tons in 1935; 78,114 tons of copper, as against 69,289 in 1935; 21,114 kgs. of gold, against 17,837 kgs. in 1935; 38,204,620 hectolitres of petroleum products, against 34,904,000 hectolitres in 1935.

**Banking and Finance.**—The unit of currency is the yen (equivalent to 29.15 American cents at the end of 1937). The budget for 1937–38 (the Japanese fiscal year runs from April to April) was 2,813,937,971 yen and was the largest in Japanese financial history. The preliminary budget estimate for 1938–39 is 2,868,000,000 yen. Both these budgets leave out of reckoning the financing of the military operations in China. A sum of almost 2,600,000,000 yen had been appropriated for this purpose during 1937 and was mainly to be raised by loans. Japan's national debt has been increasing steadily since 1931. At the end of 1936 it amounted to 8,522,439,750 yen, owed within the country and 1,331,860,889, owed abroad, in America, Great Britain and France. By the end of 1937 the total debt was in excess of 13,000,000,000 yen, leaving out of account the added burden of the foreign debt because of the greater depreciation of the yen, in comparison with the dollar and the pound.

The Bank of Japan is the central bank and has the privilege of issuing convertible banknotes. The Yokohama Specie Bank is in charge of foreign exchange transactions and finances foreign trade. Commercial banking is largely in the hands of seven large banks: the Mitsui, Mitsubishi, Dai-ichi, Sumitomo, Yasuda, Daihyaku and Sanwa. Foreign banks operating in Japan include the Hongkong and Shanghai Banking Corporation, the Chartered Bank of India, Australia and China, the National City Bank of New York, the Banque Franco-Japonaise, and the Nederlandsch-Indische Handelsbank.

**Education and Religion.**—There were 46,138 schools of all kinds in Japan in 1935, with 14,035,823 students. Elementary education is compulsory, and the percentage of attendance among children of school age is 99.58. Japan has 45 universities with 71,162 students. Freedom of religion is guaranteed by the Japanese Constitution. The latest official statistics (end of 1933) reveal 41,127,307 Buddhists, 16,525,840 Shintoists, and 439,444 Christians in the country.

**Army and Navy.**—The Japanese army is raised on a basis of universal liability to service of all male Japanese between the ages of 17 and 40. Its peacetime strength is officially stated at about 230,000, organized in 17 divisions; no official figures have been published of the war strength reached at the end of 1937. The strength of the navy, as of Sept. 30, 1936, was officially stated at 302 warships, of a total tonnage of 1,134,823, including nine bat-

tlehips, 12 first class and 25 second class cruisers, six aircraft carriers and three seaplane carriers. Japan gave two years' notice of denunciation of the Washington Naval Treaty at the end of 1934. After an abortive conference at London in Dec. 1936 and Jan. 1937, Japan, along with all other signatories of the Washington Naval Treaty, resumed full freedom of naval construction. (See also CHINESE-JAPANESE WAR.)

**BIBLIOGRAPHY.**—Annual issues of *The Japan Year Book*; T. Yano and K. Shirasaki, *Nippon: A Charted Survey of Japan, 1936*; *Japanese Trade and Industry: Present and Future*, by the Mitsubishi Economic Research Bureau; Ryoichi Ishii, *Population Pressure and Economic Life in Japan*. (W. H. CH.)

**Japanese-Chinese War:** see CHINESE-JAPANESE WAR.

**Java,** fourth in size but most important in population and resources among the islands of the Dutch East Indies, is separated from Sumatra to the west by Sunda strait and from Bali to the east by Bali strait. With the adjacent small island of Madura, Java in 1930 had a population of 41,719,524, mostly people of Malay race professing the Mohammedan religion. The area of Java and Madura is 50,752 square miles. Java is the most densely populated land in the world, with 821 inhabitants to the square mile. Because of this density of population the economic crisis of 1929–33, during which period the quantity of Dutch East Indian exports declined by 17%, the value by 67%, brought a good deal of unemployment and distress. The number of labourers employed on large estates decreased from 1,200,000 to 600,000. The Government has endeavoured to cope with this situation by organizing migration to the less thickly peopled neighbouring island of Sumatra and by encouraging the development of native industries. Another noteworthy result of the crisis was the marked increase in the purchase of cheaper Japanese goods. Japan's share in the import trade of the Dutch East Indies increased from 10% in 1928 to 30.9% in 1933. Further growth has been checked by the introduction of a quota system for Japanese goods. Approximately 40% of the land in Java is under cultivation, the remainder consisting mainly of mountains and forests. The island produces 99% of the world's supply of quinine and is rich in sugar, coffee, tea, cocoa, indigo, spices, tobacco, rubber, tin, and petroleum. (W. H. CH.)

**Javelin Throw:** see TRACK AND FIELD SPORTS.

**Jazz.** The development of jazz during 1937 emphasized more than ever that this peculiarly modern and characteristically American form of art represents a treatment of musical materials rather than a definite kind of music. Jazz itself has been most accurately defined as "the distortion of the conventions of music." Orthodox music can be distorted not only rhythmically, but also from the standpoint of melody, harmony, tone colour, and form, and all of these distortions enter significantly into up-to-date jazz. "Swing," which is the current equivalent of "hot jazz," may be considered the latest and the most complicated form of musical distortion. After eliminating the vast amount of nonsense that has been written about "swing," it becomes obvious that this form of jazz consists of nothing more than improvised variations on a theme. These improvisations may be individual, with one member of a band, or collective, with the entire ensemble treating the basic melody independently and simultaneously. That the tune is often completely buried is considered no handicap.

Essentially such music is a revival of the raucous jazz that flourished before the World War, with the difference, that the modern instrumentalists are technically far superior to those of the past. Even the best performers, however, inevitably repeat

the same tricks and patterns *ad infinitum*, and the general interest in their playing seems due chiefly to astonishment at spectacular technique. Devotees of "swing" take these performances very seriously. With this constant emphasis on treatment and interpretation, modern popular music has swung away from publication toward a concentration on arrangements, phonograph records, and radio performances. The skilled arranger is today more important than the composer himself, and much of the recent jazz consists merely of new arrangements of old tunes. Outstanding arrangers who have come to the fore as creators and conductors are Larry Clinton, responsible for *Satan Takes a Holiday*, and Will Hudson, who wrote the popular *Organ Grinder's Swing* (definitely a jazz ornament rather than a tune) and *Mr. Ghost Goes to Town*. Most of this new music is written for performance rather than publication, and means little or nothing in its printed form. Duke Ellington has added to his past successes with *Caravan*, and the authentic Negro style is maintained by such interpreters as Cab Calloway, Louis Armstrong, "Fats" Waller and Art Tatum, with Reginald Forsythe developing rapidly as a sophisticated composer. But white men have gone even further with "swing," led by Benny Goodman, Bunny Berigan, Louis Prima and the Dorsey brothers. Eddie Duchin and Alec Templeton have given new character to popular piano-playing, and the successful band leaders have included Shep Fields, Horace Heidt, Leo Reisman, Sammy Kayes, Richard Krimmer, Abe Lyman, Ray Noble and such established names as Guy Lombardo, Fred Waring, Wayne King, Glen Gray, Rudy Vallee, Vincent Lopez, and Paul Whiteman. On the screen, the teams of Gordon and Revel and Warren and Dubin have held their own, with George Gershwin's posthumous work setting a high standard. Rodgers and Hart contributed some good scores to the stage, while Hoagy Carmichael and Stanley Adams came through with the individual success, *Little Old Lady*. Such stars as Irving Berlin and Jerome Kern remain undimmed in the heaven of popular music, with Arthur Schwartz, Vernon Duke, Johnny Green, Nat Shilkret, Billy Hill and others still capable of turning out a good tune. It has been definitely proved, however, that jazz today demands adaptation rather than invention, and all signs point toward a continued development in the same direction. (See also SONGS, POPULAR.)

(S. Sp.)

**Jewels:** see FASHION AND DRESS: *Jewels*; GEMS AND PRECIOUS STONES.

**Jewish Race, Distribution of.** For the following reasons it is difficult to ascertain the exact number of the Jews (according to religion) at a given year on the basis of the official census figures:

1. In various countries, such as Iran, Yemen, Brazil, no census at all has so far been taken.
2. In some other countries, for instance, England, France, Belgium, United States, Argentina, the census does not indicate the religion of the inhabitants.
3. The last census available was not carried out in the same year in all countries, but in different years during the period 1921 to 1936.

We, therefore, have either to rely entirely on estimates (as in cases 1 and 2), or to complete the last census figures by estimates mainly based on data regarding natural increase and migration since the last census, in order to find out the number of Jews at the end of the year 1937.

The following is the approximate number of the Jewish race in those countries of the world estimated at having more than 10,000:

United States . . . . .	4,650,000	Great Britain and	
Poland . . . . .	3,275,000	North Ireland . . . .	340,000
Russia (European) . . .	3,000,000	France . . . . .	270,000
Rumania . . . . .	800,000	Argentina . . . . .	270,000
Hungary . . . . .	440,000	Austria . . . . .	180,000
Palestine . . . . .	420,000	French Morocco . . .	175,000
Germany . . . . .	365,000	Canada . . . . .	170,000
Czechoslovakia . . . . .	360,000	Lithuania . . . . .	160,000
World Total . . . . .	16,651,000		

Distribution of the Jews in the Americas

		According to the last Census or Estimate					Estimated Number of Jews at the End of the Year 1937
		Total Population		Jewish Population			
		Year	Number	Year	Number	Per cent of total Pop.

Total in America . . . . .							5,226,000

**Jewish Religious Life.** A grave menace to the Sabbath which is cardinal in Jewish religious life, fell away in 1937 when the League of Nations Council removed from consideration a plan of calendar reform which would make the seventh day Sabbath fall in successive years on different days in the week. Another menace developed in the recommendation of the Palestine Royal Commission that Jerusalem be excluded from the proposed Jewish State in Palestine. This suggestion aroused condemnation among all Jews, and also from such sources as the Archbishop of Canterbury.

The most marked changes in Jewish religious life in 1937 arose out of political conditions. Judaism continued to lose ground in Soviet Russia as more of the youth grew up indoctrinated with anti-God teachings. In Germany the remorselessly methodical "liquidation" of Jews continued, involving the closing of numerous historic Jewish communities in small towns, the closing of the B'nai B'rith lodges, the arrest of prominent rabbis, and towards the end of the year the Jews of Danzig also came under unrestrained Nazi control. In Rumania, Jewish communities continued to suffer, while the steady grinding to destruction of 3,000,000 Jews in Poland continued, accompanied by riots in which synagogue worshipers were attacked, synagogues burnt, and the Jewish ritual killing of cattle was made illegal. In Italian North Africa Jews were made to suffer because of refusing to open their stores on the Sabbath, and the Jews of Italy were subjected to a Fascist drive in the press to constrain their freedom of thought. Resultant communal divisions led the executive board of the Union of Jewish Communities to resign.

On the other hand, organized efforts to offset intolerance and cultivate intercreedal goodwill were particularly noticeable in England and the United States. It is worthy of record that Hammonton, N.J., built a synagogue for its little Jewish community of 18 families largely with money given by Christians in response to the appeal of Christian ministers of the town.

The quinquennial meeting in Marienbad of the Kenesia Gedola of the Agudath Israel was an impressive demonstration of the strength of right wing orthodoxy throughout the world.

Death claimed Nathan Birnbaum (Mathias Acher), a former radical who became a leader of European right wing orthodox Judaism, Prof. Ezekiel Moses Ezekiel of Bombay, Aaron Hyman, Talmudic scholar of England and Palestine, Rabbi Abner Oklanski, head of the rabbinical academy at Telz, and the Rev. Henry Pereira Mendes, dean of the rabbinate in the United States.

See *American Jewish Year Book XXXIX*, 1937–38, pp. 205–502. (See also ANTI-SEMITISM.) (D. DE S. P.)

**Jewish Welfare Board** carries as a sub-title "National Organization of Young Men's Hebrew Associations, Young Women's Hebrew Associations, and Jewish Community Centers." This comprehends the character of the local organizations that are affiliated with the Board, numbering 318 in various parts of the United States and Canada. The Jewish Welfare Board was organized April 9, 1917, in behalf of the Jewish men in the Army and Navy of the United States. The Council of Young Men's Hebrew and Kindred Associations, which was organized Nov. 2, 1913, was merged with the Jewish Welfare Board July 1, 1921.

The purpose of the board, briefly stated, is "to promote the social welfare of soldiers, sailors and marines in the Army and Navy of the United States" and "to promote the religious, intellectual, physical and social well-being and development of Jews, especially young men and women." The board advises its affiliated organizations as to programs, membership policies, problems of management, finances, personnel, and community relationships; makes community surveys; plans programs; co-operates in the training of personnel; and publishes *The Jewish Center* quarterly and *The Jewish Center Supplement*.

The Y.M.H.A.'s, Y.W.H.A.'s, and Jewish Community Centers conduct programs of Jewish, cultural, educational, recreational, social, physical education, health, camping, civic, and communal activities. They own 233 of their buildings, valued at \$35,000,000, and they have an estimated membership of 370,000, the membership including all ages and both sexes. Their annual expenditures in 1936 amounted to \$4,600,000. The National Association of Jewish Center Workers, composed of members of professional staffs, which meets annually, held its last convention in Indianapolis May 19–23, 1937. The annual meeting of the Jewish Welfare Board took place April 25, 1937, in New York city. Its president is Judge Irving Lehman and its executive director, Harry L. Glucksman.

(F. L. W.)

**Johns Hopkins University** is located in Baltimore, Md. Enrolment for 1937 in the several schools of the University was as follows: School of Higher Studies of the Faculty of Philosophy, 310; School of Higher Studies in Education, 34; Engineering, 329 (including 25 graduate students); Arts and Sciences, 521; Business Economics, 108; Medicine, 287; Hygiene and Public Health, 150. Enrolment in the afternoon and evening courses was 3,299 and in the summer school 870. At the end of the fiscal year the endowment of the University was valued at \$29,874,437 and income from all sources for the year was \$2,950,180. Simon Flexner, former head of the Rockefeller Institute for Medical Research, and John W. Garrett, former Ambassador to Italy, were added to the Board of Trustees. Johns Hopkins received during the year several substantial bequests, including \$323,717.33 from the James Swan Frick estate, \$50,000 from the estate of Miss Amelia Marburg, and the residue of the estate of Louis J. Boury of New York, which, it is estimated, will total \$1,000,000. The main library, containing more than 500,000 bound volumes, was enriched during the year by the will of the late Leonard L. Mackall, who left the University

his private library of approximately 10,000 volumes.

**Johnson, Martin Elmer** (1884–1937), American explorer whose expeditions with his wife the former Osa Leighty, carried him since their marriage in 1910 to the South Sea Islands, Australia, Borneo, Malaya, Ceylon, India, and Africa. In Africa the Johnsons carried on the work started by Carl Akeley, making a motion picture record of the vanishing wild life of that continent for the American Museum of Natural History during 1924–29. The last and most famous of their films was *Congorilla*, a study of life among the pygmies of the Belgian Congo. These adventures were further described in such books as *Cannibal Land* (1917), *Camera Trails through Africa* (1924), *Safari* (1928), and *Lion* (1929). Martin Johnson was born in Rockford, Ill., Oct. 9, 1884, and started his adventurous career in 1905 when he accompanied Jack London and his wife on the voyage of the "Snark" to the South Seas. He died in Los Angeles, Calif., Jan. 13, 1937, as a result of injuries sustained in the crash of a transport aeroplane.

**Johnson, Robert Underwood** (1853–1937), American poet, editor and diplomat, was born in Washington, D. C., Jan. 12, 1853. Soon after graduating from Earlham College in 1871, he became connected with the editorial staff of *Scribner's Monthly*, afterwards the *Century Magazine*, of which he became associate editor in 1882 and editor in 1909. During these years, he was prominent in the American Copyright League, of which he was secretary from 1882 until his death. He was also active in the conservation movement, playing a part in the creation of Yosemite Park and the institution of the White House Conservation Conferences during Theodore Roosevelt's administration. Known as an admirer of Italy, he served as ambassador there during 1920–21. He was secretary of the National Institute of Arts and Letters (1903–09), a founder of the American Academy of Arts and Letters (1903), and the director of the New York University Hall of Fame from 1911 to his death. Following publication of his first book of poems in 1891, he issued new volumes at regular intervals until the appearance of *Aftermath* in 1933. His death occurred in New York City, Oct. 14, 1937.

**Juliana**, H.R.H. Princess of the Netherlands and Lippe Biesterfeld (1909– ), was born at The Hague April 30, 1909, only child of Queen Wilhelmina and her Consort Henry, Duke of Mecklenburg (*d.* 1934). Brought up upon democratic lines, she was educated at the University of Leyden, and was from an early age popular throughout the country. In September 1936 she was betrothed to Prince Bernhard Leopold of Lippe Biesterfeld (born at Jena, June 29, 1911), son of Prince Bernhard Casimir (*d.* 1934). After travelling he joined the German chemical firm, I. G. Farbenindustries Aktiengesellschaft (Jan. 1, 1936), representing them in Paris and later at Amsterdam. The wedding took place at The Hague on Jan. 7, 1937. The Prince was created Prince of the Netherlands.

On Jan. 31, 1938, Princess Juliana gave birth to a daughter, Princess Beatrix Wilhelmina Armgard.

Justice, Department of: see GOVERNMENT DEPARTMENTS AND BUREAUS.

**Jute.** Prices for jute in Calcutta touched the lowest point of 1937 in December, after a year during which the government had successfully maintained improved price levels. Production of Indian jute mills in the first 11 months of 1937 was 762,488,993yds. of hessian cloth, an increase of 109,365,905yds. over the corresponding period in 1936. The output of sacking by Indian mills for 11 months in 1937 was 1,326,570,742yds., a gain of 104,409yds. over 1936.

Reports from London give the average price level for 1937 as 20 ros. a ton for Firsts, compared to £18 7s. 6d. in 1936 and 18 ros. in 1935. An active market developed early in 1937 and in March 1 restrictions were removed on the number of working hours and the number of looms operated. In May the prices per ton for Firsts had advanced to £23 10s., but there was a sharp reaction and prices dropped to £19 5s., regaining a part of the loss and going to £21 17s. 6d. in July. Although succeeding fluctuations were in a narrow range the market touched £18 5s. in December. Negotiations were under way at the end of the year for a reduction of mill hours, a condition necessary to improved prices, was predicted. (S. O. R.)

**Juvenile Delinquency.** The trends in the U.S. in the field of treatment and prevention of youthful crime in 1937 continue to follow programs laid down at the White House Conference of 1934. Emphasis is on better statistical methods of reporting volume, on community efforts in prevention, on professional standards in the training of workers, on a more critical evaluation of methods, and on co-ordination of governmental and private agencies.

The press continues to write about the increasing lawlessness of youth. This is not borne out by what data are available. The Federal Children's Bureau is the most reliable source of the index of juvenile delinquency. Thirty-four courts in 18 States now report. There is variation in communities, but the downward trend of arrests of persons under 16 amounts approximately to 1% over a five-year period. The States reporting decrease in the number of delinquency cases disposed of by the courts are Alabama, California, Connecticut, District of Columbia, Georgia, Indiana, Iowa, Maryland, Massachusetts, Minnesota, New Jersey, New York, North Carolina, Ohio, Pennsylvania, South Carolina, Utah, Virginia, and Wisconsin. Girls' cases dropped only 5%. Negro cases dropped 10%; white cases 7%.

During the first quarter of 1937, 2,166 city departments submitted crime reports to the Federal Bureau of Prisons, an increase of 55 cities on the first quarter of 1936, covering a population of 1,96,843. It is impossible to show the rates per 100,000 for age groups, since the entire population is not included and the number of each age group in the samples submitting reports is not known. Yet, it is noted that the decrease in arrests of boys between 16 and 21 is 13% over the preceding year. Males and females 19 years of age show the highest commitment rates. It is likely that the rising age commitment rate will continue.

Co-ordinating councils for prevention have been developed in California and elsewhere to unite the work of schools, courts, churches, clubs and social agencies. A significant development in psychiatry applied to group control of delinquency is the publication by the Commonwealth fund of Dr. Plant's ten year experiment in Essex county, New Jersey. The Progressive Education Association has devoted various meetings throughout the country to a discussion of behaviour problems. The American Youth Commission is undertaking an intensive study of juvenile delinquency. Dr. Henry B. Elkind, director of the Massachusetts

Society for Mental Hygiene has projected a method for the evaluation of juvenile courts and clinics. The training of professional workers and their employment has been described by the American Association of Social Workers. (M. V. W.)

**Great Britain.**—Although the number of juveniles charged with indictable offences has increased tremendously in recent years (from 11,247 in 1928 to 22,393 in 1935), it is pointed out, in the volume of criminal statistics issued by the Home Office in July 1937, that it is unsafe to assume that there has been a real increase in juvenile delinquency corresponding to the increase in the number of young persons charged and found guilty in the courts.

According to the latest criminal statistics, published in July 1937, boys and girls under the age of 17 formed 37% of the total number of persons charged with indictable offences. Eighty-three per cent were dealt with under the Probation of Offenders Act. Of these, 51% were bound over with the supervision of a probation officer, 8% were bound over without supervision, and 24% were dismissed after charge proved. The number sent to Home Office schools was 2,340, or 9%.

The districts in which the proportion of juvenile offenders placed under the supervision of a probation officer was substantially smaller than the average of 51% were few, the only notable exception being Carmarthen, which so dealt with only 16 out of 106 juvenile offenders. Of the large cities, those in which the proportion was comparatively low were Liverpool (28.6%) and Bristol (22.5%). On the other hand, in Birmingham the proportion was as high as 70.6%. Some of the towns in which the proportion was below the average are among the few which use birching as a method of dealing with juvenile cases.

The new Prison Reform bill (presented to Parliament in Feb. 1938) proposes a modification of the Borstal system of imprisonment for young offenders, by unifying sentences to a uniform three years—instead of the two- and three-year sentences now imposed. The power of release after six months, if the offenders show that they have benefited from treatment, will not be affected. (See also CRIME.) (VI. BR.)

**Kamerooks:** see CAMEROONS.

**Kansas,** a central State of the United States admitted Jan. 29, 1861, popularly known as the "Sunflower State"; area, 81,774 sq.mi.; population according to the U.S. census of 1930, 1,880,999. (State census of 1937, 1,823,629.) Capital, Topeka, 64,120. (State census of 1937, 75,117.) It is the third city in size, the largest being Kansas City, 121,857 (State census of 1937, 125,137), and Wichita, 111,110 (State census of 1937,

103,629). Of the State's population (1930) 729,834 were urban, or 38.8%; 66,344 were coloured; 1,723,131 were native-born white and 69,716 were foreign born.

**History.**—In the biennial election of 1936, Walter A. Huxman, a Democrat was elected governor, but Republican majorities were returned to both houses of the legislature. Other State

officials are W. M. Lindsay, Lieutenant Governor; Frank J. Ryan, Secretary of State; George Robb, Auditor; J. J. Rhodes, Treasurer; Clarence V.

WALTER A. HUXMAN, governor of Kansas

Beck, Attorney-General; W. T. Markham, Superintendent of Public Instruction; Charles F. Hobbs, Commissioner of Insurance. The leading legislation for the session of 1937 included soil conservation; an act regulating the relations between the State banking system and the Federal Deposit Insurance Corporation; a Social Welfare Act providing for co-operation with the Federal Social Security Act, and applying to old age assistance, to dependent children and to the blind, the system to be administered primarily by the county authorities; an act providing State aid to the weaker elementary schools; several acts relating to alcoholic liquor, one legalizing, for the first time since the adoption of the prohibitory amendment to the constitution in 1880, the sale of liquor containing not more than 3.2% of alcohol by weight and other acts providing for taxation and regulation of the liquor business. This legislature authorized for the first time a sales tax of 2% upon the sale of tangible personal property, the proceeds to be applied to the financing of the social welfare program and the State aid to the elementary schools.

**Education.**—The State has over 200 public libraries, of which over half are tax supported. There are twelve municipal and eight private junior colleges, sixteen private four-year colleges, and five State supported institutions of collegiate grade. Other State educational institutions are a vocational school and institutions for the blind and deaf. For the school year 1935–36, the last for which data are available, there were 6,777 one teacher district schools in operation with an enrolment in the eight elementary grades of 88,809. There were 1,000 two or more teacher districts (excluding cities of first and second class) with enrolments in the elementary grades of 85,308. The 88 cities of first and second classes had elementary enrolments of 120,065.

**Agriculture.**—According to the U.S. census of 1930, the four leading money crops of 1929 were wheat (50% of total crop value), corn (24.1%), hay (8%), and oats (3.2%). Winter wheat production for 1937 (U.S. Dept. of Agriculture estimates) was 158,040,000 bu. as compared with the five-year average (1928–32) of 177,054,000; corn 54,876,000 (five-year average 126,756,000); oats 35,075,000 (five-year average 34,515,000); tame hay 1,168,000 tons (five-year average 1,814,000). Winter wheat planted in the fall of 1937 was estimated at 17,500,000 ac., the largest on record and the third successive record-breaking planting, constituting 30% of the winter wheat acreage of the U.S. The U.S. census of Agriculture for 1935 credited Kansas with 3,386,179 cattle, 1,119,000 swine, 589,375 horses, and 15,140,543 chickens. All these figures, except for cattle, showed declines from the 1930 census.

**Manufactures.**—The leading manufactures, according to the U.S. census of 1935, were meat packing, flour, petroleum refining, railroad cars and equipment built in shops, butter, foundry and machine shop products, bakery products, cement, feeds, and printing with 1,508 establishments producing goods valued at \$468,690,290. The annual average of bituminous coal mined for 1926–30 was 3,215,000 tons. This represents a decline from 5,204,380 for 1919. The low point was reached in 1932 with 1,953,000 tons with the 1935 figure standing at 2,686,164 tons worth \$4,943,000. The major portion of the State's 1935 mineral output of \$96,905,947 was made up of petroleum (\$56,750,000) and natural gas (\$18,153,000). (J. C. MN.)

**Kazakh S. S. R.,** in area the second largest Republic of the U.S.S.R. (*q.v.*), stretches between the lower Volga and the Caspian sea in the west, China in the east, the R.S.F.S.R. in the north, and the Central Asiatic Soviet republics, Turkmenistan, Uzbekistan, and Kirghizistan in the south. The capital is Alma-Ata, and the national flag has a red ground, with a gold sickle and hammer and the name of the Republic in Kazakh

and Russian in the top left corner. Leading cities, with 1935 populations, are: Alma-Ata (formerly Verny), 197,400; Semipalatinsk, 136,400; and Karaganda, 118,900.

**Area and Population.**—Area: 2,744,000 sq.km. Population (1933); 6,797,000 (rural 5,626,000, urban 1,171,000), of whom Kazakhs form 57.1%, Russians 19.7%, and Ukrainians 13.2%. The main languages spoken are Kazakh, Russian, and Uzbek. In 1936–37, the total number of pupils was 930,000 in 7,903 schools; and there were 21 higher educational institutions, and 85 technical colleges.

**History.**—The adoption of a new Constitution by the 10th Extraordinary Soviet Congress in Alma-Ata on March 26, 1937, made Kazakhstan, formerly an autonomous Republic belonging to the R.S.F.S.R., an equal, independent Union Republic of the U.S.S.R. The Kazakhstan S.S.R. is divided administratively into 8 provinces.

Ninety-six per cent of the population took part in the elections to the Supreme Council of the U.S.S.R. on Dec. 12, 1937.

**Trade and Communications.**—Sown area (1936): 21,053 square miles. In 1937, 97.5% peasant households were collectivized. The chief agrarian products are grain, rice, cotton, and sugar beets; and cattle are bred. The natural resources include coal, oil, copper, lead, zinc, gold, and silver. The retail trade turnover (1936) was 2.3 milliard roubles, and the output of industry (1936—at prices 1926–27), 604 million roubles. There are three important railway lines: Semipalatinsk-Tashkent in the south-east; Petropavlovsk-Kounrad in Central Kazakhstan. Aktyubinsk-Tashkent in the west. The length of railways (1936) was 5,228 km.; and the freight carried, 18,356,000 tons.

(S. YAK.)

**Kellogg, Frank Billings** (1856–1937), former World Court judge and U.S. secretary of State, was best known for his part in securing adoption of the multilateral peace pact of 1928. His activity as Government prosecutor, U.S. Senator from Minnesota, ambassador to Great Britain and secretary of State are described in the *Encyclopædia Britannica*, vol. 13, p. 316. After retiring from the secretaryship in April 1929, he received the Nobel Peace Prize for 1929 and in 1930 was appointed as a judge on the Permanent Court of International Justice at The Hague where he served until his resignation in 1935. His death occurred in St. Paul, Minn., Dec. 21, 1937.

**Kellogg, Vernon Lyman** (1867–1937), American zoologist, was born at Emporia, Kan., Dec. 1, 1867. After four years on the staff of the University of Kansas, he became professor of entomology at Stanford University where he formed a close friendship with Herbert Hoover with whom he was associated during the World War. He remained in Pasadena until 1920 when he became permanent secretary of the National Research Council. He resigned from this post because of illness in 1931 and died Aug. 8, 1937, at Hartford, Conn. A brief account of his life and a list of his publications may be found in the *Encyclopædia Britannica*, vol. 13, p. 316.

**Kellogg-Briand Pact:** see NEUTRALITY: *Kellogg-Briand Pact*.

**Kentucky,** an east south central State of the United States, admitted June 1, 1792, popularly known as the "Blue Grass State," area 40,598 sq.mi.; population (U.S. census, 1930) 2,614,589; estimated (July 1, 1937) 2,920,000. Capital, Frankfort, 11,620; the largest city, Louisville, had 307,745 inhabitants (1930). Of the State's population, 799,026 were urban or 30.6%, 2,366,524 were white, 236,040 coloured, and only 21,841

foreign born.

**History.** — Normally Democratic in politics, Kentucky returned only one Republican to the national congress in 1936 and the State legislature of 100 members stands 77 to 23 on joint ballot. Chief officers: Governor Albert B. Chandler; Lt. Governor Keen Johnson; Attorney General H. M. Meredith; Education, H. W. Peters; Agriculture, G. K. Ferguson. A

drastic Reorganization Act of 1936 consolidated scores of administrative boards under three groups: Constitutional (seven), Statutory (ten), Independent Agencies (five). Under the last is a Legislative Council to prepare legislation for the General Assembly which meets biennially.

A great flood in the last week of Jan. 1937 filled the valley of the Ohio and its tributaries. Fifty-four counties sustained property damage of \$139,800,000 and 50 lives were lost. Severe losses occurred in Covington, California, Louisville and Paducah. The Kentucky river also inundated the obsolete State reformatory at Frankfort compelling the hasty transfer of 2,800 convicts to new buildings later provided at La Grange. A new asylum for the feeble minded is planned in Mercer county in a program of improvement of charities and correction.

Since 1933 the floating debt (constitutional debt limit \$500,000) has been reduced from \$26,000,000 to \$11,000,000, with indications of its elimination in 1939. The annual budget exceeds \$24,000,000, exclusive of \$15,000,000 annually administered by the Department of Highways. On Jan. 1, 1938, despite the prestige of distilleries, 43 counties had voted to exclude the sale of intoxicants by virtue of the State law of Feb. 25, 1936. Labour troubles were insignificant except for attempts of the United Mine Workers to organize the Harlan district. Federal juries investigated reports of intimidation and indicted certain persons.

**Education.**—Educational progress included the consolidation of weaker units both primary and secondary; abolishing graduate study in the four State teachers' colleges in favour of the university at Lexington. Illiteracy declined from 12.4% in 1920 to 8.6% in 1930.

**Agriculture, Manufactures, Mineral Production.**—Tobacco is the chief crop, yielding in 1935, 243,587,600lbs., marketed at \$22.50 per hundredweight. Corn from 238,000 farms yielded 62,084,000 bushels. The yield of both crops was somewhat less in 1936. The Kentucky race-horse, noted for speed and endurance, flourishes in the Blue Grass counties where large establishments are devoted to his care. The livestock census reported in 1935, 1,211,508 cattle; 1,034,991 swine; 240,196 mules; 1,079,655 sheep.

Manufacturing is located chiefly in the Ohio river cities, and in distilleries and mills widely scattered over the State. In 1935 the U.S. census returned 39 distilleries with 2,647 workers producing \$48,583,000 in value; 137 flour mills with 876 workers; 10 repair shops, 29 meat packing establishments, and 8 petroleum refineries,—each group averaging about \$16,000,000 in value of output.

Of the varied mineral resources, which include rock asphalt, sand, clays, and building stone, the chief commercial product was coal, whose reserves are estimated at 123,000,000,000 tons. In 1936 the coal industry employed 58,494 men, producing 47,694-

ALBERT B. CHANDLER, governor of Kentucky, and Mrs. Chandler

862 tons. Petroleum lifted was 5,506,281bbls.; and natural gas (estimated for 1937) 37 billion cubic feet. (E. T.)

**Kenya,** a British crown colony and protectorate in East Africa, bounded N. by the Anglo-Egyptian Sudan and Ethiopia, E. by Italian Somaliland, S.E. by the Indian ocean, S.W. by Tanganyika territory and Lake Victoria, and W. by Uganda. The governor is Air Marshal Sir H. R. M. Brooke-Popham, K.C.B., C.M.G., D.S.O., who succeeded Brig.-Gen. Sir Joseph Aloysius Byrne in April, 1937. The capital is Nairobi. Total area 224,960 sq.mi. (the protectorate is a small coastal strip at the mouth of the Tana, rented from the sultan of Zanzibar); pop. (est. 1935) 3,084,351, of whom Europeans numbered 17,997, Asiatics 39,898, and Arabs 12,599. The leading towns are Nairobi, Mombasa, and Kisumu. In 1936 16 missions had 1,397 elementary, 40 primary, and 2 secondary schools, with a total of 95,642 pupils. The Government had also 11 primary and 38 village schools, one native Industrial Training Depot, and one Jeanes school (mainly for teachers' practice), with a total of 4,520 pupils.

In April, 1937, a bill was passed imposing an income tax for the first time in the colony's history. Defence proposals put forward in October included the creation of a mine-sweeping unit and the equipment with new weapons of the King's African Rifles.

The total value of imports during 1936 was £7,377,279; exports of the territories were valued at £8,354,774, goods to the value of £3,888,321 originating in Kenya. The main products are sisal, tea, wheat, and coffee. Gold was the most important mineral, the output being valued at £269,947.

The radio telephone service to Great Britain was inaugurated in 1936 and later extended to the continent of Europe. Work has been begun on three new trunk telephone services, and three short trunk services have been opened. Funds have been obtained from the Colonial Development Fund for roads in mining areas, and work was begun in 1936. There is a twice-weekly air service by Imperial Airways to Kisumu and Nairobi. Currency is controlled by the East African Currency board in London; the unit being the shilling, subdivided into 100 cents. There is a native poll-tax. Revenue for 1936 was £3,496,389, and expenditure £3,350,381. Kenya has a native regiment, a battalion of the King's African Rifles, with regular British officers, and also an African police force.

**Kidnapping.** While the crime of kidnapping is not confined to the United States, the number of cases in recent years and the efforts of the State and Federal governments to prevent its continuance have attracted special attention to the American problem. Progress was made in apprehending kidnappers and increasing penalties during 1937, but several sensational abductions proved that much remained to be done.

The year began with world interest aroused by the search for the captor of Charles Mattson, ten-year-old son of a Tacoma, Wash., physician, who had been seized while playing under his Christmas tree. Efforts of the family to contact the kidnapper were unavailing, and when the battered body of the boy was found on Jan. 11, Federal investigators were free to undertake a relentless search for the killer. The year passed, however, without apprehension of the culprit.

The efficiency of the Federal Bureau of Investigation's work was fortunately not to be judged by the failure to locate the murderer of Charles Mattson. Indeed, it was during the search that J. Edgar Hoover, head of the bureau, reported that 65 cases of kidnapping and kidnap plots had been solved since the Federal kidnapping law of June 22, 1932 had provided for national participation. In four years, 158 convictions had been obtained (four death sentences, 31 for life and the remainder for a total of

2,114 years) and three notorious cases of 1935-36 (the kidnappings of George Weyerhaeuser, Mrs. B. V. Stoll and Edward Bremer) had been solved with convictions.

While no other case of 1937 matched the grimness of the Mattson kidnapping, Federal authorities had to deal with several other instances of abduction. In early February the kidnapper of Dr. J. C. Davis of Willow Springs, Mo., was apprehended soon after he had lured the 67-year-old country physician to his death by a false call for medical aid. In June Mrs. William H. Parsons disappeared from her Long Island home; and although a ransom note was found, the mystery remained unsolved. Dr. James I. Seder, 79-year-old West Virginian, died of exhaustion in November after escaping from his captors who were quickly arrested and convicted; while in December an Indiana baby and nurse were released by frightened kidnappers after being seized.

Another 1937 case was solved in Jan. 1938, when John Seadlund was seized at the Santa Anita race track betting ransom money received from the family of Charles S. Ross, Chicago merchant who had been kidnapped in September. Seadlund's confession that he had killed both Ross and a confederate marked the climax of painstaking Federal investigation.

Federal action against kidnapping was supplemented by State action. The legislation most frequently suggested was a compulsory death penalty which was discussed in Pennsylvania, Georgia, New Hampshire, Connecticut, Rhode Island and Colorado. A different approach was the prohibition of ransom payments urged by Senator Ashurst of Arizona and debated in the States of Massachusetts and Washington. The danger of mandatory death penalties was made clear by the frequent instances of children seized by divorced parents or love-starved women. Firm action in all cases, however, seemed the only way of discouraging kidnapping attempts.

Outside of the United States the leading kidnapping case of 1937 was the abduction and murder of two-year Eugenio Pereyra Iraola, son of an Argentine cattle rancher, in late February. His confessed kidnapper committed suicide soon after capture. Elsewhere seven Canadians were released after pleading guilty to seizing an employer and transporting him to the United States border and French authorities were urged to investigate the disappearance of General Eugene Miller who disappeared in August leaving a note saying he feared abduction.

**Kiel Canal.** As a further step in the renunciation of the provisions of the Treaty of Versailles for the international regulation of inland waterways, Germany, on Jan. 16, 1937, resumed full sovereignty of the Kiel canal. According to the new regulations published by the Naval High Command, the passage of the warships and naval craft of foreign Powers through the canal is permissible only with authorization obtained beforehand through diplomatic channels.

Plans have also been announced for boring a tunnel 1½ mi. long and 10 ft. wide, under the canal, to take a new Reich motor road from Hamburg to Flushing on the Danish-German frontier.

**Kieselguhr:** see DIATOMITE.

**King, William Lyon Mackenzie** (1874- ), Canadian statesman, was born at Berlin—now Kitchener—Ontario, Dec. 17, 1874, the son of John King and Isabel Grace, daughter of William Lyon Mackenzie, M.P., who had been prominent in the struggle for political freedom in 1837. Mr. King entered Parliament in 1908, became leader of the Federal Liberal party in 1919 and has continued as leader since. He resumed office as Prime Minister for the third time, Oct. 23, 1935.

On March 5, 1937, Mr. King made a friendly visit to President Roosevelt at the White House, Washington. He headed the Canadian delegation to the coronation of King George VI, and Queen Elizabeth, May 12. At the opening of the Imperial Conference at London on May 14, Mr. King declared himself in favour of peace and freer trade. After the Imperial Conference ended on June 15 he visited Aberdeen, Scotland and later officiated at the inauguration of Canada's World's Fair Pavilion, Paris, June 23. On a journey to Germany, Mr. King met Chancellor Hitler on June 29, and on July 1, King Leopold of Belgium.

As Prime Minister of Canada he announced that his government would join in the parley on the Nine-Power treaty of 1922 with respect to the situation in the Far East; that any expenditures on armaments were for the defense of Canada and not for defense of the British Empire; and on Nov. 18, that negotiations would be opened for a revised Canadian-United States reciprocal trade pact in the light of the proposed new Anglo-American trade agreement. (J. T. C.)

**Kingsley Dam:** see DAMS.

**Kirghiz S. S. R.,** a Central Asiatic Soviet republic, a member of the U.S.S.R. (*q.v.*) bordering on the republics of Kazakhstan, Uzbekistan, and Tajikistan, and in the east on China. The capital is Frunze (formerly Pishpek), and the national flag has a red ground, with the name of the republic in Kirghiz and Russian in gold in top left corner. Leading cities, with 1936 populations, are: Frunze, 86,300; and Kizil-Kiya, 13,500.

**Area and Population.**—Area: 197,000 sq.km. Population (1933): 1,302,000 (rural 1,100,000; urban 202,000), of whom 66.6% were Kirghiz, 11.7% Russians, and 11% Uzbeks. The chief languages spoken are Kirghiz, Russian, and Uzbek. In 1936-37, the total number of school children was 227,000, and there were 1,600 elementary schools, 167 secondary schools, three higher educational institutions, and 14 technical colleges.

**History.**—The adoption of the new Kirghiz constitution by the Fifth Extraordinary Soviet Congress in Frunze on March 23 brought to the formerly politically and economically backward republic an important change in its status in the Soviet Union. Until 1924 a part of Kazakhstan, and later an autonomous republic of the R.S.F.S.R., Kirghizstan now takes the position of an equal independent Union Republic of the U.S.S.R. It includes 45 districts, five towns, and three workers' settlements. Ninety-four per cent of the population took part in the elections to the Supreme Council of the U.S.S.R.

**Trade and Communications.**—Sown area (1936): 3,837 sq.mi. In 1937, 89.1% peasant households were collectivized. The chief agricultural products are grain (chiefly wheat), cotton, tobacco, sugar-beet, and poppy; and there is important stock-breeding. The natural resources include coal, gold, non-ferrous metals, radium, sulphur, oil, mercury, and water-power. The retail trade turnover (1936) was 0.5 milliard roubles. The output of industry (1936, at prices 1926-27) was 114 million roubles. There is a lack of railways and other means of transport, the length of railways (1936) being only 162 km. (S. YAK.)

**Kiwanis International.** Combined membership in the 1,936 Kiwanis clubs in as many communities in the U.S. and Canada was approximately 97,000. Membership is limited to two men from any one business or profession or from agriculture in any one community. The headquarters of the organization are Kiwanis International, 520 North Michigan avenue, Chicago, Ill. The international officers for the 1937-38 term are: president, F. Trafford Taylor, K.C.,

**Knitwear:** *see* TEXTILE INDUSTRY.

**Agriculture, Manufactures, Minerals.**—Korea is overwhelmingly an agricultural country and over 80% of its population is

**Ku Klux Klan.** The hooded brotherhood organized by Southern whites in 1866 as an influence against negroes after the Civil War was revived by Walter Joseph Simmons on Thanksgiving Day 1915 as an "invisible empire" of 100 per cent Americans determined to apply extra-legal pressure not only upon the coloured population but upon Jews and Roman Catholics. On Stone mountain, Atlanta, Ga., the fiery cross was rekindled. For some years, the activities of the 20th century Klan were spectacular and provocative of controversy, instances of violence and intimidation being described in the press. The alleged membership of the Klan during post-war hysteria was

said to run into large figures. It did not prevent, however, the nomination of Alfred E. Smith, a Roman Catholic, as Democratic candidate, in 1928, nor the election of Herbert H. Lehman, a Jew, five times elected Governor of New York State. Feeling was aroused, however, when in 1937, President Roosevelt appointed Senator Hugo L. Black of Alabama as Associate Justice of the Supreme Court. After the approval of the appointment by the Senate, it was stated that the new Justice was or had been a Klansman. Early in October, Mr. Black's published statement was, "I joined the Ku Klux Klan about 15 years ago." Later he resigned and never rejoined. With regard to an unsolicited card of membership given to him shortly after his election to the Senate, he said, "I never used it. I did not even keep it." Applications to exclude Justice Black from the Supreme Court on constitutional grounds failed. (See also SUPREME COURT OF THE UNITED STATES.)

**Kuomintang.** The Kuomintang (National People's Party), the ruling party in China, came into existence on Aug. 23, 1912, in the year after the establishment of the Chinese republic. It was founded as an open political party and grew out of the secret nationalist revolutionary organizations which had been working for the overthrow of the Imperial régime. Its outstanding leader was Dr. Sun Yat-sen, whose so-called Three Principles have constituted the political creed of the Kuomintang both during Sun Yat-sen's life and after his death in 1924. These Principles were Nationalism, Democracy and People's Livelihood, the last of the three being the vaguest as to definition. Without committing the party to dogmatic socialism, it apparently calls for a certain amount of State planning for popular welfare. Democracy, in Sun Yat-sen's conception, was to be introduced in China not immediately, but after two preliminary stages, a period of military rule, when reactionary elements would be eradicated, and a period of "tutelage," during which the masses of the people would be educated to a point where they could effectively carry on a democratic form of government.

On Jan. 26, 1923, Dr. Sun Yat-sen and Adolf Joffe, Soviet special envoy in China, jointly announced the conclusion of an agreement, according to which Russia would support China "in achieving unification and attaining full national independence." The joint statement declared that conditions for the successful establishment of communism or sovietism do not exist in China. The Kuomintang became the sole ruling party in China after the northward campaigns of the nationalist forces, starting from Canton, in 1926, 1927 and 1928.

During this period the alliance with the Communists was smashed and the latter were outlawed. The Kuomintang has been criticized on two grounds; exclusion of non-members from responsible posts in the State service and loss of revolutionary vitality after the sharp swing to the Right in 1927. As Chiang Kai-shek (*q.v.*) has emerged more and more definitely as China's national leader the first criticism has tended to lose validity, as Chiang displayed considerable independence in making appointments regardless of party affiliation.

Plans for a national constitutional convention, which might have broadened the basis of government in China, have been indefinitely postponed because of the hostilities with Japan. The fate of the Kuomintang seems to depend largely on the issue of these hostilities, as Japanese Army leaders have been bitterly opposed to the Kuomintang and suppress it wherever they acquire control. (See also CHINA.)

## Kylsant, Owen Cosby Philipps,

1ST BARON of Carmarthen, (1863–

1937), G.C.M.G., British ship-owner; born March 25. In 1902 he was appointed chairman of the Royal Mail Steam Packet Company, around which the Kylsant group of shipping lines became centred. (For an account of this group, see *Encyclopædia Britannica*, vol. 20, p. 559, *s.v.* SHIPPING LINES AND GROUPS.) Lord Kylsant's connection with shipping ended unfortunately in a sentence of 12 months' imprisonment for circulating a false prospectus, but he was the victim of circumstances and the slump, and his personal reputation suffered little. He had been M.P. for Pembroke and Haverfordwest, 1906–10, as a Liberal, and for Chester, 1916–18 and 1918–20, as a Unionist. He was created a G.C.M.G. in 1918, and in 1923 was raised to the peerage. In 1902 he married Mai Morris, C.B.E., and is survived by her and three daughters. The peerage became extinct at his death. He died June 5, 1937.

**Labor, Department of:** see GOVERNMENT DEPARTMENTS AND BUREAUS.

**Labour.** Over the world as a whole the level of production and employment continued to advance rapidly during the

**BOMBS,** concealed in parcels and sent to two French employers' associations, wrecked this building and killed two policemen in Paris, Sept. 11, 1937

# ABOUT

greater part of 1937. In every important country the numbers of workers recorded as employed were substantially higher in 1937 than they had been in the corresponding months of 1936, though in many countries they were still considerably below the numbers employed in 1929, before the beginning of the world slump. The relevant figures for a number of countries are given in the accompanying table, which, taking 1929 as its base, represents the volume of employment by means of an index number. The average for the year 1932 is given in order to show the fall in employment during the world slump; and figures are added for the latest available month in 1937 and for the same month in 1935 and 1936, in order to show the extent of recovery as apart from seasonal fluctuations.

Of course, the increase in employment does not involve a corresponding decrease in the numbers unemployed, as population has increased, and in most countries the occupied population has risen somewhat faster during the past few years than the population as a whole. But the International index of unemployment (1929=100) compiled by the International Labour Office, which stood at 291 in 1932, had fallen to 95 in June, 1937, or actually below the 1929 level. This is slightly misleading, as the 1937 figure has not been adjusted for seasonal variation. In June, 1936 the corresponding index figure was 137, but the adjustment raised it to 151. The adjusted figure for June, 1937 should be about 105—rather above the pre-slump level.

In the latter part of 1937 a recession began to develop in the United States, partly on account of the Government's retrenchments in public expenditure and partly on account of the dislike of big business for President Roosevelt's policies. The American index of industrial production (1923-25=100) fell from 122 in May to 109 in September 1937, and that of factory payrolls from 105 to 100. The recession in the United States reacted on stock exchange conditions and on investment in Great Britain, and the level of unemployment rose in the autumn and early winter, the rise being spread over most industries except those affected by the rearmament program. The decline in employment, however, was not large; and in general the demand for labour remained high, though on account of the persistence of bad conditions in the depressed mining and textile areas, registered unemployment was at about 1,500,000 in November 1937. In October the percentage unemployed in different regions ranged from 21% in Wales and

PICKETS BREAKING WINDOWS in an automobile plant during a strike in Flint, Michigan

16% in the Northern region to 7% in the Midlands, 6½% in the South-east and 6% in London. The great activity in the heavy industries in connection with rearmament had, however, considerably decreased unemployment on the Clyde and in the North-east and South Wales as compared with a year earlier.

Among the outstanding causes of the world recovery in employment, the following seem to be the most important; the improvement of conditions in the United States—itsself largely due to the restoration of purchasing power through the outpouring of Government money under the New Deal; the bettered purchasing power of the primary producing countries owing to the higher prices of foodstuffs and materials—itsself influenced by the increase in American demand as well as by harvest conditions and the stimulus given by rearmament; the intensive rearmament in most of the European countries and in Japan; and the great impetus given to gold production and to the purchasing power of the gold-producing countries, especially South Africa and the Soviet Union, by the high price of gold. To these must of course

CHICAGO POLICE break a window to enter a factory and end a sit-down strike by evicting the strikers

THE BRITISH TRADES UNIONS, representing 4,000,000 workers, hold their annual Congress in St. Andrew's Hall, Norwich, Sept. 6 to 10, 1937

be added the impulse to build up depleted stocks of commodities at all stages of production and to put arrears of maintenance and construction in hand during the early phases of an expansionist movement; and also—a factor of very great importance—the readiness of Governments and central banks to keep the supplies of credit abundant and prevent interest rates from rising as a consequence of expanding demand.

Thus, United States imports, which had fallen from a monthly average of \$362,000,000 in 1929 to one of \$110,000,000 in 1932, rose to \$296,000,000 in March 1937. Then came a decline; but imports were still at \$234,000,000 in September of 1937, as compared with \$218,000,000 a year before, and \$169,000,000 in Sept. 1935. The American index of prices of primary products (Sept. 1931=100) rose from 84 in July 1932 to 200 in March 1937. Thereafter, it fell sharply to 139 at the end of November; but there had not been time by the end of the year for this fall to react seriously on the purchasing power of the primary producing countries, which had ample liquid funds in hand.

British prices of primary products fluctuated less, the indices for the corresponding dates being 102, 182, and 145. But it was obvious, by the end of 1937, that the American recession could not continue for long without serious repercussions on the

rest of the world, even if these repercussions took some time to become manifest.

In Great Britain especially the level of economic activity in 1937 was influenced by the coincidence of rearmament activity with the continued boom in building. This boom, based mainly on low interest rates, reached its peak in the middle of 1937 when the index for building activity as a whole (1929=100) reached 210, and for industrial buildings only 241. Thereafter activity fell off; but it was still at 156, for building as a whole in July 1937, after which there was some further decline, but not very much beyond the normal seasonal variation. It was, however, regarded as certain that house-building would fall no further, in the absence of a new Government housing scheme on a large scale; for the demand for houses of the types which private enterprise was prepared to erect without subsidy was nearing saturation point in many areas. Flat-building, however, still remained active, and so did industrial building in connection with rearmament and the building of garages, cinemas, and other amenities in the newer residential districts. Nor was it certain whether the factory-building phase of rearmament had yet reached its peak. In general, building activity was expected to fall, but not precipitately, during 1938.

Over the entire period from 1929 to 1937, the most important single factor in employing additional labour in Great Britain has been the growth of the distributive trades. If 1923 is taken as 100, the index for the number of workers in these trades rose to 136 in 1929 and to 162 in 1932. After 1932 the increase became small. The index was 163 in 1935, 166 in 1936, and 167 in 1937 (July). The rapid advance of these trades has been largely due to the movement of population to new districts, as a result of the migration of industry and of rehousing in suburban areas—new shops being opened much faster than old ones have been closed. But this expansion seems now to be reaching its limit; and this has an important bearing on the future level of employment. Between 1923 and 1937 the distributive trades absorbed 807,000 additional workers, whereas all manufacturing industries taken together absorbed only 485,000.

Over the same period, building and public works construction absorbed 485,000, transport 119,000, and the "services", including public utilities, Government and commerce, 560,000. Mining reduced its personnel by 374,000; and there was a contraction of 437,000 in the relatively depressed textile and metal industries (which are also included above in the manufacturing group). The total increase for all insured occupations was 2,211,000.

Thus in Great Britain the occupational distribution of the employed population has been changing rapidly in recent years. In 1923 manufactures employed 51% of the insured workers, in 1937 only 47%. Mines and quarries accounted for 11½% in 1923 and only 7% in 1937. On the other hand, transport and distribution rose from 18% to nearly 22%, and building and public works from 7 to nearly 10. Services, apart from transport and distribution, rose from 12 to 14%. Agriculture, which is not included in these figures, underwent a continuous decline in the number employed, despite the protective measures applied to it during the slump.

These occupational changes connote a considerable increase in the proportion of black-coated workers. Moreover, within the group of manufacturing industries, there has been a big shift from old to new trades; and this has usually meant a decrease in the proportion of heavy to light industries, and of skilled to less-skilled workers. The largest increases have occurred in the finishing trades serving the consumers' market and in the electrical equipment trades as a result of the construction of the "grid." In 1937 this movement of labour into the lighter trades was to some extent reversed by the activity of the metal and heavy engineering

ing trades as a consequence of rearmament; but the rapid development of mechanization in the steel industry prevented the growth of output from causing any large increase in the demand for labour. Heavy engineering, being less susceptible to mechanization, did make considerably greater demands for skilled workers.

In general, the shift to new industries and to less skilled types of labour has been unfavourable to the growth of trade unionism, which has hitherto had its chief strength in the industries using a high proportion of skilled workers. In Great Britain, trade union membership fell from about 5,000,000 in 1927, after the general strike, to 4,389,000 in 1933. There was then some advance as industry gradually recovered from the slump; and total membership rose to 4,842,000 at the end of 1935. By the end of 1937, it was probably about 5,500,000—approximately the same as in 1925, but considerably less as a percentage of the occupied population. A beginning has been made in organizing the workers in the newer mass-production industries; but these workers, who include a high proportion of women and move fairly easily from one industry to another, are not easy to organize, as they have not the same continuous interest in conditions in one particular occupation as the skilled workers in the older trades.

In the United States, however, a determined attempt was being made in 1937, to unionize the workers in the mass-production industries—steel, automobiles, rubber, chemicals, etc. American trade unionism, under the control of the American Federation of Labor, has hitherto been organized for the most part strictly on a craft union basis, and has failed to enrol the workers in these industries, who have either remained unorganized, or been enrolled in “company unions” under the auspices of the big firms. In 1936, certain big unions belonging to the A.F. of L., headed by the United Mine Workers and the Amalgamated Clothing Workers, formed the Committee for Industrial Organization, and set out to organize the mass-production industries on industrial union lines. This led to a split, the A.F. of L. finally expelling from membership the unions which adhered to the C.I.O. The C.I.O., favoured by the New Deal legislation against company unionism, forged ahead rapidly, under the leadership of John L. Lewis of the mine workers; and important victories, including recognition of the C.I.O. unions as well as wage advances, were won, especially in the steel and automobile industries. By the end of 1937, the C.I.O. had gone a long way towards destroying company unionism, and its membership exceeded that of the unions which remained faithful to the A.F. of L. Many big employers, however, were waiting for a chance to hit back, and the stability of the C.I.O. unions was still uncertain. In face of the common danger and opportunity, attempts were being made late in 1937 to achieve a reconciliation between the two wings of the American trade union movement, but without much hope of success. (See also AMERICAN FEDERATION OF LABOR; COMMITTEE FOR INDUSTRIAL ORGANIZATION; SIT-DOWN STRIKES; STRIKES AND LOCK-OUTS; UNITED STATES: *Labour*.)

In France, as a sequel to the formation and election victory of the *Front Populaire* and to the fusion of the two rival Trade Union Federations in 1936, there has been an even more remarkable growth of trade union strength. In March 1936, the *Confédération Générale du Travail* (the French Trades Union Congress) had about 1,300,000 members. A year later its affiliated membership had risen to more than 5,000,000. Membership rose in the building and woodworking trades from 65,000 to 540,000, in the metal trades from 50,000 to 775,000, and in the food and drink trades from 15,000 to 300,000. Among textile workers it increased from 47,000 to 300,000, and among clerks and shop assistants from 1,500 to 285,000. These immense increases were the outcome of the great spontaneous movement, among organized and unorganized workers alike, for the 40-hour week and the full

recognition of the rights of collective bargaining. As a consequence the 40-hour week was introduced in most of the major industries in 1936, or the early part of 1937, and trade union recognition was conceded in the great majority of trades and establishments. Up to the end of 1937, these concessions had been for the most part successfully held, despite the replacement of a predominantly Socialist Government by that of M. Chautemps, which was predominantly Radical. The employers argued that the high costs involved were hampering economic recovery; but after a difficult period in the early part of 1937, the French index of employment began at last to move slowly upward.

In the Fascist countries trade unionism remains in any real sense non-existent; for both the Fascist trade unions in Italy and the German “Labour Front” are rather means of disciplining labour in the service of the totalitarian state than of enabling the workers to express their grievances or to establish any control over the conditions of employment. The strength of trade unionism is concentrated in the democratic countries. Late in 1937, an attempt was being made to unite for anti-Fascist action the two rival trade union Internationals—the International Federation

†Not including the new unions organized under the C.I.O.

of Trade Unions, based chiefly on the British, French, American, and Scandinavian unions, and the Red International of Labour Unions, which is based on the Russian movement. The accompanying table sets out the strength and affiliations of the trade union movement in the leading countries as it was in 1936—figures for 1937 not being yet available. The table includes, where figures are available, unions of other types, such as the Christian unions which exist in many Continental countries, and organizations of black-coated workers or others unconnected with the national trade union centres.

(G. D. H. C.)

**Labour Arbitration.** The outstanding development in industrial arbitration in the United States during 1937 was the validation by the Supreme Court on April 12 of the National Labor Relations Act—the so-called Wagner Act of 1935. Aiming to promote collective bargaining as a means of preventing strikes affecting inter-State commerce, the law prohibits defined practices as managerial interference with employees' rights to choose representatives for collective bargain-

ing. A board of three, administering the act, is empowered to determine and certify those representatives under the principle of majority rule. Thus this law seeks peaceful settlement of that issue—union recognition and collective bargaining—responsible for both a growing proportion and the most violent of industrial conflicts, and peculiarly unsuceptible to traditional methods of arbitration.

The real test of its efficacy, however, is only now under way. For in the two and one-half months immediately following the Supreme Court decision, the board received more complaints than in the 18 months preceding.

To Dec. 1, 1937, a total of 10,568 cases, involving 2,848,166 workers, were handled, of which 7,076, or almost two-thirds had been closed. Of these 7,076 cases, 4,127, or 58.3%, were closed by agreement of both parties; 1,031, or 14.6%, were dismissed; and 1,538, or 21.7%, were withdrawn. Only 380 cases, or 5.3%, were closed by other procedures, including the compulsions authorized by the act. Although the act does not expressly authorize mediation, the great majority of cases were thus settled actually "out of court," by quasi-mediatory procedure. The board apparently realized that settlements achieved by consent promised far smoother industrial relations than decisions enforced from without.

**United States Department of Labor.**—The Wagner Act is restricted to the single issue of employee representation for collective bargaining in disputes affecting inter-State commerce. Obviously it needs supplementation. The conciliation service of the Federal Department of Labor, established in 1913, intervened during the fiscal year 1937 in 1,267 industrial disputes, involving 1,383,588 workers, or nearly one-third of the year's total of 3,619 strikes. Adjustments were obtained in 1,016 cases. Inadequate to the full potentialities of such a service, the strengthening of this Federal agency is one of the important present needs.

**State Legislation.**—For intra-State industry nine States enacted legislation during the year to protect labour's rights to organize and bargain collectively, and to strengthen conciliation services. Five States—Massachusetts, New York, Pennsylvania, Utah and Wisconsin—passed "Baby Wagner Acts," modelled, with some deviations, on the Federal law. Thus Massachusetts prohibits "sit-down" strikes, New York and Wisconsin prohibit industrial espionage and the circulation of blacklists, and Pennsylvania excludes labour organizations which deny membership because of race, creed, or colour. Wisconsin also authorizes its board to conciliate or arbitrate industrial disputes, to consider complaints concerning violations of agreements, and to register labour organizations. In addition, panels of employers and union representatives are established, each to consider unethical practices and breaches of agreement rising respectively from its own group. Four States—Connecticut, South Carolina, Pennsylvania, and New York—strengthened their laws for mediation and arbitration through other agencies.

**Railway Industry.**—The Railway Labor Act of 1934 represents the culmination of a long experience with orderly labour relations, and of experimentation with various forms of government intervention in an industry in which continuous service is an obvious public necessity. Collective bargaining between the carriers and unions designated by the majority of a craft or class of employees, constitutes the foundation. A National Railroad Adjustment Board composed of representatives of both sides handles grievances arising under existing agreements. A National Mediation Board of three members handles representation cases; intervenes in deadlocks over the negotiation of new contracts concerning wages, rules, or conditions; seeks to persuade the parties to accept voluntary arbitration when its mediation fails; and, as a final recourse, reports to the President the existence of emergen-

cies threatening substantial interruptions of service, in which event an emergency board appointed by him reports within 30 days. Strike action must be postponed for 30 days after the report.

During the fiscal year 1937, the mediation board disposed of 101 representation cases and 158 disputes arising from the negotiation of contracts. The adjustment board disposed of 1,443 cases involving grievances under existing agreements. Three emergency boards achieved settlements. Against the background of general turbulence in industry, and of economic difficulty confronting the railroads, this constituted an impressive record of orderly relationships. Nevertheless two strikes and two minor stoppages occurred. The most serious of these, a strike on the Louisiana and Arkansas Railway System, occurred only after the procedure under the act had been exhausted. After nine weeks, the government of Louisiana intervened, and, assisted by an agent of the mediation board, persuaded the company to accept decisions reached through the machinery of the act.

**Intervention.**—The year brought some notable instances of intervention by prominent officials. Outstanding was that by the governor of Michigan, assisted by conciliators from the Federal Department of Labor, whose unremitting efforts from the beginning of the automobile strikes, promoted agreements—one between the General Motors Corporation; and the other between the Chrysler Company, on the one hand, and the United Automobile Workers of America, on the other—recognizing the union as the collective bargaining agency for its own members. Intervention in the "little steel" strikes, however, proved unavailing against the relative ineffectiveness of the strikes and the antagonistic union attitude of the companies involved. Collective agreements were sought similar to that signed with the U.S. Steel Corporation. But neither the Federal conciliation service, nor the special mediation board of three members appointed by the President on July 17, nor the supporting efforts of the governors of the States involved, were able to bring the two sides into joint conference. The strike was regarded as a defeat for labour; cases involving such issues are now before the National Labor Relations Board.

Thus the year 1937 turned a dramatic page in the continuing effort to promote orderly labour relations in industry through Government intervention. The years ahead project the real test of present machinery in the United States for that end—machinery embodying experiments with legal protections to organize collective bargaining, as well as the more traditional procedures of mediation, conciliation and arbitration. These methods received their trial amid some of the most significant developments in history—changing Government policy toward labour and business; huge unionization campaigns in mass-production industries, and the internecine struggle within the ranks of labour itself. Difficult as it is already, the task of all arbitration machinery, Federal and State, has been rendered much more complicated by the split between the American Federation of Labor and the Committee for Industrial Organization, and the competition among all unions for whatever their affiliation, for membership and the right to represent labour. (See also LABOUR UNIONS; UNITED STATES: Labour)

(B. M. S.)

**Great Britain.**—Although there were more industrial disputes in Great Britain than in any year since 1920, the smoothness with which adjustments in working conditions were generally made affords further evidence of the effectiveness of the various forms of joint machinery, and of the resolve of the organizations of employers and workpeople to use constitutional methods of settlement. One of the most spectacular disputes of the year was that of the London busmen in May. This was settled through the intervention of the conciliation department of the Ministry of Labour and the men returned to work without the concession of the principal demand, but with considerable over-hauling of the

schedule duties. Many stoppages of work which occurred throughout the year were of an unofficial nature; that is, the men ceased work without or against the advice of officials of their unions. (See LABOUR UNIONS: *Great Britain and Europe*.) (VI. BR.)

**Labour Legislation.** Important as 1937 was in the enactment of new labour legislation in the United States, the year was still more significant for decisions of the highest court upholding existing labour laws. These court opinions upon minimum wage, collective bargaining, prison labour, and old age and unemployment insurance, not only determined decisively the validity of legal intervention which had long been held in question, but also by their liberality opened the way for further extensions of State and national protection. The new labour laws of this year therefore acquire additional interest and significance.

Among the many important labour laws enacted during 1937, the most notable relate to labour relations, minimum wages, hours, child labour, industrial health and safety, social insurance, and labour law administration. Labour relations acts patterned after the Federal law and outlawing specified unfair labour practices, with State boards for enforcement, were adopted in Massachusetts, New York, Pennsylvania, Utah, and Wisconsin. Mediation and conciliation laws were strengthened in New York, Connecticut, Pennsylvania, South Carolina, and Wisconsin. Elimination of abuses involved in the use of industrial police, deputized sheriffs, strikebreakers, or detective agencies was sought in laws enacted by Illinois, Massachusetts, Pennsylvania, and Utah. Pennsylvania and Wyoming further restricted labour injunctions. Massachusetts, Tennessee and Vermont enacted laws against sit-down strikes. Utah required all labour organizations to register with the State industrial commission.

Minimum wage laws were enacted for the first time by Nevada, Oklahoma, and Pennsylvania; and Arizona and New York re-enacted such laws following the Supreme Court's favourable decision on the Washington law. The Nevada act is a flat-rate law, and the Oklahoma law covers both men and women. Strengthening amendments to minimum wage laws were adopted in Colorado, Connecticut, Minnesota, and Wisconsin. By the end of 1937, minimum wage laws existed in 22 States and the District of Columbia. In hours legislation, Pennsylvania led by enacting an 8-hour day, 44-hour week covering men as well as women and children, with certain exemptions. North Carolina fixed a 10-hour day, 40-hour week for men and a 9-hour day, 48-hour week for women and minors. Washington limited to 60 the hours of domestic employees. An 8-hour day, 48-hour week limit was fixed for women in Connecticut (mercantile), Ohio (45-hour week in manufacturing), Illinois, and Nevada. Hour limits for women were also lowered in New Hampshire, North Carolina, and Vermont, and extended in coverage in Arkansas, New York, and North Dakota. Night-work for women was prohibited in Wyoming. The coverage of one-day-of-rest-in-seven laws was broadened in Illinois, New York, and Pennsylvania.

The child labour amendment to the Federal Constitution was ratified in 1937 by Kansas, Kentucky, Nevada, and New Mexico. The Kentucky ratification, however, was invalidated by that State's highest court in October. In all, 27 States (not including Kentucky) had ratified this amendment by the end of 1937. Missouri, New York and Vermont prohibited the sale of child labour products from other States. The minimum age limit for child labour was raised to 16 in North and South Carolina. Pennsylvania raised the compulsory school attendance age to 17 years beginning in 1938 and 18 years in 1939. (See also CHILD LABOUR AMENDMENT.) Wisconsin fixed an 8-hour day and 40-hour week limit for minors from 16 to 18 years of age, and also declared

A NEW STYLE of collar for the American workman, as seen by Cecil Jensen in *The Wilmington News*

newsboys to be employees of the publisher or news agency. Power to exclude minors from hazardous employment was delegated to labour departments in Connecticut and North Carolina. Arkansas and Colorado adopted laws governing apprenticeship, and Congress provided for the promotion of apprenticeship standards through the Federal Labor Department.

Modern restrictive industrial homework laws were adopted in Massachusetts and Pennsylvania, and such work was also regulated by laws adopted in Illinois and Texas. More effective regulation of fee-charging employment agencies was sought in laws enacted in Arizona, Maryland, Pennsylvania, and Texas. Improved industrial safety and sanitation laws were enacted and rule-making powers delegated to the State labour department in Arkansas, Florida and West Virginia. In eleven States, mine safety laws were strengthened or extended in coverage; and in Arkansas and Pennsylvania laws on the appointment of mine inspectors were revised. Boiler codes were adopted or amended in five States; a compressed air safety code was enacted in Washington, and an elevator safety code, in Michigan.

Workmen's accident compensation laws were amended in five States—Delaware, Indiana, Michigan, Pennsylvania, and Washington—to protect occupational disease victims. In Indiana such coverage was made all-inclusive, but on an elective basis; in the other four States, it was limited to specified diseases. There are now 27 American laws providing compensation for occupational diseases—14 with all-inclusive and 13 with "limited-list" coverage.

Many other liberalizing changes were made in the workmen's compensation laws of a total of about 35 States. Benefit scales were raised in New Mexico and South Carolina; the weekly maximum was increased in Georgia, New Hampshire, New Mexico, and Pennsylvania; and the weekly minimum was liberalized in Connecticut, Florida, Mexico, Ohio, Pennsylvania, and Vermont. The time limit on payments for total disability and to widows was abolished in Pennsylvania, and the total amount payable was increased in Georgia and Maryland. Waiting periods were short-

ened in Florida and South Carolina. Medical benefits were increased in a half-dozen States. Florida provided for double compensation to minors injured while illegally employed. Indiana and Maine created commissions to study the desirability of a State insurance fund. Pennsylvania made the cost of workmen's compensation administration a charge on insurance carriers and employers.

With adoption of new unemployment compensation laws in 12 States, and the Territories of Alaska and Hawaii, this legislation has now been extended to all of the States and Territories. The new State enactments in 1937 were in Arkansas, Delaware, Florida, Georgia, Illinois, Kansas, Missouri, Montana, Nebraska, Nevada, North Dakota, and Wyoming. In addition, about 30 other States strengthened existing laws by amendments. Validity of State and Federal unemployment compensation legislation was sustained by the Supreme Court in two sweeping decisions in May. Wisconsin completed its first year of benefit payments in July, and 22 additional States prepared to begin payments early in 1938.

Old age pension or assistance laws were adopted for the first time in seven States in 1937—Georgia, Kansas, New Mexico, North Carolina, South Carolina, South Dakota, and Tennessee. This left only Virginia without such a law. About 25 States amended their existing laws to conform with the Federal Social Security Act's provisions, to liberalize pension payments, or to strengthen administrative procedure. By August 1937, nearly 1,500,000 persons were receiving such assistance under the laws of 47 States, the District of Columbia, Alaska and Hawaii.

A revised plan for contributory old age retirement annuities for railway workers was adopted by Congress, following an adverse court ruling on the tax features of the 1936 legislation. The national old age insurance or benefit system set up in the Federal Social Security Act was launched by the beginning of tax collections for this purpose in January. This provision of the Act was held constitutional by the Supreme Court in May. Massachusetts enacted a law to discourage the use of maximum age limits in industry, and New York created a commission to study the problem of the older worker.

Although in most States administration has been placed in existing State departments, new departments for the administration of unemployment compensation or other social security legislation were created in Arizona, Delaware, Missouri, Montana, Washington, and Wyoming. Labour relations or mediation boards were provided in Massachusetts, New York, Pennsylvania, and Wisconsin. State labour departments were extensively reorganized in Arkansas, Georgia and Indiana, and significant changes were also made by law in the labour departments of Florida, Michigan, Pennsylvania, South Carolina, and Tennessee. In Congress legislation was pending at the end of 1937 for the reorganization of Government departments.

(J. B. AN.)

**Great Britain.**—In Great Britain the great industrial law of 1937 was the Factories' Act, which received the Royal Assent on July 30, and was the most important legislation of its kind since 1901. The act will control in detail the condition in which all factory work in Britain is done, and, for women and young persons, the maximum number of hours they may work on any day or in any week, and the maximum number of hours overtime in excess of the standard they may work in any year.

The act controls the lighting of factories, their ventilation and temperature. There are approximately 167,000 factories and 73,000 workshops on the registers of the Home Office. The new act, which comes into force in July 1938, abolishes the distinction between factories and workshops, and between textile and non-textile factories, and brings within its scope certain classes of premises hitherto excluded, including men's workshops to which overcrowding restrictions have hitherto not applied. The factory

inspectorate is to be considerably increased because of the complexity and scope of the new act. It was in the committee stage of the bill that it was decided that, after July 1, 1939, the weekly hours to be worked by young persons under 16 should be reduced to 44, but the home secretary has power to increase the hours to 48 if an industry can show that it will be seriously prejudiced if the labour of the under-sixteens were to be thus limited.

The earliest hour at which work for women and young persons may start was changed from 6 A.M. to 7 A.M., and for young persons under 16 the latest finishing hour was changed from 8 P.M. to 6 P.M.; normal working hours for women and young persons becomes 48 a week against 60 ( $55\frac{1}{2}$  in textile factories); there is a daily limit of 9 working hours against  $10\frac{1}{2}$  (10 in textile factories); and there must be no work after 1 P.M. on Saturday. Employment beyond 48 hours a week is not permitted for young persons under 16, but overtime employment for women and young persons above 16 is permitted up to 100 hours in a calendar year for women only the 100 hours may be increased to 150 in industries liable to seasonal or other pressure. (VI. BR.)

**Labour Party.** The most important developments in the British Labour party in 1937 were the adoption of the party's new "Immediate Program" and the revision of the Constitution so as to give greater weight to local labour parties in comparison with trade unions. The local parties will in future have seven, instead of five, representatives on the Party Executive (as compared with twelve from the trade unions and one from the miscellaneous affiliated bodies). Moreover, where the actual election has hitherto been made by the whole Conference, so as to give the trade union "card vote" the preponderance in the choice of local as well as trade union members, the local labour parties and the trade unions will in future choose their own representatives. This change was the outcome of considerable friction inside the party. It was strongly pressed for by an unofficial Association of Constituency Labour Parties, of which Sir Stafford Cripps was chairman. This body, having secured the desired change, seems now to have suspended operations, the party executive having promised to institute machinery for more effective consultation of the local parties, especially by means of regional conferences. It was part of the settlement, reached at the Bournemouth Conference in October 1937, that no further change should be made in the Party Constitution for three years.

The Party Conference rejected proposals for a united front with the Communist party and Mr. Maxton's Independent Labour party, thus in effect upholding the action of the executive in expelling the Socialist League earlier in the year for participation in the "United Front Campaign." The Socialist League had then upon dissolved; but at Bournemouth, Sir Stafford Cripps and Prof. H. J. Laski, both leading advocates of the united front, were elected to the executive by the local labour parties under the revised Constitution.

The new short program (or immediate program) of the labour party differs from earlier programs in being not inclusive but selective. Its intention is to include only such measures as an incoming Labour Government could expect to be able to deal with during its first period of office, or within the life of a single Parliament. It includes public ownership of the Bank of England (but not of the joint-stock banks), and of certain key industries (coal, electricity, gas, railways), co-ordination of transport services under public control, powers of easier land acquisition for public purposes, and public control over the location of industry in the interests of the distressed areas. It declares again a return to the gold standard, and for an adjustment of taxation designed to secure a better distribution of wealth. Special emphasis is laid on the need for increased food production with

ew to improved nutrition, a living wage for landworkers, and narrowing of the margin between wholesale and retail food prices. The program includes a scheme of improved invalidity pensions and retiring pensions for elderly workers, the effective raising of the school age to 15 (and later to 16) with maintenance allowances, a new Workmen's Compensation Act, and the abolition of the Means Test. In international policy, it declares strongly for a system of collective security under the League of Nations, and pledges a Labour Government to maintain armed forces adequate to implement this policy, and to democratize and improve conditions in the armed forces. At the Conference the Party also adopted a special statement on the rearmament question (also approved by the Trades Union Congress) declaring in favour of adequate defence measures, but insisting that armaments should be an instrument of a policy of collective security, and not a means to isolation. Party membership rose during the year, both in the trade unions and in the local labour party section. Trade union affiliated membership now exceeds 2,000,000, and individual membership in local parties is approximately half a million. (See also POPULAR FRONT. For United States see SOCIALIST PARTY.) (G. D. H. C.)

**Labour Unions.** The year, 1937, was one of the most eventful in the history of trade unionism in the United States. In that year total membership of unions reached all-time peak, surpassing 1920. Union agreements were made with several of the largest corporations and substantial parts of non-union industry were organized. The law governing trade unions was strengthened by decisions of the United States Supreme Court establishing the constitutionality of the National Labor Relations Act. The split in the organized labour movement was widened and deepened by the aggressive tactics of the Committee for Industrial Organization (C.I.O.) and the retaliatory measures employed by the American Federation of Labor (A.F. of L.). During the first half of the year strikes were numerous and prolonged and wages and working conditions were substantially advanced.

**The C.I.O.**—Foremost among the factors contributing to the spread of labour organization were the activities of the C.I.O. Political Committee, formed in Nov. 1935 by 10 unions affiliated with the A.F. of L. to encourage the organization of industrial unions in the basic industries and to demonstrate the feasibility of unionizing American workers, promptly launched extensive organizing campaigns throughout all classes of industry. Efforts

to compose the differences between the C.I.O. and its parent body failed. In Aug. 1936 the unions affiliated with the C.I.O. were suspended from membership in the A.F. of L. This action was followed by the intensification of the warfare between the two factions. The C.I.O. extended its jurisdiction into fields claimed by constituent unions of the A.F. of L., notably in the electrical manufacturing, lumber, metal, and local transportation industries and among maritime and clerical employees. In prosecuting its organizing campaigns, the C.I.O. created a nationwide staff of organizers, recruited largely from among experienced officials of established unions. Substantial funds for financing these activities were contributed largely by the three most powerful unions in the C.I.O.—the United Mine Workers, the Amalgamated Clothing Workers, and the International Ladies Garment Workers.

These campaigns of the C.I.O. met with unusual success. By the middle of 1937, unions affiliated with the C.I.O. had won contracts with the General Motors and Chrysler companies, the United States Steel Corporation, nearly all of the large companies in the rubber tire industry, and with a considerable number of firms in the textile industry. In New York the C.I.O. union of Transport Workers was recognized by the major subway and bus systems of the city. Among maritime employees groups affiliated with the C.I.O. which had earlier won almost complete control over the unions on the Pacific coast extended their control to the Atlantic coast and in the process destroyed the old International Seamen's union affiliated with the A.F. of L. At its first convention held in Atlantic City, Oct. 1937, the C.I.O. claimed that the number of unions affiliated with it had, in two years, increased from 10 to more than 30 and their combined membership from something more than 1,000,000 to nearly 4,000,000.

**Political Activity.**—Together with these advances in the field of union organization, the C.I.O. undertook to promote and organize independent political action by labour. Through the Labor's Non-Partisan League, composed of both A.F. of L. and C.I.O. unions but generally regarded as an arm of the C.I.O., the Committee participated actively in the municipal and State elections of 1937. In some places, the League put up candidates of its own and in others threw the weight of its support to one of the two old parties. Although these newly organized labour groups suffered bad defeats in the crucial elections in Detroit, Michigan, and Akron, Ohio, they polled a substantial vote and in some places, notably the industrial towns of Pennsylvania, the candidates named or endorsed by the C.I.O. were elected. The greatest victory earned by labour was in New York city where the political organization of the trade unions, the American Labor Party, polled an unexpectedly large vote and succeeded in electing a large proportion of the membership of the new city council. Although the American Labor Party includes both C.I.O. and A.F. of L. unions, it is substantially a C.I.O. organization.

Meanwhile the A.F. of L., at first stunned by the defection of several of its largest unions and the loss of 1,000,000 dues-paying members, set out to overtake its rival and recover its losses. Assisted by favourable business conditions, the resentment of those unions whose jurisdiction had been invaded by the C.I.O., and by the more friendly attitude of employers, the Federation began also to make considerable gains. At the annual convention held in Oct. 1937, the executive council reported that the number of members withdrawn by the C.I.O. unions had been more than made up by gains in other directions and that total membership amounted to 3,270,000. In the autumn of 1937, then, the aggregate membership of the C.I.O., the A.F. of L. and the independent railroad brotherhoods exceeded 7,000,000 and was 2,000,000 greater than the previous maximum of 5,000,000

Y, HOW THE CAT HAS GROWN!" Development of the wildcat strike, among  
sted Automobile Workers, as pictured by Minge in *The Detroit News*

reached during the business boom of early 1920.

In the advances made by organized labour during the year, the state of business, the tactics employed by the C.I.O., and decisions of the courts bearing on the law of trade unions played a determining rôle. Beginning roughly in the early months of 1936, American business had one of the largest and most sustained recoveries since 1933. Prices, wages, and employment rose. Margins of profits widened and the outlook for a further rise improved. Amid the prevailing uncertainties of the whole post-depression period, employers, fearful of stoppages and loss of orders, were inclined to make concessions. The unions, consequently, by calling strikes or threatening to do so, took advantage of these favourable conditions and managed to wrest union agreements from a substantial number of employers in a great variety of industries.

**Supreme Court Decisions.**—At the same time the position of unions was strengthened by the clarification of the basic national trade-union law. The National Labor Relations Act, signed by the President, July 5, 1935, had been promptly challenged by employers, and the board, created by the Act, had become involved in prolonged litigation. As long as the meaning of the law and the powers of the board remained in doubt, the law had been ineffective. On April 12, 1937, the United States Supreme Court delivered five decisions on cases in the steel, clothing, automobile, newspaper, and bus transportation industries, establishing the constitutionality of the Act and sustaining the powers of the National Labor Relations Board. These decisions which affirmed the right of Congress to regulate labour relations in manufacturing industries added directly and indirectly to the power of organized labour. In a short while the law was invoked by unions all over the country and many employers, now faced by the stringent terms of the Labor Relations Act, withdrew their opposition to labour organization and began to bargain with one or another union.

**The Sit-Down Strike.**—Probably the most potent weapon employed by organized labour in this period was the sit-down strike. This device, whereby groups of workers (often a relatively small minority) occupied a plant and held it until they had brought the employer to terms, was most extensively used by the C.I.O. By means of this type of strike union agreements were made with the Goodyear Rubber Co., General Motors, Chrysler, and with many smaller firms. The disrepute into which the use of this weapon brought local agencies of law enforcement and the rising resentment of employees unwillingly thrown out of work produced a hostile public opinion and soon forced the abandonment of the sit-down strike. But during the short period in which it was used, it proved the most effective weapon of the C.I.O. and the source of its most spectacular victories.

The climax of the strength of organized labour was reached in the summer of 1937. By that time the influence of increasing wages and costs, the reactions of the public and unorganized labour to the sit-down strike, and the disturbances associated with the conflict between the A.F. of L. and the C.I.O., began to make themselves felt in the more stubborn opposition to unions by employers. In a test of strength between the steel workers' union of the C.I.O. and several of the largest independent steel companies, involving long and costly strikes and widespread violence, the steel companies refused to yield or to submit the issues to a mediation board appointed by the President, and the union, apparently unable to win the support of the majority of the steel workers, was forced to call off the strike. This major defeat and the turn in business conditions which became noticeable by the end of the summer, resulted before the year was over, in a considerable decline in union membership and prestige. These same factors also produced great pressure on the leaders of the two fac-

tions in organized labour to end their quarrels and to restore unity to the labour movement. Peace conferences between committees representing the C.I.O. and the A.F. of L. were accordingly begun in Washington on October 25, 1937. But the conflict had apparently inflicted wounds too deep to cure and on December 20, peace negotiations were abandoned. (See also AMERICAN FEDERATION OF LABOR; COMMITTEE FOR INDUSTRIAL ORGANIZATION; LABOUR ARBITRATION; LABOUR LEGISLATION; SIT-DOWN STRIKES; STRIKES AND LOCK-OUTS.)

**BIBLIOGRAPHY.**—Leo Wolman, *Ebb and Flow in Trade Unionism* (National Bureau of Economic Research, New York, 1936); *Union Membership in Great Britain and the United States* (Bulletin 68, National Bureau of Economic Research, New York, 1937); Robert R. Brooks, *When Labor Organizes* (Yale University Press, 1937).

(L. Wo.)

**Great Britain and Europe.**—Membership of all British trade unions increased during 1937 to 5,307,689 (801,775 women), which over 75% were affiliated to the trades union congress. Industries, excepting certain textile organizations, shared in the rise of membership, which continued during 1937. Substantial increases were shown by unions in the metal, machine-making and vehicle-building trades, transport (including railways) and general labour, coal-mining, national and local government, building, and distribution.

Growth in membership during 1937 was the common experience of almost all the other national trade union movements affiliated to the International Federation of Trade Unions, including the American Federation of Labor, which became affiliated during the year. New affiliations and expansion of the movement in many countries raised the total membership to 20,000,000, and this largely offset the loss of membership sustained by the International Federation of Trade Unions in earlier years through the destruction of the unions in Italy, Germany, Austria, and elsewhere. Negotiations were also opened for the affiliation of the Russian trade unions.

British unions, at the beginning of 1937, had a total income of £7,628,000, accumulated funds aggregating more than £16,000,000. A substantial reduction in expenditure on unemployment benefit was a feature of the year's work; expenditure on trade and friendly benefits, an integral feature of trade-union service, does not vary much from year to year. Excluding unemployment benefit, the unions in 1936 spent £2,623,000 on superannuation, funeral, sickness, accident, and other benefits to members.

**Collective Bargaining.**—Union negotiations during the year continued the upward trend of wage rates which became evident in 1934, and a total of approximately £750,000 in weekly full-time wages of about 5,000,000 workpeople was added during 1937. A large proportion of these wage increases were obtained by direct negotiation of unions with employers, and others took effect under arrangements made by trade boards, or other joint standing bodies, and under sliding scales based on selling prices. An average reduction of about 2½ hours per week in hours of labour affecting approximately 400,000 workpeople was reported during the year. No large-scale trade dispute was reported, excepting the stoppage of work by engineering apprentices, which led to an agreement with the engineering employers' federation to recognize the engineering unions in negotiating conditions for apprentices and young persons in that industry; and the stoppage of London busmen, which was settled on terms representing important concessions by the London passenger transport board to union claims. Trade disputes, involving approximately 600,000 workers, caused a loss of about 3,500,000 working days; this was somewhat higher than the respective total of disputes, workers involved, and working days lost in 1936.

**International Labour Standards.**—At the 1937 international labour conference at Geneva trade union representation secured

the passage of a convention for the 40-hour week in the textile industry. Draft conventions were also discussed in contemplation of reduced hours in the printing and chemical industries, but these failed to obtain the necessary majority of votes. At the 1938 conference there is to be a discussion on the general 40-hour week for all industries. Reduction of working hours to a standard of 40 per week was the objective of trade-union negotiations during the year. In some organized trades progress was made, and it was estimated that in 1937 about 1,750,000 workpeople in Great Britain had secured by collective agreement a maximum working week of 44 hours.

By the same means holidays with pay were won during the year in Britain by important agreements, notably in the engineering trades, some sections of the distributive trades, the garment industry, some of the coal-fields, and certain branches of transport. The movements towards both a shorter working week and paid holidays for all workers were strengthened by reforms instituted in other countries. French trade unions, whose membership rose to 5,000,000 during 1937, were able to maintain the 40-hour week spread over five days, with slight modifications, but economic difficulties deferred the full application of the French law to certain depressed industries. New Zealand is another country where, under a Labour Government, the 40-hour week has been instituted by law. Holidays with pay are a legal right for all workpeople, manual and non-manual, in 22 countries, and in 14 other countries certain classes of workers have become entitled, under legislation, to paid holidays; but in Britain it is estimated that not more than 4,500,000 workpeople, about half of whom are manual workers, at present enjoy paid holidays.

In Britain, extension of trade-union organization among non-manual workers and the development of trade-union relations with other organized professions were a feature of 1937. Workers in local government service and in the nursing profession were brought more closely into association with trade-union organization through the establishment of a national advisory committee representing the trades union congress and unions catering for local government employees, and a similar body for the nursing profession.

Unions interested in the organization of nurses formed a federation during the year to promote trade unionism among them; and a charter was framed setting forth standard conditions in respect of hours of duty, overtime, annual leave, sick pay, superannuation, training, and amenities free from unnecessary restriction. (See also LABOUR; WAGES AND HOURS.) (W. M. CL.)

**Labrador**, the most easterly portion of North America, marching inland with the Canadian province of Quebec, and facing the Atlantic to the east; a dependency of Newfoundland; area, c. 115,000 sq.mi.; population (1935) 4,700, mainly Eskimos. There are no towns. The people are occupied in hunting and in the valuable cod, salmon, and other fisheries. There are about 50 postal stations, but no railways, roads, or regular air communications. For trade and financial statistics, see NEWFOUNDLAND.

**Lacrosse** continued its popularity in Great Britain, the United States and especially Canada during 1937. The significant development was the tremendous increase in the United States. Playing games with many of the teams of their Canadian neighbours, American colleges included the game as a varsity sport in athletic programs, additional clubs took it up and countless secondary schools added it to the sports curriculum. The national open lacrosse title passed from the hands of the Mount Washington Club to the Baltimore Athletic Club in a game at Baltimore, Maryland. Previously, the Mount Washington Club,

considered by North American observers as one of the finest in the sport, had won 33 consecutive games. Baltimore's triumph in the championship game was a sensational upset. Further laurels were won by Baltimore when the Baltimore City college annexed its third successive national interscholastic title by defeating the Brooklyn (N.Y.) All-Stars. It was the thirty-sixth straight victory for the Baltimore collegians. The University of Maryland clinched the national collegiate championship by vanquishing Penn State and also thereby finished its season unbeaten. The Maryland freshmen also were victorious in their title game with the Penn State first-year players. The United States Intercollegiate Lacrosse Association sponsored and managed a composite All-American team in a series of exhibition games in England during the summer. Players were chosen for the American ten from among the leading college stars, some of the club athletes and a few naturally talented stick-wielders. The American team met with a measure of success against some English opponents but found others too strong. The exhibition series wound up with the American squad having broken about even on games won and lost. The club teams playing in Canada, England and the United States all reported good seasons. (T. J. D.)

**La Guardia, Fiorello H.** (1882— ), mayor of New York city was born on the lower east side of Manhattan island, Dec. 11, 1882. His father, Achilles La Guardia, of Italian origin, was a United States bandmaster. His mother was Irene Coen Luzatti. At an early age, he was taken to Prescott, Ariz., where he passed through high school. When he was 15, he obtained employment on a St. Louis newspaper and he had youthful ambitions to be a jockey, a prize fighter and a ball player. His father died from eating Army beef and the boy was taken by his mother to Budapest where she had relations. From 1901-04 he was consular agent at the U.S. consulate at Budapest and Trieste. From 1904-06, he served as acting-American consul at Fiume where he was regarded as sympathetic to America-bound emigrants. His remarkable knowledge of languages enabled him to serve as interpreter on Ellis island, 1907-10, and he received a bachelor of law degree at New York university in 1910.

Always a registered Republican he was appointed deputy attorney-general by Gov. Whitman in 1915. In 1916, a picturesque campaign in New York city during which his speeches were multilingual, carried him into Congress as a progressive (1917-21). He voted for the World War and tried to get into the draft but was rejected for being too small. In Italy, he led a U.S.A. air squadron, being decorated for wounds sustained during crashes, and after Caporetto, he "stumped" Italy in the interest of fighting morale. In 1921, he was the first Republican in twenty years to be elected aldermanic president of New York. There followed ten years in Congress (1923-33) where he was frequently associated with Norris of Nebraska, La Follette of Wisconsin and Brookhart of Iowa. He opposed prohibition, tried to have Andrew Mellon impeached as secretary of the Treasury, obtained the removal of two Federal judges and fought pork barrel appropriations. In 1929, he was defeated for mayor by James J. Walker, but was elected in 1933 in a three-cornered fight. In 1937, he was re-elected by a plurality of 450,000 votes over Jeremiah T. Mahoney—a victory that shook Tammany Hall to the foundations.

Mayor La Guardia's activities during 1937 were not confined to his re-election campaign. In March, for example, he roused Germany to diplomatic protests when he attacked Chancellor Hitler in an address before the women's division of the American Jewish Congress. Locally he concentrated his attention on the speedy inauguration of a Federal housing program, the continuance of

Federal relief, and the protection of labour interests. The support of labour which assured his re-election was a result of his championship of the Federal child labour amendment, his desire for a complete unionization of New York workers, and his successful mediation in strike disputes.

**Languages.** In stating the number of speakers of any language, we have the difficulty not only of ascertaining the facts, but of interpreting them. Compromising as well as the facts allow, we may give the following table of the principal, and some other, languages with estimated numbers of speakers:

American Indian Languages . . . . .	500,000	Gaelic (Irish and Scottish) . . . . .	600,000
Arabic . . . . .	25,000,000	German . . . . .	80,000,000
Australian Aboriginal . . . . .	150,000	Gipsy . . . . .	500,000
Basque . . . . .	500,000	Greek . . . . .	5,500,000
Bengali . . . . .	50,000,000	Hindustani . . . . .	90,000,000
Bulgarian . . . . .	4,500,000	Hungarian (Magyar) . . . . .	20,000,000
Burmese . . . . .	7,000,000	Italian . . . . .	40,000,000
Chinese . . . . .	430,000,000	Japanese . . . . .	55,000,000
Czech . . . . .	8,500,000	Malay . . . . .	1,000,000
Danish, Icelandic, Norwegian and Swedish . . . . .	12,000,000	Oceanic (Polynesian and Melanesian) . . . . .	50,000,000
Dravidian Languages . . . . .	65,000,000	Persian . . . . .	10,000,000
Dutch . . . . .	10,000,000	Polish . . . . .	30,000,000
English . . . . .	180,000,000	Portuguese . . . . .	37,000,000
Eskimo . . . . .	30,000	Pushtu . . . . .	5,000,000
Esperanto . . . . .	100,000(?)	Rumanian . . . . .	16,000,000
Finnish . . . . .	3,000,000	Russian . . . . .	85,000,000
French . . . . .	45,000,000	Siamese . . . . .	5,000,000
		Sinhalese . . . . .	3,000,000
		Spanish . . . . .	65,000,000
		Turkish . . . . .	7,000,000
		Welsh . . . . .	2,000,000

**La Roche-Guyon Bridge:** see BRIDGES.

**Laszlo de Lombos, Philip Alexius** (1869-1937), naturalized British portrait painter, whose subjects included many leading figures of Europe, England and the United States. A native of Budapest, he was naturalized in 1914. He won numerous prizes for his portraits which included five presidents of the United States and such rulers as King Edward VII, Queen Alexandra, Emperor Franz Joseph, and Benito Mussolini. A brief account of his life may be found in the *Encyclopædia Britannica*, vol. 13, p. 736. His death occurred in London, Nov. 22, 1937.

**Latin America,** or Hispanic America, is that portion of America which derives its culture and institutions from the Hispanic nations of the Old World, Spain and Portugal, embracing 20 republics and Porto Rico; languages, Spanish; Portuguese, in Brazil; and French (officially), in Haiti. The area is approximately 8,050,000 square miles. Population (estimate 1937) 95,000,000. The people are white, mestizo, and Indian, with negroid elements predominant in the Dominican Republic and Haiti and prominent in Brazil, Cuba, and on the Caribbean coast. The largest cities are Buenos Aires, 2,388,645, third largest in America; Rio de Janeiro, 1,756,080; São Paulo, 1,167,862; and Mexico City, 1,028,068. The year 1937 saw in general an economic improvement, although the instability of the market for coffee, a major crop in most of the tropical countries, caused uneasiness. Politically, there were violent changes only in Bolivia and in Paraguay, although unrest existed in many of the coun-

tries. International relations were marked in general by a greater friendliness with the United States, the aftermath of the Buenos Aires Conference of 1936, and with each other, except for the sharp clashes along the Dominican-Haitian boundary and the continuation of the Bolivia-Paraguay and Ecuador-Peru boundary controversies (see CHACO; HAITI; PERU). Foreign trade showed considerable development in 1937 with the United States, the largest participant, increasing its proportion. Exports are, in the main, raw materials, especially tropical products, and wheat and meat products in Argentina and Uruguay, with petroleum an increasingly important item in several countries. Manufacturing is rapidly developing but is inadequate to supply domestic demands. The Roman Catholic faith is predominant in all the countries, with, however, a varying degree of relationships with the Roman Catholic Church itself. Education is generally inadequate but considerable advances are being made.

**BIBLIOGRAPHY.**—Charles Edward Chapman, *Republican Hispanic America: a history* (New York, 1937); Lewis Hanke (editor), *Handbook of Latin American studies: a guide to the material published in 1936* . . . (Cambridge, Mass., 1937). (L. W. BE.)

**Latter Day Saints:** see MORMONS.

**Latvia,** Baltic republic of north-central Europe, bounded N. by Estonia, S. by Lithuania and Poland, E. by Russia; member of the League of Nations. Capital, Riga (seaport; 385,063-1935). President, Dr. Karlis Ulmanis (1936; Premier 1934). National flag, a white horizontal stripe on red.

**Area and Population.**—Area: 20,056 sq.mi. (plus 5,339, in land water), divided into Vidzeme (Livonia), Kurzeme (Courland), Zemgale, and Latgale. Population (1935): 1,950,502; religions: Protestant (56%), Roman Catholic (24.5), Greek and Orthodox (14.5); 77% are Letts, 12% Russians. Towns: Liepāja (Libau, seaport; 57,098) and two others above 30,000.

State-aided education figures: (1935-36), 1,907 elementary schools, with 223,483 scholars; 122 secondary, with 22,022. In the Latvian university, Riga, there were 7,225 students.

**History, Trade, Finance, and Defence.**—Theoretically, the sovereign power of the people is represented by the *Saeima* (100 elected for three years by universal suffrage and proportional representation), which, in turn, elects the president; but in 1934 the Parliament was disbanded and power is concentrated in the Cabinet.

In June, Lord Plymouth of Great Britain visited Riga, and M. Munters, foreign minister, created a precedent in cordial relations with Soviet Russia by visiting Moscow.

Agriculture predominates, but though there is little mineral wealth, industrialization is advancing (metallurgical, textile chemical, foodstuffs products). The chief exports are timber, butter, and flax. Imports (1936): 122,000,000 lats (£4,880,000); exports: 138,000,000 (£5,520,000); Britain takes three-fifths.

Currency unit: (silver) lat (at par, 25.22 lats=£1). Budget (1936-37 estimate): 160,000,000 lats. Notes (Bank of Latvia fully covered): 43,000,000 lats.

Army (conscript; term of service, 12-15 months): 2,200 officers, 23,000 others; 80 aeroplanes; navy: 2 submarines, 4 other craft.

**Law and Legislation.** For Law and Legislation in the United States see CONGRESSIONAL LEGISLATION and STATE LEGISLATION.

**Public Statutes of the United Kingdom.**—In international affairs, the London Naval Treaty Act, 1937, gave legislative effect to a minor clause of the London Naval Treaty, 1936, which

deals with the procurement of an admiralty licence for the building and despatch of vessels of war.

In the region of national defence, the Defence Loans Act provided money for the rearmament policy of the Government; it enabled the Treasury to issue out of the Consolidated Fund from time to time during the five financial years ending March 31, 1942, sums not exceeding in the aggregate £400 millions for the defence services. The Air-Raid Precautions Act assists local authorities in developing protective schemes against air raids, much of the total cost being borne by the national exchequer.

The Regency Act is of considerable constitutional importance. It improves upon earlier and rather haphazard legislation by providing for a regency if the sovereign is under 18 years of age, or if certain specified officers of state certify that he is, by reason of infirmity of mind or body, incapable of performing the royal functions, or is, for some definite cause, not available for such performance. The regent is to be the person next in line of succession to the Crown, provided that he is a British subject of full age, and is domiciled in the United Kingdom and is not disqualified by the Act of Settlement, 1701-1702. If the illness does not amount to the infirmity just described, or in the event of absence or intended absence, the sovereign may delegate the royal functions to certain "counsellors of State." Provision is also made for guardianship of the sovereign during a regency and for incapacity of the regent himself.

Public health and welfare were treated in the following acts: The Public Health (drainage of trade premises) Act controls the discharge of trade effluents into sewers. The Physical Training and Recreation Act is a striking departure from the *laissez-faire* attitude towards athletics. It continues the existence of two national advisory councils which are to investigate and advise upon the maintenance and improvement of the physical well-being of the people by means of exercise and recreation. The councils are to appoint local committees and sub-committees with similar duties of review, examination, and report. The Board of Education may make grants in aid of local requirements. The Local Government Superannuation Act makes further and better provision for the payment of superannuation allowances and gratuities by local authorities and by certain statutory undertakers. The Act is of widespread interest in view of the great number of employees who are affected by it.

A similar enactment, the Local Government Superannuation (Scotland) Act, deals with Scotland. The Widows', Orphans', and Old Age Contributory Pensions (voluntary contributors) Act extends on a voluntary basis an Act of 1936 to men and women whose incomes do not exceed respectively £400 and £250 a year. The age of applicants during the first year after the Act must be under 55, and of applicants thereafter, under 40. Weekly contributions are to range from sixpence upwards.

As to trade and commerce, the Trade Marks (amendment) Act embodied many amendments of the laws relating to that topic. The Factories Act is chiefly a great consolidation of the Factory and Workshop Acts, 1901 to 1929, but among its 160 sections are also included some substantive amendments of this branch of the law. The Export Guarantees Act amends and consolidates the Overseas Trade Acts, 1920 to 1934. In order to encourage overseas trade, the Board of Trade may, with the consent of the Treasury, give to any person carrying on business in the United Kingdom financial guarantees in connection with the export to any country of goods, not being munitions of war. In general, the guarantees are limited to home-made goods. The amount of liability of the Board of Trade in respect of such guarantees is not to exceed £50 millions.

Much general assistance is given to farmers by the Agriculture Act, which assists them in increasing the fertility of their land,

secures them against any substantial fall in the price of oats and barley, raises the limit of the quantity of wheat in respect of which deficiency payments under the Wheat Act, 1932, may be made at the full rate, makes further grants for land drainage, and promotes the eradication of diseases of animals and poultry, establishing for that purpose a national service of veterinary inspectors.

In private law, the greatest change made by the legislature was the Matrimonial Causes Act. The English law of divorce exhibited some crying defects which had led to equally crying abuses. The grounds for divorce were so crabbed and so out of touch with modern ideas that artificial adultery was used as a mask for involving the jurisdiction of the divorce court in cases where there was in fact complete incompatibility of temperament or some more substantial reason for claiming a dissolution of marriage. Of these latter reasons the Act takes account by allowing either spouse to petition for divorce on the ground of (1) adultery, or (2) desertion for three years, or (3) cruelty, or (4) incurable unsoundness of mind after care and treatment for at least five years; and a wife is allowed to do so on the ground that her husband has been guilty of rape, sodomy, or bestiality.

The following restrictions are laid down: (i) Where adultery is proved, divorce will not be decreed if there has been connivance, condonation, or collusion on the part of the petitioner. (ii) No petition may be presented until three years have elapsed from the date of the marriage; but this may be relaxed in cases of exceptional hardship suffered by the petitioner or of exceptional depravity on the part of the respondent. (iii) The petitioner's own adultery or cruelty may prevent his or her success in the suit. The Act also deals with judicial separation, which is now obtainable on any of the grounds on which divorce may be decreed, subject to the like qualifications, except the restriction relating to the first three years of marriage.

New grounds for seeking a decree of nullity are also added. They are: (1) non-consummation of the marriage owing to wilful refusal of the respondent; (2) that at the time of the marriage there was on the part of the respondent (a) unsoundness of mind, or recurrent fits of insanity or epilepsy, or (b) venereal disease if it were in a communicable form, or (c) pregnancy by some person other than the petitioner. But in the cases under (2), the Court must be satisfied that the petitioner was, at the time of the marriage ignorant of the facts alleged; that proceedings were instituted within a year from the date of the marriage; and that marital intercourse had not taken place since the petitioner discovered the existence of the grounds for the decree.

Courts of summary jurisdiction are given wider powers in making separation or maintenance orders. The Summary Procedure (domestic proceedings) Act is another statute affecting private law. It makes several improvements in the application of this procedure to "domestic proceedings" (matrimonial disputes, bastardy, guardianship of infants) and in the regulation of the duties of probation officers. In such proceedings the Court is to include, so far as is practicable, a man and a woman; the public (except press representatives) are in general to be excluded from the hearing; and newspaper reports may publish no more than the names of the parties and witnesses, the grounds of the application, a concise statement of the charges and defences, legal points, and the decision of the Court. (See also DIVORCE.)

(P. H. W.)

**Lawn Tennis.** The lawn tennis season of 1937 began on January 6th, when Ellsworth Vines, former American singles champion, met Frederick J. Perry of England who had recently turned professional, at Madison Square Garden, New York. The contest was remarkable for the mediocre and dis-

appointing quality of play, and for the gallery, 17,630 persons, said to be the largest crowd ever to watch a game of tennis. The two players then left for a barnstorming tour of the United States which lasted four months.

The first of the four great national championships was held on January 27, at Sydney, New South Wales. Vivian B. McGrath, a 20-year-old Australian, became champion, defeating a newcomer to international play, John E. Bromwich, in five sets. With the veterans, Crawford and Quist, these players faced the United States Davis Cup team at Forest Hills, L.I., New York, on May 29, 30 and 31. Unfortunately both Quist and McGrath were ill and young Bromwich was unequal to the task of replacing them. Budge, Grant and Mako took part for the American side and won all five matches. Only a single set, taken by Bromwich from Budge, went to Australia.

The second national tournament of the year was the French championships held in Paris, from May 18 to 30. Tennis history was made when German stars won three of the five events. Cramm, the holder, refused to defend, but Henkel, his teammate proved an able substitute, defeating Henry W. Austin of England in straight sets in the finals, and winning the doubles with Cramm. The former Fräulein Krahwinkel, now married to a Dane and playing as Frau Sperling, defeated Madame Mathieu of France in two sets for the women's title.

The English championships at Wimbledon took place from June 21 to July 3, and were notable for American triumphs. Budge won the men's singles with the loss of only one set, to his teammate, Parker, in the semifinals. In the finals he defeated Cramm in three straight sets. The doubles resulted in a victory for Budge and Mako, who in the finals beat Hughes and Tuckey of the English Davis Cup team, in four sets. England's only victory came in the women's singles, Miss Dorothy Round capturing the title she held in 1934.

The German Davis Cup team won the European Zone finals and came to Wimbledon on July 17 to face the United States. On this, the last contest of this series, hinged possession of the Cup for 1937. Cramm won the first two sets after deuce had been called in each, but Budge rallied to even the match. Cramm led four games to one in the deciding set, but Budge pulled up to five all, and after six match points won the set, eight-six. The following week the victors challenged Great Britain for possession of the Davis Cup. Their victory was easy, for Hughes the best English doubles player was unable to compete, and Hare, the second singles man, was no match for either Parker or Budge. So for the first time since the French defeated the United States in 1927, the Americans won and the Davis Cup returned to the U.S.

The Wightman Cup matches, played annually between teams of women from the United States and Great Britain, were held at the West Side Tennis Club on August 20 and 21, and resulted in a one-sided victory for the home players, six matches to one. For the first time, however, an American title went to Germany when Cramm and Henkel defeated Budge and Mako in the doubles finals at the Longwood Cricket Club, Chestnut Hills, Mass., in straight sets. The fourth important singles tournament of the year was that of the United States at the West Side Tennis Club September 2 to 11. It resulted in a win for Budge who did not lose a set until the last round when he defeated Cramm in five sets, a match less close than the score indicated.

A remarkable performance was the victory of Señorita Anita Lizana on her initial visit to the United States in the women's singles. She did not lose a set to a strong field, and for the first time an American title went to Chile.

Budge was the player of 1937. His superiority over other amateur players was clearly proved. But the question of world supremacy in tennis remains unsettled.

Many observers believe Budge would today conquer Vines Tilden, Perry or any professional. This will not be ascertained until Budge chooses to become a professional. An open tournament, with both amateurs and professionals of the highest standing competing, seems as far away as ever, while the men who control tennis remain at the head of what was once a sport and has now become a huge commercial enterprise. (J. R. Tu.)

**Lead.** The nine chief lead-producing countries, with outputs in excess of 50,000 tons, supply about 90% of the world total, the remaining 10% being scattered among a large number of minor producers, only three of which, Italy, Poland and the United Kingdom, produce amounts in excess of 10,000 tons. World production declined 33% from 1929 to 1932, and in 1936 had recovered to 85% of the former high.

Division of these figures between the United States and the rest of the world (total ex. U.S.) shows strikingly the markedly greater extent to which the depression affected the lead industry in the United States, where the output declined 60% and has recovered to 58% of the former high, while the rest of the world declined only 18% and has regained the entire loss, with a small margin of excess.

World Production of Lead  
(In thousands of metric tons)

	1929	1932	1934	1935	1936
Australia . . . . .	177.3	189.2	205.3	220.5	200.6
Belgium . . . . .	62.2	61.5	66.7	67.0	69.2
Canada . . . . .	148.0	116.1	157.1	153.8	173.8
Germany . . . . .	97.9	95.2	120.0	122.3	139.1
India . . . . .	81.5	72.3	73.0	73.2	74.3
Mexico . . . . .	248.8	130.3	175.6	185.2	218.3
Spain . . . . .	133.3	109.8	74.9	70.8	46.6
U.S.S.R. . . . .	6.2	18.7	27.2	36.8	50.8
United States . . . .	624.2	251.7	300.2	336.8	362.9
World Total . . . .	1,756.8	1,179.7	1,365.8	1,422.5	1,499.7
Ex. U.S. . . . .	1,132.6	928.0	1,065.6	1,085.7	1,136.8

The United States is the largest producer, with 36% of the total in 1929, 21% in 1932, and 24% in 1936, followed by Australia, Canada, and Germany, these four countries accounting for two-thirds of the total. Marked increases over 1929 are found in the Soviet Union, Germany, Australia and Canada, although in 1936 Australia dropped below 1935; the chief decreases were in the United States, Spain, and Mexico. Among the minor producers there were relatively large increases in Italy and the United Kingdom, and decreases in Poland and France. Preliminary reports for 1937 indicate an increase in world output of about 12% over 1936, to which the major countries contributed as follows: Germany 19%; United States 14%; Australia 11%; Canada 9%; and Mexico 3%. There has been a large drop in Spanish production as a result of the civil war, and during 1936 the Loyalist Government took over the supervision of the mine in Jaén Province, which produce about two-thirds of the output, although work was continued under the management of the owners.

Consumption of lead in the United States is practically independent of both imports and exports, each of which amounts to less than 1% of the total. The Australian, Belgian, Canadian, Indian, Mexican and Spanish outputs are largely exported, there being a large surplus over local consumption demands; German production, although large, must be supplemented by imports which amount to 40-50% of the production, which is itself partly from imported ores. The United Kingdom has only a small home output, and depends on imports, largely from Empire sources.

In the field of technology, most of the interest is in the method of refining and desilverizing, particularly the continuous process for desilverization. (See also METALLURGY.) (G. A. Ro.)

tional tennis tournament for women

**League of Nations.** In December 1936 the Council dealt with the Turkish request, under Article 11, that the recognized rights of the Turkish populations of the Sanjak of Alexandretta should be guaranteed, in view of the approaching termination of the French Mandate over Syria, by the conversion of the Sanjak into an independent State. It approved an interim agreement providing for the despatch of three neutral observers to the Sanjak and the initiation of conversations between France and Turkey. These resulted in agreement, and on Jan. 27, 1937, the Council approved the main lines of a compromise settlement submitted by its rapporteur (M. Sandler) in agreement with the two parties, who, at the Council's May session, announced their acceptance of the settlement, which entered into force on Nov. 29, 1937, as a final solution of the question.

**Danzig.**—At its session in January the Council also adopted the report of its Committee of three requesting it to take note of the Polish representative's report on his endeavours to overcome the difficulties between the League High Commissioner and the Senate in Danzig. On February 18, Prof. Carl Burckhardt, a Swiss national, in succession to Mr. Sean Lester, who had been already appointed deputy secretary-general of the League, took up his appointment as high commissioner for a term of three years.

**Spain.**—On Dec. 12, 1936, the Council, at the request of the Spanish delegate, under Article 11 of the Covenant, considered the situation in Spain. It adopted a resolution recalling the duty of every state not to intervene in the internal affairs of another State, recommending the Non-intervention Committee to secure the effective fulfilment of the undertakings entered into, and authorizing the League's secretary-general to make available the technical organs of the League in regard to problems of a humanitarian character.

A competent delegation of the Health Committee was despatched to Spain.

Shortly before the May session of the Council, the Spanish Government requested that the situation in Spain should be placed on its Agenda, on the ground that documents captured from foreign prisoners at Guadalajara confirmed the presence of regular Italian military units in Spain, which constituted veritable aggression.

On May 29 the Council adopted a resolution regretting the development of the situation, but noting the entry into force of the International Control Scheme on April 19/20 and the discussions of the Non-intervention Committee regarding the withdrawal of non-Spanish combatants, and condemning the bombing of open towns and the employment of methods of warfare contrary to international law. The Spanish situation was considered once more in September, when the Spanish delegates protested, both in the Council and in the Assembly, against the continuance of the Non-intervention Agreement, claiming that it denied to the legal Government the right to obtain arms from abroad at a time when flagrant intervention in Spain and piracy in the Mediterranean were continuing on such a scale as to constitute aggression within the meaning of the Covenant. They also protested against the failure of the Nyon Conference to extend naval protection against pirates to vessels of the Spanish Government. The sixth Committee, to which the matter was referred, after long and difficult discussions, submitted a strong resolution to the Assembly referring to the presence of "veritable foreign army corps fighting on Spanish soil," and declaring that unless foreign troops were withdrawn, League members would reconsider their decision to continue the non-intervention policy. This resolution was supported by 32 states in the Assembly, but failed, under the unanimity rule, to secure adoption, owing to the adverse votes of Portugal and Albania. Fourteen states (mostly South American)

abstained. Finally, the Council adopted a resolution condemning piracy in the Mediterranean, and noting that the measures adopted at the Nyon Conference had proved effective. (See MEDITERRANEAN, THE; NON-INTERVENTION COMMITTEE; SPAIN.)

**Chinese-Japanese War.**—On September 12 the Chinese Government appealed to the League, invoking Articles 10, 11 and 12. This appeal was referred to the Far Eastern Advisory Committee set up in 1933 to follow the situation after the Manchurian conflict. China, Australia, Germany, and Japan were invited to participate; the two latter refused. The United States was represented by an observer. On September 29 the Assembly adopted a resolution, submitted by the Committee, condemning the bombing by Japanese aircraft of open towns in China. The Committee reports were adopted by the Assembly on October 6. The conclusion of the first was that Japanese action could not be justified on any grounds; the second recommended that efforts should be made to restore peace by agreement, and that the League should invite States-members, signatories of the Washington Nine-Power Treaty of 1922, to initiate the "full and frank communication" provided for by that treaty. The Assembly also adopted a resolution expressing moral support for China, and recommending members not to take any action calculated to weaken China's power of resistance and also to consider how far they could individually extend aid to China. The session of the Assembly was adjourned, not closed. Although on October 6, invitations were issued to States-members signatories of the Nine-Power Treaty it was decided that, in the hope of securing Japanese participation, the conference should not be held under League auspices; it opened in Brussels on November 3. (See NINE-POWER CONFERENCE.)

**Raw Materials.**—The 18th Assembly endorsed the conclusion of the report of the Raw Materials Committee, set up by the 17th Assembly, that while access was not seriously restricted, the availability of certain states to find the means to purchase raw materials was severely limited; the Committee suggested as a solution that every effort should be made to restore international exchanges on the widest basis. In December the Economic Committee drew up a report with a view to giving effect to these suggestions.

**International Trade.**—It recommended that raw materials should not be subject to any export prohibition or restriction except in pursuance of an international scheme; that they should not be subject to export duties, except those imposed as a uniform rate for revenue purposes; that foreigners should have the same facilities as nationals for developing natural resources everywhere; and that consuming interests should participate in the administration of international regulation schemes, which should provide them with adequate supplies.

The Assembly also adopted the Economic Committee's report, which noted the favourable effects of the tripartite monetary agreement of September 1936, and approved the suggestion that the existing system of quotas and exchange control should be relaxed and speedily abolished. It also requested the Economic and Financial Committees to pursue the study of the practical measures to increase international trade and facilitate the removal of exchange control, and to co-ordinate, in collaboration with the I.L.O. the examination of the following problems: improvement of the standard of living; the prevention of slumps; agricultural credit and insurance; factors affecting monetary systems; state and municipal indebtedness; fiscal evasion. It was decided to set on foot a study of demographic problems.

**Nutrition.**—The Mixed Committee of agricultural, economic and health experts submitted its final report to the 18th Assembly. Its general conclusions were that food habits in western communities had been tending to change in the right direction, and it

Increased demand had benefited agriculture. It examined the influence of price on consumption and the effect of improved production methods, commercial policy, and distribution costs on price. Malnutrition it found remained a serious threat to health. The Assembly, in adopting the report, emphasized the close relationship between nutrition and national income, and urged those Governments which had not yet done so, to set up National Committees on nutrition.

**Opium.**—The Assembly drew attention to the deterioration of the position in the Far East, and appealed to Japan to put an end to the clandestine manufacture of and illicit traffic in opium and drugs carried on by Japanese subjects in China. It attached great importance to the preparatory work, discussed by the Opium Advisory Committee in 1937, for a conference on the limitation of the cultivation of the opium poppy and of the production of raw opium to be held in 1940.

**Traffic in Women.**—In February a conference of Central Authorities in Far Eastern countries discussed at Bandung measures taken in the East to deal with the traffic in women and children. The Assembly requested the Council to take the necessary steps to carry out the Conference's recommendations for the establishment of a Bureau of the League in the Far East to receive and circulate information and co-ordinate action on this subject.

**Rural Hygiene.**—In August an Inter-Governmental Conference on rural hygiene in Far Eastern countries met at Bandung, and discussed the improvement of health and medical services, rural sanitation, nutrition, and measures for combating certain diseases in rural districts. (See also DRUGS AND DRUG TRAFFIC; MANDATES AND MANDATED TERRITORIES; REFUGEES.)

**League Budget.**—The 18th Assembly adopted the budget for 1938, amounting to 22,682,000 gold francs. The closed accounts for 1936 showed a net cash surplus of 5,592,101 gold francs. Current contributions from members to the 1936 budget represented 91.75% as against 88.25% in 1935.

**Composition of the Council.**—The League Council (1936-37) was composed of: United Kingdom, France, Italy, the U.S.S.R. (permanent members); Chile, Spain, Turkey (1934), Ecuador, Poland, Rumania (1935), Bolivia, New Zealand, Sweden, China, Latvia (1936) (members for three years). At the 18th Assembly, on September 20, Spain and Turkey failed to secure a vote for re-election, and Iran and Peru were elected; and on September 28 Belgium was elected to the Council.

**Changes in Membership.**—On February 19 Paraguay finally withdrew from the League; in August San Salvador, and in December Italy gave the necessary two years' notice of withdrawal. Egypt entered the League at an Extraordinary Session of the

Assembly on May 26, 1937. (See also CHINESE-JAPANESE WAR; DANZIG; IMPERIAL CONFERENCE; NEUTRALITY: *League of Nations*; REFUGEES.)

**Leather.** In seeking better definitions of quality and predictions of serviceability, leather technologists throughout the world are depicting clearer relationships between chemical composition, physical state, and fibre structure of leather and its strength, water resistance, wear and comfort. A novel "walking research," started in England, will include study of foot temperature while walking. Machine tests in America indicate that there may be 100% wear-variation in sole leather from even the best part of the hide.

The search continues for bookbinding, upholstery, belting, and bag leathers resistant to rot from acids absorbed from the air. Leathers entirely or partly chrome tanned are more permanent than vegetable tanned leathers. Longer lasting leathers can be

THE THREE MAIN BUILDINGS of the League of Nations are situated on a Mount of Honour; the Assembly in the centre, the Library at the right, the Council at the left and extending left from the Council, the Secretariat

obtained by addition of sodium chloride, lactate, or citrate, which serve as protective agents. In England protected leathers may be stamped accordingly.

Shortage of staple supplies has stimulated development of other sources of hides and skins. Russia is intensively studying the variety of leathers that might be made from domestic hogskins. Japan and Germany have enlarged facilities for collecting and tanning sharkskins.

A German method is claimed for making new leathers for gloves, shoe uppers, and upholstery from skins of codfish, catfish, salmon and blue-fish.

The new process for curing hides and skins with salt-saturated absorbent paper has been found to require the addition of an antiseptic. The mixing of zinc oxide or peroxide with salt has been proposed as highly effective for curing hides and skins.

Owing to continuous spread of the industry since the World War, the present 1937, world production of leather is about 25% more than in pre-war years. Except for the depression years, international trade has been well maintained because of increased consumption.

The leading export countries in 1936 according to dollar value at the exchange rate of Dec. 31, 1936 were: Belgium, \$30,895,583; Germany, \$23,548,850; the United Kingdom, \$18,024,610; United States, \$16,394,000; France, \$6,136,427.

**Lebanon:** see SYRIA AND LEBANON.

**Leeward Islands,** a loosely federated British West Indian colony, with local autonomy in its several units (Antigua, St. Kitts-Nevis, Dominica, Montserrat, and thirty-two of the Virgin Islands); language, English; capital, St. John (Antigua); governor: Sir Gordon J. Lethem. The area is 680 square miles. Population (official estimate, 1936), 139,694 with about 98% negroes and mulattos. The chief cities are: St. John, 10,000; Roseau (Dominica), 8,000; Basseterre (St. Kitts), 8,000. The Government is administered by a governor and council.

The new constitution for the colony, approved in 1936, went into effect in 1937. On April 6, 1937, it was officially announced that preparations were being made to transfer administration of Dominica from the Leeward Islands to the Windward Islands. Steamer communication, with air service from Antigua, is maintained with the outside.

Imports (£656,985 in 1936) principally foodstuffs and manufactured articles, are chiefly from the British Empire, with Great Britain (42%), Canada (20%), and the United States (16%). Exports (£629,200 in 1936), of which sugar comprises 70%, are over 90% to the British Empire (Great Britain, 52%; Canada, 32%). The principal product is sugar, with some cotton, and tropical fruits. The monetary unit is the pound sterling.

(L. W. BE.)

**Legislation, Congressional:** see CONGRESSIONAL LEGISLATION.

**Legouis, Emile** (1861-1937), D.Litt., French literary critic; born at Honfleur, Oct. 31. He held the professorship of English at the Sorbonne from 1904 till 1932. In Dec. 1932 the past and present professors of English at the British and Irish universities signed and presented to Legouis an address of admiration and gratitude for his outstanding services as interpreter of English literature to the British, hardly less than to the French, public. In 1926 he published an English translation of his *Histoire de la littérature Anglaise*, and in 1934

*A Short History of English Literature*. His last completed work was a translation of *The Winter's Tale* into French blank verse. He died Oct. 16, 1937. A short biographical notice appears in the *Encyclopædia Britannica*, vol. 13, p. 880.

**Lehmann, Ernst August** (1886-1937), German dirigible expert, died at Lakewood, N. J., May 7, 1937, as a result of burns received from the fire which wrecked the dirigible Hindenburg. He had commanded the ship the previous year and was making the first trip of the 1937 season in an advisory capacity to Captain Max Pruss. Born at Ludwigshafen, March 12, 1886, his experience with lighter-than-air craft dated from his graduation from engineering school in 1912. For two years he served as a pilot of commercial craft and after the declaration of war worked to develop the dirigible as a practical instrument of war. He played a prominent part in the air raids on London and received the Iron Cross for his service in directing 1,075 flights. Following the war, he devoted his attention to developing commercial ships. In 1928 he became commander of the Graf Zeppelin, serving until he assumed charge of the Hindenburg in 1936. He was recognized internationally as an authority on lighter-than-air flying.

**Leland Stanford Junior University:** see STANFORD UNIVERSITY.

**Lemieux, Rodolphe** (1866-1937), Canadian statesman; born at Montreal, Nov. 1. He was educated at Nicolet and Laval university, and graduated in law, becoming a K.C. in 1897. He was solicitor-general of Canada 1904-06; postmaster-general 1906-11; minister of marine 1911; speaker of the Canadian house of commons, 1922-30. In 1930 he became a member of the Canadian senate. He died Sept. 28.

**Lemons and Limes.** A good winter crop of lemons was reported for the 1937-38 season in Italy, one of the leading producers, but as an unfavourable demand for Italian lemons retarded the marketing of the summer crop into the autumn it is considered probable that much of the crop will go into the production of lemon oil, citric acid and lemon juice. A plant disease known as "mal secco" has caused some damage to Italian lemons.

California production of lemons in 1936-37 was 8,550,000 boxes, compared to 8,102,000 boxes the previous season and a five-year average of 7,208,000 boxes. In New South Wales the crop was 324,000 boxes, an increase over the six-year average of 301,450 boxes. Exports of lemons from Palestine were 81,000 boxes. Egypt, which prior to 1931 exported practically no citrus fruits has more recently become a producer for the European trade, principally with exports to the United Kingdom and the Netherlands. Egypt is marketing chiefly oranges, mandarins and sweet lemons, although increasing its exports of sour lemons which were about one-fourth those of Palestine.

Production of limes in Florida the past season was 110,000 boxes, as against 45,000 boxes the previous year and a five-year average of 8,000 boxes, the U.S. Department of Agriculture reports. U.S. imports of limes in 1936-37 were reported by the Department of Agriculture as 11,638,000 lbs., valued at \$318,000 and compared to 9,824,000 lbs., valued at \$274,000, the preceding season.

(S. O. R.)

**Leningrad.** The second city in the U.S.S.R.; pop. (1935) 2,739,800. Founded by Peter the Great in 1703 at St. Petersburg, it was the capital of Russia until 1924. It is now the centre of the Leningrad Province (which is divided into two

parts by the Karelian A.S.S.R.), is an important industrial place with over a half-million factory hands, and holds first place in the machine-building industry in the Union. It also has ship-building, metallurgy, chemical, electro-technical, textile, clothing, food, and printing industries. Its importance as a port (especially for timber export) has been enhanced by the newly built canals (White Sea-Baltic canal, 1933, and Moscow-Volga canal, 1937).

Industrial plants apart, its cultural amenities give Leningrad the rank of the second city in the Soviet Union. In 1936, it possessed 65 museums, 56 libraries, 39 theatres, 53 cinemas, 58 higher educational institutions, 40 Rabfaks, 102 technical colleges, and 180 research institutes. (S. YAK.)

**Leopold III** (1901— ), King of the Belgians, succeeded his father, Albert I, on Feb. 17, 1934; married, Nov. 4, 1926, Princess Astrid of Sweden, who died, as the result of a motor accident in Switzerland, Aug. 29, 1935. King Leopold was educated at Eton, where he was a fellow-pupil with the Duke of Gloucester, and served in the field towards the end of the World War. He visited London twice during 1937—privately in March, when he discussed his country's foreign policy with British ministers, and on a State visit in November. During the former visit he was made Colonel-in-Chief of the 5th Royal Inniskilling Dragoon Guards, an honorary Colonelcy which his father had held before him. In February King Leopold was visited in Brussels by the King of Sweden. On July 21 he wrote to his premier, M. Van Zeeland, suggesting that an independent permanent and universal organization of economic studies be formed to assist in the solution of world problems, and at his London visit in November, in a speech made at the Guildhall in reply to an address of welcome, he again manifested his preoccupation with the world's economic difficulties. (See also BELGIUM.)

**Leprosy.** Investigations of the geographical distribution of leprosy and of the degree to which it prevails in peoples of varied social customs, food habits and concepts of it have been extended in 1937, and have included countries and localities in Africa, South America and Oceania. Surveys in Nigeria led to an estimate of the presence of 200,000 cases, or about one per cent of the population. In Colombia the incidence remains entirely unknown.

The Nigerian leaders regard patients with paralyses, contractures and mutilations which are sequelae of more active processes, as those among whom restrictive measures should be practised, and they are relatively uninterested in those stages of the disease in which it is probably more readily communicable. In Colombia an asylum and care afforded the leprosy by governmental institutions are surreptitiously shared by the non-leprosy. These concepts may be contrasted with the mandatory segregation of all recognized cases in Australia and portions of the United States of America.

Juvenile leprosy has been subjected to further study because of its importance in the determination of local sources of infection, the minimal periods which occur between the probable invasion of the body by the virus and the development of the disease in a clinical form, and the evolution of the disease after the initial infection. Re-examinations of children in Ceylon examined two and four years previously contributed further to the observation that the infection of children before the age of puberty may remain latent for years, or may become spontaneously arrested and leave few or no residual effects.

The frequency of occurrence of "leprides" among patients in China, India, Japan and Africa has interested students who are endeavouring to classify these lesions of the skin by clinical and histological criteria, and to determine their genesis and signifi-

cance in the type and course of the disease with especial reference to their relation to the resistance or immunity of the patient, and the effect of environment upon their development. Their resemblance to lesions occurring in the skin of tuberculous individuals, and the apparent absence or scarcity of specific bacteria demonstrable by modern technique may be regarded as their distinguishing characteristics.

These lesions, and other analogies with infections of man and the lower animals by bacteria which resemble that of leprosy in morphology and staining characteristics, have renewed comparative histological and clinical researches into tuberculosis, rat-leprosy, para-leprosy of cattle, lepra bubalorum (buffaloes) and nodular subcutaneous tuberculosis of cattle.

Likewise, comparisons are being made with lupus erythematosus, sarcoid, von Recklinghausen's disease and other conditions in which the cellular or architectural changes of the tissues are analogous to those occurring in leprosy.

Modern bacteriological methods which have been applied in the study of tuberculosis are being tried in both efforts to cultivate the bacterium of leprosy in laboratories, and to determine the identity or causal relation of the numerous strains of bacteria which have been isolated from leprosy materials. Bio-chemical procedures are being applied to the isolation and reactions of the proteins of these various organisms; and the products obtained by these chemical extractions are being introduced into the skin of leprosy patients to learn whether they produce swelling and redness at the site of injection such as that which occurs in tuberculosis patients when tuberculin or other extracts of the tubercle bacillus are injected. Similar extracts are also being investigated for the purpose of making a diagnosis of leprosy in early stages previous to the development of frank clinical evidence, and to determine whether the disease processes have become inactive.

Diagnosis by serological tests made with reagents derived from bacteria resembling that of leprosy has been reported as successful, but this has not yet been adequately confirmed by other investigators.

Additional serological tests and reactions are being developed for diagnostic purposes, and those previously made are receiving further study. The observation that the blood serum of many patients who have leprosy in advanced stages, but who do not have syphilis, will react with positive results in serological tests for syphilis has had further corroboration.

Emphasis is again directed to the education of the people with regard to the communicability of the disease, as a means of preventing its dissemination among them when conditions are favourable to its development. However, segregation of the sick in institutions by governmental mandate is regarded by some as ineffective, and its discontinuance as a preventive measure is the subject of active discussion. The rôle of poor economic status, and the attendant inadequate food and unsanitary social practices are again brought forward as handicaps to preventive and therapeutic efforts.

Specific therapy has received further consideration, but has been characterized for the most part by modifications of methods and drugs previously used. (N. E. W.)

**Lettuce.** Production of lettuce in the U.S. for market in 1937 was 21,375,000 crates from 154,800 acres, compared to 21,355,000 crates from 165,640 ac. in 1936 and a five-year average (1928-32) of 19,163,000 crates. The total cash income for the 1937 crop was \$33,767,000 as against \$30,259,000 in 1936 and a five-year average of \$30,511,000. Yield per acre was 138 crates in 1937 and 129 crates in 1936, with a five-year average of 149 crates. The price paid per unit marketed was in 1937 exactly the same as the five-year average, \$1.59 compared to \$1.45 in 1936.

Production by States in 1937 was as follows, figures in parentheses being for 1936: California, 12,247,000 crates (14,018,000); Arizona, 4,390,000 crates (4,090,000); Washington, 860,000 crates (802,000); New York, 851,000 crates (770,000); Florida, 454,000 crates (407,000); Colorado, 470,000 crates (390,000); New Jersey, 260,000 crates (242,000); North Carolina, 84,000 crates (118,000); South Carolina, 40,000 crates (60,000); Idaho, 15,000 crates (18,000); Oregon, 20,000 crates (30,000); Virginia, 42,000 crates (32,000); New Mexico, 20,000 crates (18,000); Pennsylvania, 46,000 (39,000). (S. O. R.)

**Leviathan:** see SHIPPING, MERCHANT MARINE: *Scrapping Market*.

**Lewis, John Llewellyn** (1880— ), United States labour leader, was born in Lucas, Ia., Feb. 12, 1880. His first important position after local work among fellow miners was as legislative agent for the United Mine Workers in Illinois. He was so successful in this capacity that he was chosen as an American Federation of Labor organizer in 1911. He served ably in this post until 1917 when he returned to the United Mine Workers as vice-president. In 1920 he received the presidency and it was in this post that he finally assumed a dominant place in American life as leader of a movement for industrial unionism which challenges the craft union organization of the long dominant American Federation of Labor. When the Federation expelled the unions and their members affiliated with Lewis' Committee for Industrial Organization in July 1936, a labour dispute was precipitated which continued throughout 1937. During the year Lewis concentrated his effort upon expanding the membership of the Committee for Industrial Organization in order to increase its influence. He claimed to have tripled the enrolment of 1,400,000 during the year and succeeded in reaching agreements with several leading United States corporations which enabled him to expand his activities. Realizing that factional disputes were handicapping the American labour movement, Lewis and President Green of the American Federation of Labor endeavoured in the last months of the year to secure some arrangement which would permit co-operation. The year closed without such an understanding being reached, but there was no doubt that the Committee for Industrial Organization constituted an economic and political force of significant proportions.

**CHARACTERISTIC ATTITUDES** of John L. Lewis, whose Committee for Industrial Organization challenged the craft unions of the American Federation of Labor

**Liberal Party.** At the general election of Nov. 1935 the Liberal Party in England seemed to have reached its nadir as a political force. In a House of Commons of 615 members, only 54 had been returned as Liberals, and of these 33 were followers of the Government, returned with Conservative support. The remaining 21 formed a Liberal opposition under Sir Archibald Sinclair: their former leader, Sir Herbert Samuel, had lost his seat at the election, and was subsequently raised to the peerage at King George VI's coronation. Undismayed by misfortune, both sections of the Party set to work by midsummer, 1936, to consolidate their position. The Liberals of the opposition section overhauled their machinery and established a Liberal Party organization, with an annual assembly (which met for the first time at Buxton in May 1937) and an executive council; area and constituency associations being simultaneously strengthened. The Liberal national council was created as a controlling body of the section which, under Sir John Simon, co-operates with the Conservatives; a central office was opened, and branches were started in a number of constituencies. Relations between the two sections remain strained. Sir John Simon's followers contend that they leave the Government with liberal principles, and that in any case national unity, especially against the spread of Socialism and Communism, continues to be more important than subservience to old Liberal dogmas. The followers of Sir Archibald Sinclair, on the other hand, consider that their former colleagues must ultimately merge into the Conservatives; that the crisis which called for a united front has passed; and that the Government has mishandled foreign affairs and is courting catastrophe by its devotion to tariffs.

By-elections in 1937 showed an appreciable turn-over of votes in favour of opposition Liberal candidates, without any actual gain of seats. In the constituencies, except in London, there was a general revival of activity, in which the women took a prominent part, and towards the end of the year fresh interest was aroused by the rise in prices. This, argued orthodox Liberals, was the inevitable result of the Government's protectionist policy and the sole remedy both for rising costs and for unemployment was the freeing of the channels of world trade. Besides demanding, therefore, better support for the League of Nations, a juster distribution of wealth, and an electoral system which will be fair to all parties, the program of the opposition Liberals lays special stress on the general lowering of tariff walls, as a step toward allaying much of the prevailing international friction and as a potent influence for peace.

(ME.)

**Liberia**, an independent Negro republic on the west coast of Africa, bounded N.W. by Sierra Leone and in the hinterland and E. by French West Africa. Area, c. 44,000 sq.mi.; pop., from 1,500,000 to 2,000,000. The president (since 1931) is the Hon. Edwin Barclay, his term of office expiring in 1943; he is assisted by a cabinet, and there is a parliament of two chambers, both elected. The official language is English, and the national flag horizontal stripes of alternate red (6) and white (5) with, in the upper flagstaff corner, a white star on blue ground.

Liberia's principal products are palm kernels and oil, piassava, coffee, cocoa, ivory, kola nuts, and rubber, for the latter of which the American company, Firestone Plantations, has a concession in return for its development of the capital. There are no railways, and the making of roads fit for motor traffic is in its infancy, and that only in the coastal areas. Shipping entering Liberian ports during 1934 amounted to little over 1,300,000 tons, of which nearly 502,000 tons were British. Exports and imports to the United Kingdom and the United States were, respectively: exports, £7,545 and \$505,339; imports, £86,634 and \$534,639.

In 1927 a loan of \$5,000,000, of which half has been issued, was raised in the United States, but in 1931, largely on account of forced labour, bad sanitation, and backward conditions generally, the United States refused to recognize the new president. Liberia then applied to the League of Nations for financial and administrative assistance, but, after long negotiations, the Government refused the League's proposals which, in May 1934, were formally withdrawn. In June 1935, Liberia's plans for economic and social rehabilitation now being found to be acceptable, the United States granted recognition to President Barclay and his Government.

**Libraries.** It is encouraging to note, from the incomplete statistics available, that appropriations in the United States for tax-supported libraries have been increased in the past two years, that many libraries have been able to restore salaries cut during the depression, and that in a few instances salaries have been increased. The situation of libraries deriving their income wholly or in part from invested funds is less encouraging. Much, however, remains to be done to regain the ground lost from 1930 to 1935. Much must also be done by library authorities and by governing bodies to raise the general level of library salaries to a point where they are equal to those prevailing in professions (e.g. teaching) requiring a comparable standard of education and training. Although increases in book collections are again reported, the depletion of stocks because of reduced funds for purchase and replacement presents a serious problem from which it will take time to recover.

The forced economies of the depression years have led to a fresh examination of the techniques employed with the beneficial result that many routine processes have been simplified. Renewed attention has been given to various co-operative efforts. The co-operative cataloguing project, conducted at the Library of Congress since 1933 with a grant in aid from the General Education board, is continuing its important service for scholarly libraries. A board on Resources of American Libraries was established by the American Library Association in 1936 to "further and guide efforts toward the effective increase, co-ordination, geographical distribution, and use of the materials for research and education in American libraries." The development of union catalogues, surveys of book resources, and microphotographic copying of research materials, are among the subjects under consideration. Recent efforts to improve and strengthen college, junior college, and school libraries, are an indication of the significant place occupied by the library in modern education. The use of microphotography as a cheap and convenient method of reproducing ma-

THE LIBERIAN ARMY of 400 parades past the president's house in celebration of the ninetieth anniversary of the republic's independence

terials for research is being actively studied. Librarians are encouraging experimentation, investigating cameras and reading appliances, and testing the use of microfilms by readers. The close of 1936 saw the publication of the final part of Sabin's *Dictionary of books relating to America* (29 vols., 1868-1936). This great bibliography was begun by Joseph Sabin (parts 1-82, 1867-81), continued by Wilberforce Eames (parts 83-116, 1884-92), and completed by R. W. G. Vail for the Bibliographical Society of America (parts 117-172, 1927-36).

**Federal and State Aid.**—An event of great potential significance for library development was the establishment of a library service division in the U.S. Office of Education of which Ralph M. Dunbar has been appointed (Nov. 26, 1937) chief. Specialists in public and in school libraries have also been appointed. In 1936-37 the Library Extension board (American Library Association), supported by planning committees of State associations, conducted vigorous campaigns in various States for State aid for library development, particularly in rural areas. Appropriations were secured in four States: Arkansas, \$64,000; Ohio, \$150,000; Vermont, \$25,000—these three for the biennium; and Michigan, annual appropriation of \$500,000 beginning with 1938-39. Increased appropriations for State library extension agencies are generally reported.

**Library Training and Staff.**—On Jan. 5, 1937, the fiftieth anniversary of the establishment of the first training school for librarians was commemorated. In 1887 Melvil Dewey, then librarian of Columbia college, opened a School of Library Economy. Removed to Albany in 1889 as the New York State Library school when Dewey became director of the State library, the school remained there until 1926 when it was transferred to Columbia university and merged with the Library School of the New York Public Library (est. 1911) to form the present School of Library Service. The 1936-37 report of the board of education for librarianship (American Library Association) lists 26 schools of various types accredited by the board as meeting its standards; all are connected with teaching institutions. On Nov. 1, 1936, the total enrolment was 1,345, and the number of graduates for the year 1936-37, 900. A total of 18,911 persons have been graduated since 1887 from all library training schools, including those no longer in existence. In addition to scholarship funds provided by individual schools, the Carnegie Corporation continued its aid

by appropriating, 1937-38, \$10,900 for the United States and Canada. Laws providing for the certification of librarians as to education and training were passed in Georgia, Tennessee, and Virginia in 1936-37. Seven States now legally certificate librarians in municipal, county, and regional libraries. School librarians in 23 States and the District of Columbia are certificated chiefly through rulings of State departments of education.

In June 1937, the staffs of the New York Public Library, and of the Brooklyn and Queensborough public libraries were admitted to the New York State employees retirement system (effective July 1, 1937), the city agreeing to provide the funds for city-paid employees, and the trustees of the New York Public Library undertaking to make the necessary contributions for the employees of the Reference department. This is the successful culmination of years of effort to secure pensions.

**Flood Damage.**—Many libraries in the Ohio valley were damaged by the severe floods of 1937. Kentucky, estimated damage of \$300,000, and Indiana of \$64,000, were the States most seriously affected. The Louisville (Ky.) Public Library placed the damage to buildings, books, and equipment, at \$200,000.

**Library Buildings.**—The Rundel Memorial building of the Rochester (N.Y.) Public Library was opened Oct. 5, 1936. It is similar in plan to the Enoch Pratt Library, Baltimore, Md. The cost was approximately \$1,300,000, of which \$1,000,000 came from the bequest of Morton W. Rundel. The Library of Congress annex, for which roughly \$8,225,000 have been appropriated, is rapidly nearing completion and should be ready for occupancy the latter part of 1938. Although mainly for book storage, estimated capacity 10,000,000 volumes, the annex will also provide much-needed work and study space. The City of New York, late in 1937, authorized funds of \$2,000,000 for the construction of the new Brooklyn Central Library, utilizing the present foundations of the uncompleted wing that was begun over 20 years ago. The new quarters for the general library of the University of Pittsburgh were opened in May 1936, on the fourth, fifth, and sixth floors of the "cathedral of learning." A new library, cost \$230,000, was opened at the Agnes Scott college, Decatur, Ga., in the fall of 1936. In Oct. 1937, new buildings were dedicated at the University of Oregon, Eugene, at Denison university, Granville, O., at Brooklyn (N.Y.) college, and at the Rhode Island State college, Kingston.

The following libraries contain more than 1,000,000 volumes each, according to the latest available statistics: the Library of Congress, 5,395,044 vols. (June 30, 1937); the New York Public Library, 3,871,258 vols. (comprising reference department, 2,551,426 vols. and circulation department, 1,319,832 vols.) (Dec. 31, 1937); Harvard university, 3,861,438 vols. (July 1, 1937); Yale university, approximately 2,650,000 vols. (Aug. 1, 1937); Cleveland (Ohio) Public Library, 2,082,080 vols. (1936); Boston (Mass.) Public Library, 1,693,335 vols. (1936); Los Angeles (Calif.), 1,534,524 vols. (June 30, 1937); Chicago (Ill.) Public Library, 1,612,121 vols. (Dec. 31, 1936); Columbia university (New York city), approximately 1,520,000 vols. (1937); University of Chicago, approximately 1,180,000 vols. (1937); Cincinnati (Ohio) Public Library, 1,161,669 vols. (1936); Brooklyn (N.Y.) Public Library, 1,108,168 vols. (1936); University of Illinois, 1,086,212 vols. (June 30, 1937); University of California, approximately 1,000,000 vols. (1936). Such figures are very uncertain standards of comparison, because of differences in methods of counting, and because public libraries with many branches contain many copies of new and standard books.

**Librarians.**—Keyes D. Metcalf was appointed director of the Harvard University Library Sept. 1, 1937. He was succeeded as chief of the reference department of the New York Public Li-

brary by Paul North Rice, since Feb. 1, 1936, director of libraries, New York university. W. N. C. Carlton has retired from the librarianship of Williams college, Williamstown, Mass., and has been succeeded by Peyton Hurt. Carl Vitz, librarian of the Toledo (Ohio) Public Library, became librarian of the Minneapolis (Minn.) Public Library upon the retirement of Miss Gratia A. Countryman.

The deaths of the following librarians occurred during the year: Herman H. B. Meyer, Jan. 16; George H. Locke, Jan. 28; Wilberforce Eames, Dec. 6; Harry Lyman Koopman, Dec. 28.

**BIBLIOGRAPHY.**—For further information about American libraries consult: *Bulletin of the American Library Association*; *Library Journal*, New York; *Library Quarterly*, Chicago. Important contributions to library literature were: W. M. Randall and F. L. D. Goodrich, *Principles of College Library Administration* (Chicago, 1936); M. L. Raney, ed., *Microphotography for Libraries* (Chicago, 1936), and *Microphotography for Libraries, 1937* (Chicago, 1937); Elva Smith, *The History of Children's Literature* (Chicago, 1937); L. R. Wilson, comp., *Library Trends* (Chicago, 1937). (C. F. McC.)

**Great Britain and Europe.**—Epoch-making developments have been, and still are, going on in British libraries, in the form of new buildings, large extensions, and modernization of equipment. At the British Museum, reconstructive work has already resulted in what is practically a new North Library, now available to those consulting mss., incunabula, and similar precious material. Hard by, the great tower of the University of London is all but finished, occupied chiefly by a colossal book-stack and three magnificent reading-halls. Half the stock of more than 300,000 books has now been transferred there from South Kensington. Reconstruction at the Bodleian has given readers a renovated Arts End. Similar progress is going on at Cambridge. The new Brotherton Library at Leeds, the new Arts Library at Manchester, and the building going up at Liverpool, are great acquisitions for what may be termed the provincial universities. The stately building for the National Library of Wales was opened in July, and the plans have been approved for the National Library of Scotland. On the Continent, the League of Nations Library is the nearest parallel, though extensive alterations are contemplated or in progress in a number of places.

The most recently available particulars regarding some of the leading British and European libraries are as follows: British Museum, 4,450,000 books, 200,000 mss. Patent Office, 282,000 vols. Admiralty, 100,000. War Office, 130,000. Board of Education, 80,000. House of Commons, 80,000. House of Lords, 55,000. Foreign Office, 75,000. Board of Trade, 56,000. India Office, 200,000, and 20,000 mss. National Art Library, 200,000 and 250,000 photos, etc. Natural History Museum, 200,000. Science Museum, 250,000, including 113,000 periodicals. London university, 310,000, including the Goldsmiths' library of economic literature, 60,000. Note also the libraries of University college, 365,000, King's, 86,000, London School of Economics, 750,000, and the Institute of Historical Research, 48,000. The law libraries of the Inns of Court, 60,000; Lincoln's Inn, 70,000; Inner Temple, 85,000; Middle Temple, 70,000. The Royal Society, 120,000. Athenaeum, 80,000. National Liberal Club, 35,000, and 40,000 pamphlets. Royal Institution, 65,000. The London Library, 450,000, is the foremost subscription library. Among the most important public libraries is the Guildhall, 122,000, and 20,500 mss. Among the special libraries may be mentioned those of the Royal Society of Medicine, 150,000; Royal College of Surgeons, 80,000; Society of Antiquaries, 100,000; Warburg Institute, 85,000, and 45,000 photos; Royal Asiatic Society, 45,000, and 1,500 mss.; Linnean Society, 55,000; Geological Society, 55,000; Zoological Society, 35,000; Chemical Society, 40,000; Royal Empire Society, 250,000. (See R. A. Rye, *Libraries of London 1910*; *Minerva*, 1937; *Libraries, Museums, and Art Galleries*, 1937.)

THE REFERENCE LIBRARY at the British Museum, which draws students from all parts of the world

At Oxford, the Bodleian Library has over 1,500,000 books and 40,000 mss., and the Tylor Library 120,000 vols. The chief libraries at Cambridge are the University Library, with about 1,500,000 books, 10,000 mss., and 200,000 maps, and Trinity College, with 120,000 books and 1,600 mss. The Mitchell Library, Glasgow, has 200,000 vols. The John Rylands Library, Manchester, contains the Althorp collection of early printed books (115,000).

The National Central Library co-ordinates the services in England and Wales, with a Scottish and an Irish Central Library for those regions. It makes accessible to readers in any place some 21 million books, and also has an international service.

The *Bibliothèque Nationale*, Paris, has 4,000,000 printed books, 500,000 mss., and 20,000 periodicals. Other French libraries include the *Bibliothèque de l'Arsenal*, 1,000,000, and 12,500 mss.; *Bibliothèque Mazarine*, 350,000, and 48,000 mss.; *Bibliothèque Ste.-Geneviève*, 700,000, and 4,000 mss., and 20,000 prints; the library of the *Senate*, 250,000, and 1,300 mss.; the *University*, 1,000,000 with 1,590 mss. and 130,000 theses; *l'École normale supérieure*, 450,000; *Musée d'Histoire naturelle*, 350,000, with 1,130 mss., and 30,000 other items; *l'Institut*, 700,000; *Bibliothèque historique de la Ville de Paris*, 300,000, with 2,000 mss.

and 19,000 maps. The wealth of the French provincial libraries, and of the capital and provincial libraries of Germany, Italy, Belgium, and the majority of the other European countries, may be judged when it is said that the number of such libraries comparable to, or even richer than, many of those already mentioned is too great to be included in this brief survey. (E. A. BA.)

**Library Association.** The Library Association, founded 1877 as the Library Association of the United Kingdom, incorporated by royal charter 1898, is the representative body for libraries and librarians throughout the British Commonwealth of Nations. Its objects are, to unite all interested by holding conferences for the discussion of bibliographical and kindred questions, to promote the better administration of libraries, to promote the status and qualifications of librarians, to watch and contribute to library legislation, and to hold examinations in librarianship. Its headquarters are at Chaucer House, London, and it has a number of branches, such as the Northern Ireland and the Scottish Library Associations, and special sections such as that dealing with university and research libraries. Total membership, 5,350. Its professional regis-

ter comprises 845 fellows and 734 associates. About one-fourth of the members hold university qualifications, these being chiefly from the State, university, and other learned libraries. The annual conference is held during a week in June, at various centres, and meetings for papers and discussion take place in the winter months. Professional examinations have been held annually since 1896, and certificates awarded. The association runs correspondence classes and organizes summer schools. It was instrumental in the establishment of the University of London School of Librarianship in 1919. *The Library Association Record* is the official organ, that for 1937 is the 39th volume. Among many invaluable textbooks and tools, it publishes *The Subject Index to Periodicals* annually, and *Reference Books*, a classified guide, with supplements. There is an information bureau at Chaucer House. See also *The Library Association Year-Book*, 1929 continued. For The Library Association of the United States, see AMERICAN LIBRARY ASSOCIATION. (E. A. BA.)

**Libya,** a large but mainly desert Italian colony in N. Africa, bounded N. by the Mediterranean, W. by Tunis and Algeria, S. by the French and the Anglo-Egyptian Sudan, and E. by Egypt. Divided into the four provinces of Tripoli, Misurata, Bengazi, and Derna, with a military territory in the south, the estimated area is about 400,000 sq.mi. (excluding a partially surveyed hinterland of over 200,000 sq.mi.), with a population (1931) of 728,000, of whom about 45,000 were Italians.

The governor, Marshal Balbo, succeeded Marshal Badoglio in 1933; his functions are administrative only, the legislative power being reserved to Rome and the Italian courts having final jurisdiction. Italian and Arabic are the official languages; Arabic is generally spoken, and the natives are mainly Mohammedan. The chief towns (others being mere caravan centres) are the ports of Tripoli (pop. 95,000), in the W., Homs (31,000), Misurata (43,000), and Bengazi (44,000); the latter port is in course of reconstruction at a cost of 12,000,000 lire.

**History.**—A decree of Jan. 1937 ordering Jewish shop-keepers to open their shops on Saturdays and close them on Sundays was

widely resisted and led to much persecution of the Jews; in March Mussolini paid an official visit to the country, where he opened the 1,200mi. coast road connecting the Egyptian and Tunisian frontiers, reviewed the Italian navy, which was concentrated at Tripoli, and proclaimed himself "Protector of Islam." On April 10, from Rome, Mussolini announced a new constitution under which Libya was to be an independent military and naval unit of Italy's African empire, Libyan agriculture was to be subsidized, 24,000,000 lire were to be spent on housing in the African colonies generally, and the Muslim community was to have further privileges. In September and October the garrison was reinforced by over 1,200 men.

**Trade and Communications.**—Agriculture and stock-raising (sheep, goats, cattle, camels) are the chief industries, and on the coast sponge and tunny fishing are prosperous. Cereals, with the olive, vine, mulberry, and other fruits are grown in the steppe country, the oases produce dates, oranges, etc., in plenty, and tobacco growing and manufacture is now a flourishing industry. Imports in 1935 were valued at 398,154,000 lire, and exports at 61,161,000. The budget estimates for 1935-36 were: revenue (including State contribution 291,800,000 lire), 420,704,000 lire; expenditure balanced at that figure. The official currency is the Italian, but English and French money is also in use.

Libya has about 270mi. of railway, an extensive system of caravan tracks, and, including the new coast road, about 4,000mi. of road fit for motoring. Telephone communication is good; and there is a daily air-service between Tripoli and Rome.

**Liechtenstein,** independent State, Europe, N.E. of Switzerland (customs and postal alliance). Capital, Vaduz. Ruler, Prince Francis I (born 1853; succeeded 1929); administrator, Dr. Joseph Hoop (1928); Diet (15). Area, 65 sq.mi.; population, 10,213 (nine-tenths Catholic), mainly agricultural (cattle). Products: corn, wine, fruit, wood, marble. Currency, Swiss franc. (H. Fw.)

**Lie Detector.** Throughout the centuries many methods have been employed in an effort to detect deception or innocence and guilt. Since 1900 Lombroso, Benussi, Burt, Marston, Larson, Keeler and others have experimented with psycho-physiological techniques for detecting deception; recently 12 law-enforcement agencies have acquired instruments to be

POLYGRAM OF SUSPECT lying regarding stolen merchandise. Note following responses to question No. 4: 1. Shift in respiratory base line followed by increase in amplitude at irrelevant question (No. 5). 2. Drop in electro-dermal curve indicating decrease in skin resistance and other electro-dermal responses. 3. Rise in blood pressure curve followed by fall after irrelevant question (No. 5).

SUBJECT UNDERGOING DECEPTION TEST on lie detector. 1. Blood-pressure cuff. 2. Pneumograph contact. 3. Electro-dermal electrodes. 4. Pneumo-cardiograph unit, which records breathing, pulse and blood pressure. 5. Galvanometer unit, which indicates if the test is, literally, making the subject sweat

used as "lie-detectors." Staff members of the Scientific Crime Detection Laboratory of Northwestern university have used these techniques to examine approximately 5,000 individuals regarding criminal acts, and dishonesty in financial and business institutions. A number of corporations have adopted the same procedure in the examination of applicants seeking positions, and recently two municipalities have incorporated it in their police applicant examination routine.

Deception tests are, in general, based on the theory that bodily changes accompany emotion; thus through the continuous and simultaneous recording of certain voluntary and involuntary bodily functions graduated variations in emotional tone can be obtained, and responses to one stimulus may be compared with responses to another. In the technique now most generally employed a number of recording units are combined into a single apparatus. A cardio-sphygmograph records the pulse rhythm and variations in blood pressure, the galvanograph records electro-dermal responses (which closely follow sweat gland activity) and the pneumograph records respiratory movements. The whole is commonly referred to as a Polygraph.

The entire test procedure is carefully controlled so that fear of

the innocent and environmental factors will not interfere with the obtaining of specific responses to relevant questions which are indicative of deception. After control Polygrams of a given individual have been obtained, the subsequent test procedure depends upon the nature of the problem at hand and upon the experiences that the individual being examined has undergone during the investigation preceding the deception tests. (See also CRIME; FEDERAL BUREAU OF INVESTIGATION; RACKETEERING.)

(L. KE.)

**Life Insurance.** During the year 1937 life insurance companies of the United States and Canada continued their progress towards recovery from the effects of the depression. The estimated new business for the year of \$16,000,000,000 is still short of the \$21,000,000,000 for each of the years 1929 and 1930. The total amount of life insurance in force at the end of the year was expected to reach \$115,000,000,000 or more than \$2,000,000,000 in excess of the highest on record during 1930. Since 1930, assets have increased from approximately \$20,000,000,000 to \$28,000,000,000. The premium income of \$3,850,000,000 for 1937 will be greater by more than \$100,000,000 than during 1930. The income from all sources during 1937 will amount to \$5,700,000,000. These are necessarily estimates. The mortality experience of the year was favourable.

The problem of the investment of funds continued to present a serious difficulty. As a result of the limited avenue of investment in other fields, the funds of life insurance companies invested in U.S. government bonds have increased greatly—more than tenfold during the past five years. The rate of interest obtainable continued low during the year. The recession in the security market occurring during the last weeks of the year, affecting non-amortizable securities, is expected to decrease the amount of contingency reserves and surpluses of many companies.

A corollary to the difficulty of obtaining good returns on investments was the large sums of money received by life insurance companies for annuities and single premium policies. In 1930 the amount received for annuities by life insurance companies in the United States and Canada was about \$100,000,000 as compared with over \$450,000,000 in 1936. The amount is likely to be somewhat less for 1937.

The low interest rates obtainable on investments during the past few years have been accompanied by an increase in the amount of insurance moneys left with the company under settlement agreements after the death of the insured or on maturity of the policy. During the past six years, the amount of these proceeds of policies has increased from approximately \$300,000,000 to about \$1,000,000,000, excluding supplementary contracts involving life annuities. During 1937, most of the leading companies placed restrictions on the granting of complicated settlement agreements and also on agreements which might extend for too long a time into the future.

The decision of the U.S. Supreme Court declaring the Social Security Act constitutional has called attention to the need of providing pensions in old age for those who are not covered by that Act while those who are covered may realize the need of supplementing future Government payments through insurance companies. In Canada, the decision of the Supreme Court declaring the social legislation under dominion auspices unconstitutional was upheld by the British Privy Council on appeal.

A legal case of importance was decided by the New York Court of Appeals, the highest tribunal in the State, in which the court approved the practice of an insurance company taking into account its disability experience in apportioning dividends under life insurance policies with disability benefits. An important action was taken by industrial life insurance companies in liberalizing their policies, the chief change being the granting of non-forfeiture values for policies which lapsed after the payment of premiums for six months instead of three years as heretofore.

**Great Britain and Ireland.**—With regard to Great Britain, the year proved to be a satisfactory one. Life insurance companies will probably have placed on the books about £428,000,000 as compared with £408,000,000 in 1936. The insurance in force at the end of the year for British companies is estimated to exceed £3,400,000,000. At the beginning of 1937, the total assets of all of the life insurance companies domiciled in the United Kingdom amounted to almost £1,250,000,000. The premium income during the year 1936 (the last year for which such figures are available) amounted to over £150,000,000, while the total income for that year, including investment income, equalled £205,000,000. The year witnessed an increase in group life insurance and annuity plans, in spite of increases in annuity rates during recent years. The average rate of interest has been decreasing in recent years, but is in excess of that earned by American companies in the last year or two. The mortality rate in England also continues to be favourable.

A policy holder in Great Britain is entitled to an income tax rebate on premiums on a policy providing insurance on his own life or that of his wife up to a maximum limit of one-sixth of his income. This concession encourages the insuring public to pur-

chase high premium policies. It may be noted that 75% of the new business is under endowment insurances against approximately one-half of that proportion in the U. S. and Canada.

A significant event of the past year is the withdrawal from the Irish Free State of several British companies with respect to their life business. This is principally due to a law compelling companies doing a combined life, fire and casualty business to confine themselves either to life insurance only or to other lines of coverage. (See also INSURANCE, ACCIDENT AND AUTOMOBILE.)

(A. Hu.)

**Lime.** The popular conception of lime is primarily as a building material, but this is not the case; of the approximately 4,000,000 short tons normally produced in the United States, only about one-quarter is now used in the building industry, and even in pre-depression days, when building was much more extensive, the proportion was well under one-half. Agriculture uses 8 to 10%, and the remainder is divided roughly in the proportion of one-half to chemical, one-quarter each to metallurgical and refractory uses. Of the total sales, about one-third is as hydrated lime and two-thirds quicklime. In Canada production dropped from 674,100 short tons in 1929 to 320,700 tons in 1932, increasing to 405,400 tons in 1935 and 473,300 tons in 1936. Production of lime in Great Britain reached 1,428,000 tons valued at £1,272,000 in 1935 according to the quinquennial census of production by the board of trade. Of this output, but 88,000 tons valued at £160,000 was hydrated.

(G. A. Ro.)

**Limes:** see LEMONS AND LIMES.

**Linen and Flax.** A study of the linen industry during 1937 reveals a sharp transition from the almost boomlike conditions of the first six months to the poor trade which characterized most of the second half of the year. This setback was occasioned by the growing gap between flax and cotton values, the virtual loss of the China market, and disappointing American buying.

The most interesting mechanical development of the year was the introduction of the Eves highspeed drawing frame, whose productive possibilities are remarkable, in that a single-headed first drawing frame will produce 29 miles of sliver per day from a single delivery. The (British) Linen Industry Research Association made further headway in producing new strains of pedigree seed and in developing machinery to decorticate green straw. Continental inventors designed improved flax-production equipment. The latest Soenen flax-pulling machine, which weighs only five cwt., will pull seven acres in one day, attended only by a driver and two youths. There was a considerable extension of the use of hydrogen peroxide in yarn bleaching, and the problems of cheese bleaching were the subject of much investigation.

Linen manufacture does not lend itself easily to mass production, but today strenuous efforts are being made to speed up machinery and cut out unnecessary processes. Cheese winding, for example, has been substituted for reeling and bundling in the case of fine warps. The automatic linen loom is still in the experimental stage; flax is much less tractable than cotton fibre, and, owing to their lack of elasticity, linen yarns need special consideration during manufacturing processes, though their strength should prove a valuable asset for maintenance of continuous production with automatic machinery.

**World Production and Trade.**—The U.S.S.R. remains the world's principal producer and exporter of flax, controlling approximately 80% of the world's (fibre) flax area, and in 1936 produced 5,300,000 centners of flax against 3,300,000 centners in 1913. Acreage was again increased in 1937, but the declared pol-

icy is to reduce fibre exports gradually, in order to cater for the Soviet linen industry, which is growing apace. Germany and Latvia also increased their acreage in 1937, the former to 150,000, while the Belgian and Irish acreage declined to 70,710 and 24,100 acres respectively. The British Empire flax resources now yield barely 5% of the raw material required for linen manufacture, and imports into the United Kingdom have risen from 41,000 tons in 1930 to 66,000 in 1936, drawn mainly from the U.S.S.R., Belgium, and the Baltic States.

Soviet Russia, Germany, and Latvia also increased their consumption of fibre (flax) in 1937, the U.S.S.R.'s 1937 plan calling for 300,000,000 metres of linen fabrics as compared with 285,500,000 in 1936. The United Kingdom, which is still by far the world's largest flax importer and linen exporter, exported linen goods to the value of £7,145,481 in 1936 as against similar exports worth £10,018,626 in 1926. Exports in the first 11 months of 1937 totalled £7,188,017, as against £6,491,106 in the corresponding period of the preceding year. Approximately 45% of the entire United Kingdom linen output is said to cover home demand, but probably half of this goes to shipping houses and finds its way to every corner of the globe.

The United States is the leading market for linens, and 90% of its imports of fine linen weighing less than 4 ozs. per square yard comes from the United Kingdom, from which the imports of linen piece goods, damask, and handkerchiefs for the first 11 months of 1937 amounted to £1,949,768. There were also considerable quantities of linen yarn for threadmaking. Normally China is the leading exporter to the U.S. of embroidery linens, this being an interesting example of a triangular industry in which Northern Ireland provides the piece goods, China the workmanship, and the United States the finished article and a ready market.

Leading linen-exporting countries (in order of importance): United Kingdom, Belgium, Czechoslovakia, U.S.S.R., France.

Leading linen-importing countries (in order of importance): U.S., Australia, Canada, Central and South America, South Africa, China. (C. R. C.)

## Linlithgow, Victor Alexander John Hope,

2ND MARQUESS OF (1887— ), K.T., G.M.S.I., G.M.I.E., viceroy of India, was educated at Eton. He succeeded to the marquessate in 1908, from 1922 to 1924 he was civil lord of the admiralty, and was chairman of the Royal Commission on Indian Agriculture, 1926-28, and of the Joint Select Committee on Indian Constitutional Reform in 1933, succeeding Lord Willingdon as viceroy in April 1936. In Jan. 1937, he made a tour in Burma of some duration. Later in the year, he delivered an important message to British India, dealing with the intentions of the Home Government on constitutional matters. The native press called for a meeting between Lord Linlithgow and Gandhi, whom the viceroy, by a gesture interpreted as one of goodwill towards the Congress Party, invited to visit him at Delhi. The meeting took place in August (see GANDHI).

Lippe-Biesterfeld, Prince of: see JULIANA.

Liquor: see SPIRITS.

**Liquor Laws** and liquor control in the United States since repeal of national Prohibition are still in an experimental stage. A summary of legislation in 1934 shows that the licence plan was used in 17 States and the District of Columbia and the authority plan in 12 States is typical of 1937. Both plans have been extended and one or the other or some combination of the two covers all the States.

Reports at the National Conference of State Liquor Administrators, Mackinac Island, Mich., in July, showed increasing desire for interstate and intergovernmental co-operation, and larger use of State stores combined with licences, a tendency toward State monopoly, at least in wholesale distribution.

In 1937 Alabama became the 43rd wet State, voting approval of legal liquor, and legislation elsewhere that year took the last five States out of the "bone-dry" class. Georgia and Oklahoma have no control authority, but legalize sale of beer and light wines, as do Kansas and Mississippi.

Local option was extended and in 1937 elections dry areas were increased in 15 and decreased in 8 States. Under the North Carolina 1937 act to unify liquor control under a State A.B.C. (Alcohol Beverage Control), 27 counties voted for county A.B.C.'s and 11 against liquor.

Liquor taxation, still a dominant issue in liquor policy, largely determines the extent and effectiveness of control. Where greed for revenue outweighs reform of liquor traffic, bootlegging (*q.v.*) defeats both. Liquor tax laws, 93 in number, were enacted in 18 States in 1937, and mostly imposed new taxes or increased rates. Retaliatory taxes between the States and discriminatory legislation are growing and constitute an ill-omen that may require the exercise of Federal powers under the 21st Amendment to protect dry territory and prevent misuse by the States of their new powers to restrict interstate commerce in liquor. Revenues from liquor taxes usually go into the general fund, but in some States are applied to support of specific public welfare measures. Temperance instruction in schools is required in 20 States.

Federal agencies are essential to make State legislation and State systems of liquor control effective. They have been greatly strengthened by the recent reorganization of the Federal Alcohol Administration, formerly under the Treasury, but now an independent establishment co-operating with the Alcohol Unit of the Bureau of Internal Revenue of the Treasury Department. The original F.A.A. Act to protect revenue derived from distilled spirits, wine, and malt beverages, to regulate interstate and foreign commerce, . . . to enforce the 21st Amendment, etc., was approved Aug. 29, 1935. The Amendatory Act was approved June 26, 1936, but took effect as to the reorganization plan May 15, 1937. Basic permits are required for all interstate and foreign commerce in liquors.

Resale is restricted and permits conditioned on compliance with regulations concerning unfair competition and unlawful practices, and with the requirements of the 21st Amendment and all Federal laws. (S. McC. L.)

**Literacy:** see ILLITERACY.

**Literary Prizes.** So enamoured has the present-day world become of prizes and contests that it would take a small volume to list all the literary awards of a single year. England, France, and the United States lead in prize-giving. Following are some of the more important awards made in 1937.

**International.**—NOBEL PRIZE FOR LITERATURE (*c.* \$40,000): Roger Martin du Gard, French novelist. (See also NOBEL PRIZES.)

**United States.**—ACADEMY OF AMERICAN POETS (\$5,000): Edwin Markham. AMERICAN HISTORICAL ASSOCIATION. GEORGE LOUIS BEER PRIZE (\$240): Charles Wesley Porter, *The Career of Theophile DeClassé*. JEAN JULES JUSSEAND MEDAL: Samuel E. Morison, *Tercentennial History of Harvard*. JUSTIN WINSOR PRIZE: Carl Bridenbaugh, *Cities in the Wilderness*. COMMONWEALTH CLUB OF CALIFORNIA awards to California authors. Gold medals: John Steinbeck, *In Dubious Battle* and Herbert E. Bolton, *Rim of Christendom*. Silver medals: Hartley B. Alexander,

*God and Man's Destiny*, Julia C. Altrocchi, *Snow-covered Wagons*, and George Ripley Stewart, *Ordeal by Hunger*. JULIA ELLSWORTH FORD CONTEST for *Children's Literature*. First prize (\$2,000): Benson Wheeler and Claire Lee Purdy, *My Brother was Mozart*. Second prize (\$1,000): James Hull, *Stage-struck Seal*. GUGGENHEIM FELLOWSHIPS: Dorothy Bethurum, Louise Bogan, Sterling A. Brown, Harold L. Cook, Donald Culross Peattie, Frederic Prokosch, Sonia Raiziss, Jesse Hilton Stuart. HARPER PRIZE NOVEL: Frederic Prokosch, *Seven Who Fled*. HOUGHTON MIFFLIN LITERARY FELLOWSHIPS (\$1,000 in addition to royalties and advances): Dorothy Baker and David Cornel De Jong. LITTLE, BROWN & CO. CENTENARY PRIZE: Odell Shepard, *Pedlar's Progress*. LITTLE, BROWN & CO. NOVELETTE PRIZE (\$2,500): Wallace Stegner, *Remembering Laughter*. MEGRUE PRIZE (\$500, Dramatists' Guild, New York): Arthur Kober, *Having Wonderful Time*. NATIONAL BOOK AWARDS FOR 1936 (American Booksellers Association): Margaret Mitchell, *Gone with the Wind*; Victor G. Heiser, *An American Doctor's Odyssey*; Van Wyck Brooks, *The Flowering of New England*; Della T. Lutes, *The Country Kitchen*; Norah Lofts, *I met a Gypsy*. NATIONAL INSTITUTE OF ARTS AND LETTERS. Gold medal: Charles McLean Andrews. NEW ENGLAND POETRY SOCIETY PRIZE: John Hall Wheelock, *Poems, 1911-36*. JOHN NEWBERY MEDAL (most distinguished children's book): Ruth Sawyer, *Roller Skates*. O. HENRY MEMORIAL AWARDS (best short stories): first prize (\$300), Stephen Vincent Benet, *The Devil and Daniel Webster*; second prize (\$200), Elick Moll, *To Those who Wait*; third prize (\$100), Robert M. Coates, *The Fury*. POETRY (magazine) PRIZES: W. H. Auden, Louise Bogan, Thomas H. Ferril, Franklin Folsom, William Pillin, Roger Roughton, Stephen Stepanchev. PULITZER PRIZES (\$1,000 in each class): novel, Margaret Mitchell, *Gone with the Wind*; play, Moss Hart and George S. Kaufman, *You Can't Take it with You*; history, Van Wyck Brooks, *The Flowering of New England*; biography, Allan Nevins, *Hamilton Fish*; poetry, Robert Frost, *A Further Range*. THEODORE ROOSEVELT MEMORIAL AWARD (\$2,500, Doubleday, Doran): Dean Alfange, *The Supreme Court and the National Will*. EDWIN WOLF NOVEL PRIZE (\$2,500, Jewish Publication Society of America): Beatrice Bisno, *Tomorrow's Bread*.

**Great Britain.**—JAMES TAIT BLACK MEMORIAL PRIZES (about £250 in each class): biography, Edward Sackville-West, *A Flame in Sunlight*; novel (posthumous award), Winifred Holtby, *South Riding*. CARNEGIE MEDAL (children's literature): Arthur Ransome, *Pigeon Post*. GREGORY MEDAL (Irish Academy of Letters): William Butler Yeats. HARMSWORTH (£100): Margaret O'Leary, *The House I Made*. HAWTHORNDEN PRIZE (£100): Ruth Pitter, *A Trophy of Arms*. HEINEMANN (£40): Elvire Pélissier, *Jeux de Vilains*. KING'S GOLD MEDAL (poetry): Wystan Hugh Auden. SCHOOLMASTERS' (£1,000, Hodder & Stoughton): Norah K. Smith, *A Stranger and a Sojourner*. SUNDAY TIMES GOLD MEDALS: George M. Trevelyan, *Grey of Fallodon*; Robert Byron, *Road to Oxiana*; Robert Lynd, *I Tremble to Think*; Margaret Irwin, *The Stranger Prince*.

**Canadian.**—LORNE PIERCE MEDAL (Royal Society of Canada): Stephen Leacock. (See also CANADIAN LITERATURE.)

**French.**—FÉMINA PRIZE NOVEL (5,000 fr.): Raymonde Vincent, *Campagne*. FÉMINA AMÉRICAIN: Naomi L. Babson, *The Yankee Bodleys*. FÉMINA ANGLAISE (£40): Margaret Lane, *Faith, Hope, No Charity*. GONCOURT PRIZE NOVEL (5,000 fr.): Charles Plisnier, *Marriages*, and *Faux Passeports*. INTERALLIÉ: Romain Roussel, *La Vallée sans Printemps*.

**BIBLIOGRAPHY.**—For historical information, see: Bessie Graham, *Famous Literary Prizes and Their Winners*, New York, 1935. Charlotte E. Murray, *Famous Literary Prizes*, New York, 1934.

(M. A. WR.)

**Literary Research.** The most important discovery of 1937 was that of 18 lines of an ode by Sappho, found by Signora Norscia inscribed on a piece of pottery of the second century B.C., which was disclosed by Signor Breccia, an Italian excavator in Egypt. It constitutes the earliest document extant by Sappho, and apparently was written while she was in Crete.

Elderkin published in *Hesperia* two maledictory inscriptions of the third century A.D., found by the American excavators of the Agora at Athens.

Two interesting maps were found at the Bodleian library: de Gourmont's map of Champagne, 1546, and Mollineux's map of the world, on what is now called Mercator's projection. Only four other copies of the latter exist.

Seventy new poems by Franco Sachetti were published from the Lateran collection by Alberto Chiari, in his *Il Libro delle Rime di Franco Sachetti*.

Prof. Abbott brought out a catalogue of Lord Clinton's extremely important papers, found six years ago at Fettercairn House, concerning Johnson, Boswell, and Sir William Forbes. Hitherto unknown letters by Horace Walpole and by Lord Chesterfield have been brought to light.

The main body of literary discoveries was concerned with the 19th century. The letters of Fanny Brawne to Fanny Keats shed considerable light on the life of Keats, and remove many misconceptions. Finney published a new sonnet of Keats, from Mr. Pierpoint Morgan's *Woodhouse Scrapbook*, and Dorothy Hewlett had a new fragment in her *Adonais, a life of John Keats*. Signora della Robbia also used new documents in her work on Shelley's *Emily*.

E. de Selincourt brought out new letters of William and Dorothy Wordsworth in *The Middle Years*, and Mr. Samuel Romilly discovered the large correspondence of Maria Edgeworth with Lady Romilly. A romantic find was made at Abbotsford of the letters, actually hidden in a secret drawer of a writing-table, of Scott to Charlotte Carpenter.

Peter Quennell published the correspondence between the Princess Lieven and Metternich from 1820 to 1826, and the letters of the Tsar Nicholas to the Empress Marie were brought out for the first time by Dr. Bing.

The sixth volume of the series *Correspondance générale de Marcel Proust* contains Proust's letters to Madame and Monsieur Emile Straus.

**Literature:** see AMERICAN LITERATURE; AUSTRALIAN LITERATURE; BELGIAN LITERATURE; CANADIAN LITERATURE; DUTCH LITERATURE; ENGLISH LITERATURE; EUROPEAN LITERATURE; FRENCH LITERATURE; GERMAN LITERATURE; ITALIAN LITERATURE; LITERARY PRIZES; LITERARY RESEARCH; PUBLISHING; RUSSIAN LITERATURE; SCANDINAVIAN LITERATURE; SPANISH-AMERICAN LITERATURE; SPANISH AND PORTUGUESE LITERATURE.

**Lithography:** see PRINTING.

**Lithuania,** Baltic republic of north-central Europe, N. of Poland, member of the League of Nations. Seat of government, Kaunas (Kovno; 105,370, 1936). President (1932-39): Antanas Smetona. National flag, yellow, green and red horizontal stripes.

**Areas and Population,** including autonomous Klaipeda (Memel, seaport—38,079), but excluding Vilna (10,422 sq.mi.; 1,000,000; with like-named capital—207,750 in 1931—claimed by Lithuania) and Suwalki, in Polish occupation, 21,489 sq.mi.; (1936) 2,499,529 (four-fifths Roman Catholic; Memel is Protestant). Gardinas (Grodno; Polish) 61,600; two other towns ex-

ceed 20,000.

**History, Trade and Finance.**—Theoretically the Diet (49, proportionately elected, 1936) wields sovereign power, but a dictatorship persists; premier, the president's nominee, Juozas Tubelis. Resentment at the Polish tenure of Vilna (see *Encyclopædia Britannica*, vol. 14, pp. 215-16) remains active. Poland threateningly discountenanced a tentative Lithuanian-Soviet rapprochement.

Over three-quarters of the population produce butter, pigs, poultry, eggs, flax, and timber. Imports (1936): 156,060,500 litas (£5,202,000); exports: 190,485,000 (£6,348,000), Britain taking half.

Currency unit: (silver) litas (at par, 48.66 litas = £1 = \$4.87). Budget (1937 estimate): 298,895,256 litas. Notes (Bank of Lithuania; fully covered) and gold (1937): 186,240,000 litas.

**Little Entente.** a political organization binding together the States of Czechoslovakia, Rumania, and Yugoslavia. Created immediately after the World War as an alliance against common dangers threatening these three States (Habsburg restoration, Hungarian revisionism), for which purposes, and those of general co-operation, periodical meetings were held between the three foreign ministers, it was developed in 1929 by the conclusion of a General Act of conciliation, arbitration and judicial settlement between the three countries; and on Feb. 16, 1933, by the adoption of a statute which set up a permanent council, meeting at least three times a year, with an economic council, a permanent secretariat, and any other bodies considered desirable.

Through these organs, the three States were to act as a single unit in foreign policy, on the basis of the Covenant of the League of Nations, the Kellogg Pact, the General Act, etc.

In 1937, regular meetings were held. Yugoslavia's agreements with Bulgaria and Italy were noted with satisfaction. The Little Entente affirmed its friendship with Rome, its adherence to the principles of the League, and its refusal to enter ideological blocs. A more conciliatory attitude was adopted towards Hungary, with whom negotiations were carried on in the autumn (see HUNGARY). A Military Advisory Council was set up in Prague (April 28).

Thus solidarity was preserved; at the same time, the structure of the alliance was undeniably strained by Germany's attacks on Czechoslovakia and her courtship of the other two parties, combined with Czechoslovakia's defensive alliance with the U.S.S.R., which was regarded with disfavour by many groups in Rumania and Yugoslavia.

**BIBLIOGRAPHY.**—See Crane, S. O., *The Little Entente* (London, 1931). (C. A. M.)

**Litvinov, Maxim Maximovich** (1876— ), Russian politician; as agitator and journalist devoted himself from youth to revolutionary propaganda; joined the Social-Democratic Party in 1898, and in 1904, the clash between the Mensheviks and the Bolsheviks, supported Lenin and the latter; participated in many congresses and conferences, and after the revolution (1917) was the Party's plenipotentiary in London, where he was imprisoned for a short time as a hostage. Later he was the U.S.S.R. commercial representative in Estonia, took part in the conferences at Genoa and The Hague, and led the Soviet delegations at the 1927, 1928, and 1929 sessions of the preliminary disarmament commissions of the League of Nations, in 1928 signing the Kellogg Pact for the U.S.S.R. Since 1930 he has been People's Commissar of foreign

affairs (after being for several years assistant); in this capacity he has signed many important agreements, such as the Moscow Protocol with the Baltic States, and the non-aggression pacts with Poland, France, and the Little Entente; and has done much, by his visits to the U.S.A. and European capitals, to regain for his country political contact with the rest of the world. In Dec 1937, M. Litvinov was, under the new constitution, returned unopposed for the Petrograd constituency of Leningrad.

**Livestock.** Except in the United Kingdom, France, Belgium and South Africa, no markedly unusual conditions confronted the livestock industry throughout the world in 1937. England suffered the worst epidemic of foot-and-mouth disease since 1923. Flocks and herds in 21 counties were affected and from March 31 to the end of the year the slaughter of infected and exposed animals, to stamp out the disease, numbered 7,514 cattle, 14,477 sheep, 6,197 pigs and 7 goats. Compensation paid by the Government to the owners of the slaughtered animals was £232,032. Cattle and sheep in France suffered severely from a similar epidemic. In Belgium the loss was confined mainly to cattle. In South Africa a severe drought caused heavy losses of livestock.

The census of livestock on farms in different countries in 1937 was officially reported as follows, the 1936 figures being in parentheses herein for convenience in making comparisons. These reports apply chiefly to the principal farm animals, cattle, horses, sheep and hogs, but where other livestock, such as mules and goats, is of economic importance it is included. These reports are not all of the same dates in 1937 and 1936 as different countries report the livestock census as of different dates. For specific details of each separate livestock industry see CATTLE, HOGS, HORSES, SHEEP, SHOWS and also POULTRY, which is not included in the following reports on the numbers of livestock.

**United States.**—All cattle and calves, 65,930,000 (66,448,000). Sheep and lambs, 52,918,000 (52,588,000). Hogs and pigs, 44,418,000 (42,948,000). Horses and colts, 11,163,000 (11,445,000). Mules and mule colts, 4,477,000 (4,571,000).

**Canada.**—All cattle and calves, 8,840,000 (8,840,600). Sheep and lambs, 3,339,000 (3,327,000). Hogs and pigs, 3,963,000 (4,145,000). Horses and colts, 2,882,990 (2,891,540).

**England and Wales.**—All cattle and calves, 6,614,000 (6,540,000). Sheep and lambs, 17,182,800 (16,648,000). Hogs and pigs, 3,632,300 (3,803,800). Horses and colts, 858,100 (865,600).

**Scotland.**—All cattle and calves, 1,294,000 (1,313,000). Sheep and lambs, 7,503,500 (7,557,000). Hogs and pigs, 242,000 (236,400). Horses and colts, 146,800 (147,000).

**Northern Ireland.**—All cattle and calves, 730,200 (769,600). Sheep and lambs, 828,900 (834,800). Hogs and pigs, 569,400 (521,700). Horses and colts, 90,900 (90,800).

**Irish Free State.**—All cattle and calves, 3,964,000 (4,014,000). Sheep and lambs, 2,988,300 (3,062,000). Hogs and pigs, 956,000 (1,017,000).

**New Zealand.**—All cattle and calves, 4,389,101 (4,254,000). Sheep and lambs, 31,315,818 (30,113,704). Hogs and pigs, 802,419 (808,463). Horses and colts, 277,799 (276,170).

**Germany.**—All cattle and calves, 20,065,000 (20,065,000). Hogs and pigs, 23,707,000 (25,752,000). Sheep and lambs, 4,684,000 (5,997,000). Horses and colts, 3,430,000 (3,407,000). Goats and kids, 2,618,000 (2,630,000).

**France.**—All cattle and calves, 15,762,000 (15,670,000). Sheep and lambs, 9,788,000 (9,558,000). Hogs and pigs, 7,089,000 (7,043,000). Horses and colts, 2,774,000 (2,810,000). Goats and kids, 1,359,000 (1,316,000). Mules and mule colts, 117,000 (123,000). Asses, 203,000 (211,000).

**Italy.**—All cattle and calves, 7,288,810 (7,235,000). Sheep and

lambs, 9,095,000 (8,862,000). Hogs and pigs, 2,813,920 (3,205,690). Horses and colts, 796,490 (816,270). Goats and kids, 1,803,570 (1,794,630). Mules and mule colts, 416,100 (413,720). Asses, 799,830 (805,310). Hinnies, 8,850 (8,100).

**Poland.**—All cattle and calves, 10,547,000 (10,198,000). Hogs and pigs, 7,672,000 (7,059,000). Horses and colts, 3,883,000 (3,824,000). Goats and kids, 403,000 (383,000).

**Czechoslovakia.**—All cattle and calves, 4,595,592 (4,283,071). Hogs and pigs, 3,242,158 (2,744,745). Goats and kids, 1,071,844 (1,000,221). Sheep and lambs, 591,807 (547,000). Horses and colts, 703,835 (695,003).

**Yugoslavia.**—All cattle and calves, 4,073,729 (3,982,359). Sheep and lambs, 9,568,338 (9,211,101). Hogs and pigs, 3,126,241 (2,931,900). Horses and colts, 1,216,085 (1,200,831). Buffaloes, 37,217 (36,946). Mules and mule colts, 17,987 (18,430). Asses, 123,461 (120,925).

**Latvia.**—All cattle and calves, 1,209,949 (1,261,442). Sheep and lambs, 1,333,999 (1,351,632). Hogs and pigs, 739,317 (674,374). Horses and colts, 391,948 (388,770).

**Belgium.**—All cattle and calves, 1,782,840 (1,837,494). Hogs and pigs, 1,054,475 (1,284,465). Horses and colts, 263,104 (231,406).

**The Netherlands.**—All cattle and calves, 2,626,717 (2,569,797). Hogs and pigs, 1,406,366 (1,678,984). Sheep and lambs, 608,333 (654,530). Horses and colts, 299,989 (295,143).

**Norway.**—All cattle and calves, 1,343,245 (1,348,466). Sheep and lambs, 1,739,029 (1,748,600). Hogs and pigs, 445,000 (410,000). Horses and colts, 189,583 (185,468). Goats and kids, 321,655 (331,350).

**Lithuania.**—All cattle and calves, 1,163,000 (1,148,500). Hogs and pigs, 1,183,530 (1,210,000). Sheep and lambs, 1,288,500 (1,275,400). Horses and colts, 549,700 (546,880).

**Denmark.**—All cattle and calves, 3,079,000 (3,107,000). Hogs and pigs, 2,918,000 (3,516,000).

**Hungary.**—All cattle and calves, 1,756,254 (1,741,637). Hogs and pigs, 2,623,530 (2,554,323). Sheep and lambs, 1,483,917 (1,350,442). Horses and colts, 798,066 (794,279). Goats and kids, 36,459 (32,575). Mules and mule colts, 1,257 (1,015). Asses, 4,183 (3,905).

**Switzerland.**—All cattle and calves, 1,637,748 (1,568,251). Hogs and pigs, 935,628 (876,008).

**Chosen.**—All cattle and calves, 1,702,979 (1,679,470). Hogs and pigs, 1,573,590 (1,616,408). Horses and colts, 51,560 (52,608). Goats and kids, 39,534 (34,395). Sheep and lambs, 12,143 (9,388). Mules and mule colts, 1,065 (1,269). Asses, 3,997 (4,369).

**South Australia.**—All cattle and calves, 328,013 (335,354). Sheep and lambs, 7,905,112 (7,945,745). Horses and colts, 200,870 (197,368). Hogs and pigs, 85,047 (93,458). (S. O. R.)

**Local Government:** see MUNICIPAL GOVERNMENT.

**Local Option:** see LIQUOR LAWS.

**Locusts:** see ENTOMOLOGY: *Locusts or Grasshoppers.*

**London.** The population of the county area is now decreasing, and more Londoners live outside the county than within it. In 1937, the estimated population of the county was 4,230,000 (census 1931, 4,397,000) and that of "Greater London" 8,927,000 (census 1931, 8,202,818).

Nineteen thirty-seven was the year of the triennial elections for the London county council and the metropolitan borough councils. The former, held on March 4, resulted in a gain of six seats by the Labour party, whose majority over the Municipal Reformers increased to 26. Lord Snell was unanimously re-elected chairman six days later. At the borough elections on

Nov. 1, the Labour party's success was repeated, and Labour is now in control of 17 of the 28 metropolitan boroughs, having added Hammersmith and Lambeth to those it previously held. The borough elections resulted in the return of 778 Labour members, 598 Municipal Reformers, and 1 Communist—who were chosen by the 35.4% of the electors who troubled to record their votes. The newly-established borough of Edmonton, in outer London, was also won by the Labour party.

The movement on the part of the urban districts within Greater London, though outside the L.C.C. area, to acquire borough status, largely as a bulwark against possible future plans to extend the county area, continued, and seven new boroughs—Edmonton, Romford, Epsom and Ewell, Wembley, Wanstead and Woodford, Beddington and Wallington, and Bexley—came into existence on Nov. 9, 1937; others, including Carshalton, Erith, Dagenham, Chingford, and Coulsdon and Purley, have applications for charters pending. The county of London is now surrounded with a ring of 36 municipal boroughs, all in the metropolitan police area.

The London Passenger Transport board, formed in 1934 to consolidate the passenger traffic facilities within a radius of 20 mi. of Charing Cross, is proceeding with an extensive scheme of tube railway extensions and the conversion of London's tramway system to trolley bus operation. The "Central" (formerly "Central London") tube is being extended to North Ilford, so that its trains may run over L.N.E.R. rails to Ongar and Fairlop in the north-east, and, by means of a new connection with the G.W.R. to Ruislip and Denham in the west; the "Hampstead" tube is being connected at Finchley with the L.N.E.R. lines, now in process of electrification, to Muswell Hill, High Barnet, and Edgware (via Mill Hill), and an extension is planned from Edgware to a point  $\frac{3}{4}$  mi. west of Elstree and rather over a mile from Bushey Heath, whose name it is to bear; the Bakerloo and Metropolitan lines are being connected by a new tube between Finchley road and Baker street, so that Bakerloo trains may be projected to Stanmore. The trams of west and north-east London have already been converted to trolley bus working, and it is anticipated that by the end of 1942, the tram will have disappeared from London. "London Transport," whose passenger receipts for the year ending June 30, 1937, totalled £41,377,929, is now operating 3,154 coaches on its surface and tube railways, 594 trolley buses, 2,060 tramcars, and 6,454 motor omnibuses and "Green Line" long-distance coaches. On May 1, 1937, the bus disappeared temporarily from London streets as the result of a strike of its staff, thus depriving coronation visitors of cheap above-ground transport in Inner London; work was resumed on May 28.

The City proper has seen no great changes during the year. Sir George Broadbridge was succeeded as lord mayor in November by Sir Harry Twyford. The City Corporation has decided to proceed with the construction of a municipal airport at Fairlop, Essex.

No major road improvements in London or its environs were completed in 1937; but the new Chelsea suspension bridge was opened on May 6 by the Canadian premier, Mr. Mackenzie King. The demolition of Rennie's Waterloo bridge was completed, and tenders accepted for its successor, towards the cost of whose construction the Ministry of Transport announced on Dec. 22 that the Government would contribute 60%, thus ending a long-standing controversy between parliament and the L.C.C.; its opening is fixed for the summer of 1940. A decision was taken at the end of the year to apply for powers to duplicate Blackwall tunnel. Wandsworth bridge is being rebuilt, and work will shortly begin on the construction of a lengthy approach road on the south side. Powers were obtained during 1937 to extend the Great West road from Chiswick to Cromwell road in the Earl's Court neighborhood; and the by-pass at the intricate traffic junction at Vauxhall is nearly completed.

The rebuilding of London progresses rapidly. Although in view of the prime necessity of rearmament, work has not yet begun on the new Government buildings in Whitehall, the extensions to New Scotland Yard are in progress. In the City, the extensive new telephone building has greatly changed the appearance of Queen Victoria street. The Adelphi site, between the Strand and the Embankment, was cleared, and the erections of a block of offices and flats thereon begun. Reynolds's house in Leicester square, a building of even greater architectural interest, has also been demolished. In the West End, Bayswater, etc., the process of replacing spacious family mansions by up-to-date blocks of flats has continued at an even accelerated pace; and Vine street police station, to be accommodated in a new building in Savile row (where extensive alterations have been made), is among the well known buildings that are going or have gone. In June, Queen Mary laid the foundation-stone of the new Church House at Westminster; and the new People's Palace at Mile End, replacing the former building burnt down in 1931, was opened at the beginning of the year. Many of the great voluntary hospitals are concerned in rebuilding schemes, among them Westminster (approaching completion), St. George's, Guy's, and the National Hospital, Queen square: the accommodation for research and research-students has at the latter been more than doubled. The new headquarters of the L.C.C. fire brigade, fronting the river at Lambeth, were inaugurated by the King and Queen in July. The increasing work of municipal authorities is causing many of them to seek new accommodation; a fine town hall for St. Pancras in Euston road was opened in the summer, a site has been chosen for a new town hall at Hammersmith, Wandsworth has erected a range of civic buildings, and a town hall for Poplar is in course of erection in Bow road. Work continued on the new London university building in Bloomsbury, inaugurated in 1936, and its now completed tower has become an outstanding London landmark.

Additional sculpture galleries at the Tate Gallery were opened by the King and Queen in June, and the newly organized National Maritime museum at Greenwich came into use, replacing the former Royal Naval museum there.

Slum clearance plans are being actively pressed forward: in 1936-37, 56 areas, involving the displacement and rehousing of 25,460 persons, were cleared, and the L.C.C. erected 7,504 new working-class dwellings, 5,230 of them flats. Clearance schemes are in progress at Battersea, Bethnal Green, Mile End, Southwark, and elsewhere. A loan of £10,000,000 was issued by the L.C.C. in June for health and housing expenditure.

The L.C.C.'s education estimates for the year foresaw an expenditure, including exchequer grants, of £9,767,498 on elementary and £3,617,964 on higher education. The public health of London in 1937 calls for no comment, save for the now customary slight influenza epidemic at the beginning of the year; but Londoners were startled at the end of the year at the news of an outbreak of typhoid at Croydon; the source of infection was traced to a contaminated well. Drastic steps were taken to prevent the spread of the outbreak, which by Dec. 31 had resulted in 30 deaths, 289 cases in all having been notified.

The scheme for establishing a "green belt" round London made progress, additional areas being scheduled for preservation in Middlesex, Buckinghamshire, Surrey, and Essex. The L.C.C. has committed itself to a maximum expenditure of £2,000,000 for this purpose.

In the endeavour to avoid confusing duplications, the L.C.C. has undertaken an extensive overhaul of London street names. Several hundreds of changes were made during 1937, and it is hoped that in two years' time no street name will be used more than once within the county area.

The London fire alarm system has been reorganized and alarms of a new pattern installed. A beginning has been made with the provision of street police boxes, containing first-aid apparatus and a telephone by which the police can be communicated with instantaneously, and 700 such boxes have been erected. A report was issued on July 29 recommending a whole reorganization of the London police court system.

The port facilities of London—used in 1936 by the record figure of 62,169,000 tons of shipping—are being improved by the construction of new overland dock approaches at Shadwell, West Ham, and elsewhere.

The L.C.C.'s budget for 1937-38 provided for a total gross expenditure of £33,545,000 in 1937-38, of which £21,851,450 was to be raised by rates. The county's rateable value is estimated at £60,216,000; its debt on March 31, 1937, was £110,429,881. The average rate levied in the metropolitan boroughs in 1937-38 was 12s. 2d. in the pound; the highest-rated borough (17s. 6d. in the pound) being Poplar, the lowest (9s. 9d. in the pound) Westminster; though it must be noted that, the latter being levied largely on a non-resident population, the rates per head of population in the two cases quoted are £5 10s. 3d. and £39 11s. 2d. respectively. (L. H. D.)

**London Naval Conferences.** During the years 1935-37 a series of naval conferences have been held in London. Of these the most important met on Dec. 9, 1935, and culminated in the signing, at St. James's Palace on March 25, 1936, of the London Naval Treaty of that year. Under this the British Empire, the United States of America, and France undertook, for the period from 1937 to 1942 inclusive, to exchange information about new construction and to refrain from building or acquiring any new warships save those falling within certain qualitative limitations. These limitations were, for capital ships, 35,000 tons, 16-in. guns, and an age limit for replacement of 26 years; for aircraft-carriers, 23,000 tons, 6.1-in. guns, 20 years; for light surface vessels (cruisers and destroyers), 8,000 tons, 6.1-in. guns, 16 to 20 years; and for submarines, 2,000 tons, 5.1-in. guns, 13 years. Definitions of various categories of ships were also fixed by this treaty.

Unfortunately, neither Japan nor Italy, which had attended the conference, would subscribe to the treaty. One of the results of this abstention has been the choice of the 16-in. gun as the heaviest weapon for capital ships, instead of the 14-in. as had been proposed.

During the year 1937 conferences were held in London at various dates between the British Government and delegates from Germany, Soviet Russia, Norway, Sweden, Denmark, and Finland, with the object of arranging for the extension to the fleets of those Powers limitations corresponding to those of the Three-Power Treaty of 1936. As a result of these meetings, two separate treaties were entered into on July 17, 1937, between Britain and Germany and between Britain and Russia, under each of which the same provisions as regards exchange of information, definitions, age limits, and qualitative limitations were agreed to by the contracting parties. Both the German and Soviet Governments insisted on certain exceptions to these conditions as touching their liberty to construct a limited number of cruisers mounting guns of heavier calibre than 6.1-in.

So far no treaties have been signed by Norway, Sweden, Denmark, or Finland, but there is reason to suppose that these four Powers will be prepared to adhere to the limitations fixed by the Anglo-German and Anglo-Soviet treaties.

By far the most important provision of the three treaties above mentioned, and therefore the greatest achievement of the various conferences, is the clause providing for the exchange of informa-

tion about new naval construction. This is designed to avoid the atmosphere of suspicion which is otherwise apt to arise between rival naval powers, an atmosphere which is not conducive to the growth of peaceful relations. (F. E. McM.)

**London, Royal Society of:** see ROYAL SOCIETY OF LONDON.

**London University.** There are now 36 colleges and 24 institutions connected with the university, and 244 professors, 154 readers, and 945 recognized teachers, together with many assistants. Of the recently established chairs, perhaps the most interesting is the Weldon chair of biometry, devoted to the higher statistical study of biological problems, and held by Professor J. B. S. Haldane at University college. A slight drop in the number of students must be recorded for 1937, although in five years the number of internal students has increased by 2,820, the total being 13,613.

Decreases in arts have been almost completely offset by increases in laws, medicine, engineering, and, less noticeably, in science. Apart from London graduates, 446 students from 105 other universities were admitted to advanced and post-graduate courses during 1936-37.

Students make their own arrangements for residence, but there is now accommodation in University college and other hostels, and in inspected lodgings for about one in five. External students are now registered, and arrangements can be made for them to study under advice. Of 6,779 such students, 3,778 are in university colleges and other institutions.

The special lectures continue. These are free to the public and delivered by British and foreign scholars. Last year 152 such lectures were given in 54 courses. Eleven lecturers were from abroad. In 1934 the university, through the Institute of Historical Research, assumed responsibility for the *Victoria County History*. Since then, five volumes have been published and one index, and this year the one-hundredth volume has been completed.

The Senate House block of the new buildings in Bloomsbury is in full occupation. The central library is occupying its new home in the buildings. Royal Holloway and Queen Mary colleges held jubilee celebrations in 1937. (S. J. W.)

**Lorimer, George Horace** (1868-1937), who retired on Jan. 1, 1937 after thirty-eight years as editor of *The Saturday Evening Post*, popular weekly which served as a stepping stone to success for many American writers, died at Wyncote, Pa., Oct. 22, 1937. A brief account of his life may be found in the *Encyclopædia Britannica*, Vol. 14, p. 395.

**Los Angeles,** in Los Angeles county, California, has an area of 442 sq.mi.; its present population is approximately 1,400,000, compared with 102,479 in 1900. It is governed by a mayor (Frank L. Shaw) and fifteen district councilmen. During 1937 death removed three prominent citizens—Doctor John R. Haynes, "father of municipal ownership," president of Los Angeles Water Board; Henry M. Robinson, banker, publicist, philanthropist, and William M. Bowen, attorney, known as "father of Exposition Park." Building projects include a Federal building, costing \$7,280,000, and the Union Railway Station, costing \$10,000,000. Building permits for year, approximating \$65,000,000, include 6,500 single family dwellings.

Vierling Kersey, previously State superintendent of public instruction, assumed superintendency of the city school district in Feb. 1937. Total school enrolment, kindergarten to junior college, was nearly 400,000 pupils. A total of 536 school buildings were

authorized for rehabilitation or construction since the earthquake of March 10, 1933, and a building program, almost completed, was made possible by Federal grant through the Public Works Administration. Earle R. Hedrick succeeded Ernest C. Moore (retired) as provost of the University of California at Los Angeles; the University of Southern California announced a gift of an art gallery and private collection by Mrs. Walter Harrison Fisher; Occidental college celebrated its fiftieth anniversary; George Pepperdine college, dedicated to fundamental Christian ideals, opened to students in September. Cultural events included "Symphony under the Stars" in the Hollywood Bowl, a grand opera and Bach festival, an exhibit of paintings by the Los Angeles Art Association, and numerous exhibits in the Los Angeles museum.

The Metropolitan Water District, comprising Los Angeles and twelve other cities, will supply an abundance of water from the distant Colorado river for domestic and industrial purposes. The main aqueduct (242mi. long with 108mi. of hard rock tunnels) will be completed in 1939 with a capacity of 1,000,000,000 gals. daily.

Los Angeles county is the "Industrial giant of the West." Some 200 new industries were located during the year at an outlay exceeding \$6,000,000. The total 1937 industrial production was approximately \$1,000,000,000. Strikes and minor disturbances, in persistent effort to unionize labour, brought some uneasiness; but the city remained the leading open-shop centre of the Pacific coast, with clearer recognition, however, of collective bargaining. Automobiles in the city numbered 504,587; in the county, 956,974. More than 1,700,000 motor passengers visited the city during the year, spending \$216,700,000. Approximately 1,000 deaths from automobile accidents were recorded. Improvement as a railroad centre resulted from the introduction of rapid streamlined trains, the Union Pacific's "City of Los Angeles" observing a regular 39½-hour schedule between the city and Chicago. Announcement was made of the withdrawal of the luxury steamers of the Grace Lines from California and intercoastal service. Motion pictures represented an investment of \$2,000,000,000, with the season's estimated production outlay at Hollywood studios of \$165,000,000.

Los Angeles harbour took second place in America in total tonnage, with water commerce for 1936 of \$925,754,186. Petroleum was the chief export, lumber, the heaviest import.

The agricultural products of Los Angeles county amounted in 1937 to \$80,000,000. While the severe freeze of January rendered 40% of the citrus fruit on trees unfit for shipment, higher prices brought compensation, the California Fruit Growers' Exchange shipping 53,771 carloads, valued at upwards of \$82,500,000.

(R. D. HU.)

**Louisiana,** first State carved from the Louisiana Purchase, admitted to the Union in 1812, popularly known as the "Pelican State" or "Creole State"; area 48,506 sq.mi.; population according to U.S. census of 1930, 2,101,593; estimated Jan. 1, 1938, 2,150,000. Capital, Baton Rouge, 30,729. The only cities with larger populations are New Orleans: 458,762; Shreveport, 76,655.

Of the State's population 833,532 are urban, or 39.7%; 1,318,160 whites; 776,326 coloured; 2,064,517 native born; 37,076 foreign born.

**History.**—The Legislature did not meet, and no important constitutional changes or elections occurred during the year. Notable progressive movements were: stimulation of the cattle industry by eradication of the cattle tick; liberalization of the State's attitude toward industry, resulting in expenditure of \$50,000,000 in construction of new manufacturing establishments and ex-

ansion of existing ones; development of an elaborate social security program, including expansion of the charity hospital system and the institution of free travelling dental clinics for the poor; improvement in transportation facilities, by elimination of grade-crossings, construction of more farm-to-market roads, and beginning of work on the combination highway and railway bridge over the Mississippi at Baton Rouge; extension of the rural electrification system, enlargement of the soil-conservation program; and large expenditures on public improvements by the State and its municipalities.

Principal State officers: Richard W. Leche, Governor; Earl K. Long, Lieutenant-Governor; E. A. Conway, Secretary of State; P. Tugwell, Treasurer; L. B. Baynard, Auditor; G. L. Porterie, Attorney-General; T. H. Harris, Superintendent of Education.

**Education.**—Education is free and compulsory for all children. Separate schools are maintained for white and coloured. Nearly 100,000 pupils are enrolled in elementary and high schools, 10% of whom are in private and parochial schools. The State provides free textbooks and supplies for all pupils in public, private, and parochial elementary and high schools. Centralized administration, effective supervision, well-trained teachers, adequate buildings and equipment, consolidation, emphasis on vocational education, equalization of educational opportunity, and increased financial support, characterize the public school system. Night classes for adults are rapidly reducing illiteracy; and a State system of free library service is maintained.

Institutions of higher learning supported by public funds are: Louisiana State university, Baton Rouge; Louisiana State normal college, Natchitoches; Louisiana polytechnic institute, Ruston; South-western Louisiana institute, Lafayette; South-eastern Louisiana college, Hammond; Southern university (coloured), Shreveport. The more important endowed and denominational institutions are: Tulane university, New Orleans; Loyola university (Catholic), New Orleans; Centenary college (Methodist), Shreveport; Louisiana college (Baptist), Pineville; Dillard university (coloured), New Orleans.

**Charities and Correction.**—The State maintains the following: charity hospitals at New Orleans and Shreveport, with several others being established under the new social security program; insane hospitals at Jackson and Pineville; schools for the deaf and the blind at Baton Rouge; training school for feeble-minded at Alexandria; Soldiers' home at New Orleans. There are also numerous private and endowed hospitals and orphanages. The State maintains three prison farms for adult offenders, and separate training institutes for male and female juvenile delinquents.

**Banking and Finance.**—There are about 120 State and 30 national banks, with total assets of \$400,000,000, deposits of \$100,000,000, and capital, surplus and reserves of \$50,000,000. The State's bonded debt is approximately \$150,000,000; assessed valuation of property \$1,500,000,000; annual State budget \$40,000,000.

**Agriculture, Manufactures, Mineral Production.**—Cotton, sugarcane, corn, rice, sweet and Irish potatoes, and hay are the chief staple crops. Dairying, stock-raising, citrus fruit culture,

RICHARD W. LECHE, governor of Louisiana

and truck and vegetable gardening are also important agricultural activities. Louisiana is a heavy producer of lumber. About 1,600 industrial establishments, with 70,000 employees, receiving \$50,000,000 annually in wages, produce commodities valued at \$500,000,000.

Principal manufactures are lumber and other wood products, oil and other cotton-seed derivatives, rice products, paper, refined sugar, petroleum products, carbon-black, chemicals, canned vegetables and sea-foods, and tropical clothing. Petroleum, natural gas, salt and sulphur are the chief mineral products, with combined annual value of \$100,000,000.

(W. PR.)

**Loyalty Oath,** an oath required of teachers in certain of the American States. A customary form of this oath is "I do solemnly swear, or affirm, that I will support the Constitution of the United States, the constitution of the state of . . . , and the laws enacted thereunder, and that I will teach, by precept and example, respect for the flag, reverence for law and order, and undivided allegiance to the government of one country, the United States of America."

The oath is required from teachers in 21 States as follows: 1866, Nevada; 1917, Rhode Island; 1921, Colorado, Oklahoma, Oregon, South Dakota; 1925, Florida; 1928, West Virginia; 1929, Indiana; 1931, California, Montana, North Dakota, Washington; 1934, New York; 1935, Arizona, Georgia, Massachusetts, Michigan, New Jersey, Texas, Vermont. The Loyalty Oath, intended by its supporters as a safeguard of the sovereignty of the Republic, is associated by its opponents with a tendency to the excessive development of patriotic exercises, saluting of the flag, state supervision of history books, compulsory non-teaching of evolution and other real or alleged encroachments on the freedom of the academic profession.

**Ludendorff, Erich** (1865–1937), chief strategist of the German Army during the World War, died in Munich, Dec. 20, 1937. Since his war exploits, described in detail in the *Encyclopædia Britannica*, Vol. 14, pp. 469–471, he had unsuccessfully attempted to gain political influence. He was prominent in plots for return of the Hohenzollerns in 1920 and was tried for treason because of participation in the beer hall putsch of 1923. Elected as a Fascist member of the Reichstag in 1924, he showed to such poor advantage that he ceased attendance. He was a candidate for president in 1925, but received only a few votes. Soon thereafter he not only was involved in lengthy marital difficulties but attacked Christianity and urged a return to the worship of Thor and Wodin. Although not openly opposed to Hitler, he did not participate in the Nazi régime because of his desire to restore the monarchy and his contempt for the Brown Shirt military program. Just as Hindenburg grew in popular esteem following the War, so Ludendorff lost favour until even his war accomplishments were disputed.

**Ludwig, Ernst** (1868–1937), former grand duke of Hesse, was born, Nov. 25, 1868. He was a son of Princess Alice, a daughter of Queen Victoria, and a brother of the Russian Czarina. Although the estates which he owned while ruler of Hesse were valued at over two hundred million marks (old type), it was not until after several years of litigation following his abdication in 1918 that he won an annual income of \$400,000. He was known throughout his life as a patron of the arts and a philosopher. He died in Darmstadt, Oct. 10, 1937.

**Lumber** production in 1937 in the United States is estimated at about 26,000,000,000 board feet, a gain of 7% over 1936, but below the normal production of 38,000,000,000 and far

from the peak production of 46,000,000,000 in 1909. Production comes principally from the North-west and South, the former producing about 6,500,000,000 board feet of Douglas fir and the South about 7,000,000,000 board feet of yellow pine. The leading States in order of production were Washington, Oregon, and California. The leading Southern States in order of production were Mississippi, Louisiana, Arkansas, Texas, Georgia, Florida and North Carolina.

Lumber production in 1937 was characterized by unfavourable weather and also the maritime strike and other labour troubles on the West coast. Still later the Japanese war curtailed lumber exports seriously, as Japan and China normally require a large volume of American lumber. Prices reached a new 12 year peak in the spring of 1937, but declined sharply in the fall. Lumber exports increased about 10% over 1936.

Production in 1937 was characterized by: the devising of new outlets to save or use waste material accumulated in large quantities at the sawmills (sawdust, slabs and edgings have formerly been burned or disposed at considerable expense); expansion in making briquettes from lumber waste, particularly pine shavings in the North-west; the use of insulating material made from redwood bark, of which there is an enormous accumulation; the further refinement at sawmills of semi-manufactured products; and the increased use of the small sawmill producing not over 10,000 board feet per day.

Lumber continues to be shipped in large volume through the Panama canal, from the centre of production, the North-west, to the centres of consumption—the North-east and Middle Atlantic States. The Swedish gang saw was introduced as a factor in lumber production and tended to produce accurate and well-sawn lumber, especially common boards and two-inch dimension, at lower cost. The portable band mill continued to replace the circular sawmill, the latter being very wasteful because much wood is converted into sawdust, whereas the narrow kerf of band saws results in less loss.

Wood is continuing to improve its standing as an engineering material. Improved grading processes and better manufacturing processes tend to give lumber a higher standing as a structural building material. The use of metal connectors to improve the strength of timber joints in heavy construction has made definite headway, while the increased use of structural plywood in home construction has made notable progress.

In April 1937, 140 leaders in public and industrial fields met in Washington upon invitation of the National Lumber Manufacturers' Association in an attempt to formulate a program whereby the nation's forest heritage could be better conserved and made continuously productive. Thus the leaders of the lumber industry have definitely favoured a program of forest management to serve the best interests of the country and to make available for the industry a continuing supply of raw material, that is, sawlogs.

(N. C. B.)

**Lustig, Alessandro** (1857-1937), Italian pathologist; born at Trieste. After graduating at Vienna, he steadily built up an international reputation through his work in pathology and bacteriology, having studied bubonic plague in India, and leprosy and malaria in the Argentine and Brazil. As professor of general pathology in the Florentine university since 1890, he wrote his great work, the *Trattato di Patologia Generale*. He was also a member of the Italian senate. He died at Marina di Pietrasanta, Italy, Sept. 24, 1937.

**Lutherans.** The most reliable statistics available at the beginning of 1937 gave the number of Protestants in the world as 135,000,893. Of that number, Lutherans were re-

ported as 63,108,842. The Lutherans are found in all parts of the world, located geographically as follows: Africa, 376,977; Asia 432,893; Europe, 56,662,429; North America, 4,983,134; Oceania 348,704; South America, 304,705.

The Lutheran Church is organized under various forms of government, usually in conformity with the political government in the different countries, with no world organization except the "Lutheran World Convention." This organization came into existence in 1923, as the result of co-operative interest in the relief of distress following the World War, and includes the vast majority of Lutherans in its membership, especially in Europe and America. This body accepts the historic Lutheran Confessions of faith as its basis of unity, and the common call to Christian service as its basis for co-operation. At the 1937 meeting of the executive committee, it was decided to hold the next meeting of the Convention in the United States in 1940. First steps were taken by this body in 1937 to define a basis and specific terms for Lutheran participation in major world movements with other Christian bodies.

Political conditions in Germany continue to press great problems upon the Lutherans in that country, where the church has been so closely connected with the State for such a long time. Changes in the form of civil government have made adjustment in relationship a necessity. The problems of religious liberty, in the existing order, without disestablishment, or disestablishment without disastrous dismemberment, have not yet been solved. The vast majority of Lutherans in Germany are steadfast in their purpose to maintain religious liberty and to find a way, at the same time, by which they may give loyal support to their Government. The trials in these perplexities have strengthened appreciation of spiritual values. Faith in God is the source of hope and courage in the struggle to find the way through.

The Lutheran Church in America has been characterized by two things during the year 1937. First, aggressive movements, in every major body, for the betterment of spiritual conditions and for the extension of every form of Christian service; and, second, conferences between official representatives of independent groups in the interest of a unity and co-operation which will include all Lutherans in America.

(W. H. G.)

**Luxemburg,** independent grand-duchy, Europe, S.E. of Belgium (commercially allied). Capital, Luxembourg (57,740). Ruler, Grand-Duchess Charlotte (born 1896; succeeded 1919). Government, Catholic-Liberal (1937). Area, 90 sq. mi.; population, 296,913 (mainly Catholic), one-third agricultural; iron mines. Communist Party dissolved by law (1937). Currency, franc (=1.25. Belgian francs; 1935). (H. Fw.)

**Lynchings.** Eight lynchings in the United States during 1937 brought the gruesome total since 1882 to 5,111. All eight victims were in the custody of the law. Three were taken by mobs from jails; five from peace officers. All eight were Negroes; only one was charged with rape. But though the total of those lynched was four less than in 1936, seventeen less than in 1935, and but half of the number lynched in 1934, the method of mob execution of two of 1937's victims shocked the entire country by its savagery. Roosevelt Townes and "Boot Jack" MacDaniels, charged with murder, on April 13, 1937, were tied to trees by a mob at Duck Hill, Miss., stripped of their clothing and tortured to death with blow torches.

News of this bestiality caused a profound reaction when it was dramatically announced on the floor of the lower house of Congress where debate was then in progress on the Gavagan bill to make lynching a crime punishable by the Federal Government instead of leaving it to the several States. Two days later the House

LOGGER at the start of a climb to saw off "top," the upper part of a 200-foot fir tree in the Pacific North-west

HALF WAY UP. Loggers performing this work are called "rosinbellies" because they rub against the resinous bark in climbing by means of a rope sling

THE "ROSINBELLY" leans back in his sling to chop off an impeding branch

A CROSSCUT SAW is used to cut off the top of the tree

WILL THE FALLING TOP break clean, or will it split the trunk and hurl the logger to death?

A CLEAN, SAFE BREAK, but the trunk sways so violently the logger must cling desperately

THE SEVERED TOP, weighing several tons, crashes into the forest

THE JOB FINISHED, the tree will be used as a mast for cables to convey logs to the nearest stream

LYNCHINGS in the United States: number each year since 1900

of Representatives passed the bill by a vote of 277 to 119. In the Senate the bill became entangled in a welter of other legislation towards the end of both the regular and the special session. The Senate set the bill as the first measure to be considered in the regular session of Jan. 1938, and it must be "the unfinished business of the Senate until disposed of."

Thus, public opinion of the United States seemed, as 1937 came to an end, about to move the American Congress to enact legislation which would place the power of the National Government against lynch-law. Public opinion polls indicated that 72% of the people of the United States favour the law and, perhaps, even more significant, that 59% of the inhabitants of the Southern States, where all of 1937's lynchings occurred, favour Federal anti-lynching legislation.

The Wagner-Van Nuys-Gavagan bill lays its chief emphasis on punishment of wilfully derelict peace officers and on financial penalties on counties which permit lynchings within their borders. But even more important, American public opinion seemed, as the year closed, united against lynch-law.

(W. WH.)

**MacDonald, James Ramsay** (1866-1937), British statesman; born at Lossiemouth on the Moray Firth, Scotland, Oct. 12, 1866. When, following the financial crisis of 1931, MacDonald's second Labour Government fell, he remained as prime minister of the National Government. He was president of the Lausanne Conference, 1932, and of the World Economic Conference, 1933, and in the latter year visited President Roosevelt in Washington. In June 1935, owing to failing health, he resigned the premiership and took the office of lord president of the council. In the general election of Nov. 1935, MacDonald was the object of a peculiarly bitter attack by the Labour Party in his constituency of Seaham, and was overwhelmingly defeated; but in Feb. 1936 he was returned at a by-election for the Scottish universities.

In May 1937, together with his successor in the premiership, Earl Baldwin, MacDonald resigned from the cabinet, refusing the offer of a peerage. It was while he was on his way, accompanied by his daughter Sheila, to South America to enjoy a long rest, that MacDonald died suddenly on board the liner "Reina del Pacifico." His body was brought from Bermuda by the cruiser H.M.S. "Apollo," and was interred at Lossiemouth, his family having declined the offer of burial in Westminster Abbey. He died at sea, Nov. 9, 1937. For details of his life see *Encyclopædia Britannica*, Vol. 14, pp. 556-7.

**McDowell, William Fraser** (1858-1937), retired bishop of the Methodist Episcopal Church of America, was born at Millersburg, Ohio, Feb. 4, 1858. Following his graduation from the divinity school of Boston university in 1882, he held pastorates in various Ohio towns before being summoned to the chancellorship of the University of Denver in 1890. He returned to church work as corresponding secretary of the board of education of the Methodist Episcopal Church (1899-1904), resident bishop of Chicago (1904-16) and resident bishop at Washington, D.C. (1916-32). At the general conference of 1936, he offered the plan which was adopted for uniting the Northern and Southern Methodists. Bishop McDowell was a world peace advocate and was for many years chairman of the Washington office of the Federal Council of the Churches of Christ in America. An eloquent speaker, he delivered annual lectures at Vanderbilt (1910), Yale (1917), Ohio Wesleyan (1924), and Drew (1933). Among his works were *In the School of Christ* (1910), *A Man's Religion* (1913), *Making a Personal Faith* (1924), and *Them He Also Called* (1929). He died in Washington, D. C., April 26, 1937.

**Machinery and Machine Tools.** The progress made during 1937 in the standardization of steels has been invaluable to the machinery and machine-tool maker. In reducing the number of steels cast to definite specifications, the scope of each has been widened to cover a larger field of application than hitherto, so that the choice of the right steel for the particular requirements of the manufacturer is much less problematical. With the standardization of steels has also come a greater knowledge of the use of the many and various alloys, and this, combined with more correctly applied metallurgical control of heat-treatment, has greatly benefited the finished product.

At least one result of the progress in this direction is the reduction effected in the noise of reciprocating or revolving motions, particularly noticeable where gearing is concerned, the smaller gears now used being much quieter, although running at higher speeds than previously. The most important contribution to quieter gearing is, however, the grinding of the gear tooth profile after hardening.

The year under review has seen important changes in machine design to ensure the rigidity so necessary to obtain full advantage of the tungsten and molybdenum cemented carbide and other super-cutting tools now available.

Instead of relying on the weight of masses of metal to give the desired result, a more correct distribution of metal with adequate cross bracing between main members has increased production capabilities very considerably. A wider application of nitrided steels, having the hardest-known surface attainable, has also taken place, particularly in the use of nitralloy spindles for grinding machines where maximum rigidity is essential. At the high speeds at which such machines are run the nitrided case is able to preserve a stability in the spindle at working temperatures above normal, with the result that it has been possible to reduce bearing clearances from 0.0015 in. (0.038 mm.) down to 0.00025 in. (0.0062 mm.).

In conjunction with this, special spindle-bearing lubricating oils have been produced with a greater viscosity to withstand temperature variations, and the degree of rigidity thus obtained results in a higher finish on the work and less rapid wear on the grinding wheel.

A further notable advance is a patented grinding wheelhead, which goes a step farther by using an oil-pressure controlled spindle bearing on which the load is constant, so that no looseness of the spindle can occur with lowered oil viscosity and bear-

g expansion due to increased running temperatures.

The mention of oil as a controlling medium brings us also to the extended use of hydraulic speed and feed mechanisms in place of mechanical ones. From its considerable development in the grinding-machine field, it has now been applied to many other types such as lathes, shaping, planing, drilling, milling, and grinding machines. Principal among its advantages are: (1) lockless reversal for reciprocating motions; (2) an infinite range of feeds and speeds within defined limits, and (3) the mechanism simpler, and contains fewer moving parts than that for mechanical operation.

The cemented carbide cutting tools previously mentioned have now passed from their experimental stage to one of established use, but, due to their phenomenal metal-removing capabilities, 1937-designed machines have had to provide still greater swarf clearances in bed designs and even mechanical methods of removing the cuttings have been devised to prevent swarf congestion. The use of this product of the metallurgist has also been extended considerably during the year to the manufacture of dies and moulds for metal extrusion purposes.

The reduction of idle time in machine operation is a very important factor in the endeavour to increase production, and during the period under review, very considerable improvements have been made. Perhaps the most outstanding is the multi-spindle fully automatic machine which completely finishes work from the bar, not only at rates of production never before achieved, but to a very fine degree of accuracy. The fully automatic grinder is also another of the machines to have been improved considerably in design and performance.

On machines of a less fully automatic operation, we find that the reduction in idle time is linked up with a greater concentration on reducing operator fatigue. Several features of design are affected by this, but the machine controls naturally have come in for the most attention. On many machines the number of levers and handwheels has been reduced to the minimum, and these are more intelligently grouped for complete and immediate control from the operator's working position. Where more than one working position is essential, such as with certain types of milling machines and lathes, speed and feed controls are duplicated, so that full control is available for the operator from the position most suitable for the work in hand. The use of the single lever control was extended during 1937 to a wider range of machines, several motions being operated on the "joy stick" principle, and in certain applications the direction of lever movement indicating the direction of the motion. Single lever dial speed and feed selectors were also adopted on a wider scale.

The motorization of the machine tool was carried a step farther by fitting motorized spindles to certain high-speed machines, the spindle of the machine forming the armature shaft of the motor. Another important innovation was the overhead busbar system, which allows the power distribution system for individually driven machines to be installed in a shop before the machines are in position, and subsequently enables the layout to be altered at any time by merely disconnecting the machines from plug-in fuse boxes.

A feature of 1937 was the very high degree of accuracy demanded from the manufacturer by the machine-tool user, which led to the wider adoption of systems of fine tolerances. A further result was the production by specialists of such components as ground lead screws of an accuracy unobtainable by the average machine-tool manufacturer.

(W. J. T.)

**MacMonnies, Frederick William** (1863-1937), American sculptor, whose most ambitious undertaking of recent years was the Marne Me-

morial Monument erected at Meaux, France, in 1926 as the gift of the American people. In 1933 his controversial "Civic Virtue" which had stood for many years in City Hall park, New York city, was removed to Foley square. In the same year he was made a commander of the Legion of Honour by the French Government. He died in New York city, March 22, 1937. An account of his career may be found in the *Encyclopædia Britannica*, Vol. 14, p. 596.

**McNeile, Cyril** ("SAPPER") (1888-1937), British novelist. He was educated at Cheltenham college and the Royal Military Academy, Woolwich, and joined the Royal Engineers in 1907. He was promoted captain in 1914 and retired as lieutenant-colonel in 1919. Known chiefly as an author using the pseudonym "Sapper," his novels included: *Sergeant Michael Cassidy*; *Men, Women, and Guns*; *No Man's Land*; *Mufti*; *Bulldog Drummond* (1920); *The Man in Ratcatcher* (1921); *Jim Maitland* (1923); *The Final Count* (1926); *Temple Tower* (1927); *Tiny Carteret* (1930); *The Island of Terror* (1931); *Ronald Standish* (1932). His play, *The Way Out*, was produced in London (at the Comedy theatre) in 1930, and just before his death he had collaborated with Gerard Fairlie in another play, *Bulldog Drummond Hits Out*, produced in July at the People's Palace, London. He married Violet Douglas, and had two sons. He died at Pulborough, Sussex, Aug. 14, 1937.

**Madagascar.** An island separated from S.E. Africa by the Mozambique channel; a French colony; governor-general, Leon Cayla; area, c. 241,094 sq.mi.; population (1932), including Mayotte and Comoro islands, 3,772,570.

The economic situation during 1937 was satisfactory. Agriculture in particular has made important progress. The cultivation of spices, vanilla, and rice has improved both in return per hectare and, often, in quality. The production of coffee has amounted to more than 27,000 tons. These results are the more noteworthy in that one of the richest agricultural districts of Madagascar, the hinterland of Diego Suarez and Majunga, was devastated by a cyclone in the spring of 1937. At Diego itself, houses, drains, and electric and telephonic systems all had to be reconstructed.

An important program of economic undertakings has been carried out. In the extreme south (the Autandroy district), traditionally looked upon as the dried-up country, works of hydraulic agriculture have made possible the irrigation of several thousands of hectares. In the north, destruction caused by the cyclone was repaired, and maritime works begun or further enlarged at Diego Suarez and at Majunga, also at Tamatave. Madagascar was faced in 1937 with a very delicate social problem in the shape of the assimilation of a considerable number of Chinese labourers employed in agriculture.

**Madden Dam:** see PANAMA CANAL AND CANAL ZONE.

**Madeira.** Portuguese island, in the Atlantic ocean, 350 miles off N.W. Africa, largest (270 sq.mi.) of a group (sometimes "The Madeiras"; officially, Funchal district of Portugal; area, 314 sq.mi.; population, 211,601 [1930]; density, 673.8 per sq.mi.; capital, Funchal, seaport, 52,082), including Porto Santo and three uninhabited islands. Its 10 communes are: Calheta (20,193), Camara de Lobos (17,578), Machico (17,343), Ponta do Sol (12,520), Porto Moniz (5,910), Porto Santo (2,416), Ribeira Brava (16,309), Santa Ana (9,814), Santa Cruz (24,551), São Vicente (9,182). Agriculture occupies the Portuguese-Moorish-negro, and -Italian inhabitants. Products: wine, sugar, bananas; home industry, embroidery. (H. Fw.)

**Madrid**, capital city of Spain. A description may be found in the *Encyclopædia Britannica* vol. 14, pp. 616-17. The population (estimate Dec. 31, 1934) was 1,048,100. There are now some 12 mi. of underground railway. Madrid's history in 1937 is the story of its part in the Spanish civil war. It ceased temporarily to be the capital of Spain in Nov. 1936, when the Government moved to Valencia.

General Franco's troops renewed their attacks on the city in early January, accompanying them with severe air-raids; and on Jan. 9 all non-combatants were ordered to leave the city.

Fighting in the Madrid neighbourhood was fierce for several weeks, but at the end of February and in early March the insurgent attacks were repulsed, and in April the "White" troops who had been holding out in the University city were dislodged.

On April 24, the Madrid defence council, under General Miaja, which had controlled the city since the previous November, was superseded by a city council of 20 members representing all the "Popular Front" groups, charged with full authority in civil matters, Gen. Miaja being left in command of the Government troops on the Madrid front. The city was heavily shelled by the insurgents in early June; in July, General Franco's forces renewed their offensive, but were pushed farther back by the defending troops.

It was announced in August that in the 12 months since the beginning of the Civil War, 768 Madrileños had been killed, and 3,567 wounded, as the result of artillery bombardments and aerial attacks.

During the late summer and early autumn there was little fighting in the Madrid area; in September it was announced by the Government that a plot, in which 5,000 persons were said to be involved, had been discovered within the city on the part of a "fifth column" of sympathizers with General Franco.

Severe air attacks on Madrid were resumed in late November and early December, but no serious attempts to take the city by the insurgent land armies were made in the latter part of the year. (See also SPAIN, CIVIL WAR IN.)

**Magazines and Periodicals.** Two major new developments marked American magazine-publishing during 1937: the sudden rise of the large-sized, photographically illustrated "picture magazine," and the appearance of a new flood of pocket sized "digest" magazines.

Ever since Alexander Graham Bell, some 40 years ago, put forward the unheard-of idea of introducing photographic illustrations into the then pamphlet-like bulletin of the National Geographic Society, and over a million readers ultimately proved to like the pictures better than the text, publishers have been playing with the picture-magazine idea. The established newspaper rotogravure sections experimented with picture-presentation techniques, but timidly.

The *Midweek Pictorial*, in semi-magazine form, made tentative efforts to capitalize the evident appeal of pictures. The new tabloid newspapers, on a different plane, served as further indication of the mass appeal of pictures. Large-circulation foreign illustrated magazines such as *L'Illustration*, *Vu*, *The Illustrated London News* stood as possible models. But not until late in 1936, when *Life* appeared, did anyone in America produce a true "picture magazine" whose main purpose was communication to the reader through photographs, the text being largely reduced to captions. *Life*, which stressed the news aspect of pictures, was an instant circulation success. After it, during 1937, came the imitators, most of them echoing *Life's* monosyllabic title, but covering a variety of fields. Among them were *Look*, *Flash!* (a Negro picture magazine), *Foto*, *Photo-History*, *Pic*, *Picture*, *Click*, *See*, *Peek*, *Now and Then*, even a new picture version of

the old *Police Gazette*. By the end of 1937, nearly a score were being published, with an estimated total circulation of 6,000,000 outstanding among them *Life* and *Look* with approximate circulations of 2,000,000 each.

Equally notable has been the new flood of "digest type" magazines. *The Reader's Digest*, originator of the pocket-sized digest idea, was founded in 1922, and for seven years had no imitator. Then, in 1929, when *The Reader's Digest* was first sold on the newsstands, the first flood of imitators began, reaching an eventual total of some sixty. Most were short-lived, and none reached substantial circulations.

During 1937, probably in part because the circulation of *The Reader's Digest*—in excess of 2,000,000—became publicly known for the first time, publishers again became attracted to the pocket size and digest idea, and no less than 33 pocket-sized magazines were launched during the year. Among those pocket-size magazines which directly imitate *The Reader's Digest*, mortality seems to be high: out of 31 which have been launched since the founding of *The Reader's Digest*, 15 have been abandoned; of the remaining 16, most are published abroad, and none is reputed to have a circulation in excess of 60,000; during 1937, only one was begun in the United States. Among those which follow the digest idea but apply it to special fields, success is more frequent: of the 32 such digests begun since 1922, 24 still survive; 13 of these were begun in 1937, covering fields ranging from medicine and business to religion and agriculture. Among the pocket-size magazines which are not actual digests, but have imitated *The Reader's Digest* in format, experience seems to indicate that while the pocket-size is a factor in public appeal, it is not a controlling factor and that such magazines stand or fall principally upon their editorial effectiveness.

Led off by *The American Mercury*, *Coronet*, and *The Commentator*, this latter group was increased by 18 magazines in 1937, covering a variety of fields. In all three groups, there have been since the founding of *The Reader's Digest* something over 110 magazines, with approximately 65 surviving at the end of 1937.

Other activities in the magazine field during 1937 have been less striking. There have been suspensions or absorptions of recent ventures—notably *The New York Woman* and *Today* (the latter combined with *News Week*); one old-established publication, *The Literary Digest*, having suffered a disastrous drop in circulation, was given up by its original owners, combined with *The Review of Reviews*, then sold to new owners again; another, *The Delineator*, under similar circumstances, was sold to and combined with *Pictorial Review*. The five leading review-type magazines have continued efforts to regain circulation and advertising lost, in varying degrees, during the depression—*The Atlantic* adding a serialized novel, *Harper's* and *The Forum* being carried on without substantial change, *The American Mercury* continuing with apparent success its new pocket-size format, *Scribner's* continuing its large-size illustrated format and initiating a "controlled-free-circulation" idea new to general magazine publishing.

The "pulp" magazines continue their growth; at the end of 1937 there were some 150 being published, with a total circulation which had increased from 7,000,000 to 10,000,000 in five years—an increase perhaps in part explainable by the gradual coming-of-age of second generation foreign-language groups. (See also ADVERTISING.)

(DEW. W.)

**Maginot Line:** see ARMIES OF THE WORLD: *Maginot Line*.

**Magnesite.** World production of magnesite in 1934 came back to its former level, with somewhat over 1,000,000 metric tons, and while later figures are incomplete, it seems likely

at current production is in the neighbourhood of 1,500,000 tons. The leading producers are the Soviet Union, Austria, United States and Greece, which together account for about 80% of the total. The United States output is far below the requirements, one-quarter to one-third of which must be supplied by imports, most of which come from Austria and Czechoslovakia. Recent years have brought reports of Russian outputs that are so large in comparison with internal needs and visible exports that the figures have been received with considerable skepticism in the industry. Since otherwise only Greece and the United States have reported outputs in excess of the pre-depression high, it is largely the Russian figures that account for the apparent increase in production.

(G. A. Ro.)

**Magnesium.** Although magnesium metal has been produced on a small scale for a limited number of uses for a long period of years, it is only since 1922 that its real commercial development began. The metal is now used extensively in a wide variety of light metal alloys, and plant capacity and production are expanding so rapidly that it is difficult to determine current outputs; recent world totals have been estimated as low as 5,000 metric tons, and as high as 50,000 tons. The producing countries include Germany, United States, France, Switzerland, United Kingdom, Japan, Soviet Union, and Austria, while a small plant has been authorized in Italy and another is planned in Australia. Germany leads in production, but no specific figures are reported and estimates range from 8,000 to 35,000 tons. Austria has only a small experimental plant, operated intermittently, and the Russian output is also small. Switzerland produces about 700 tons, and the United States 1,000 tons; the position of the others is uncertain, but the outputs are apparently of the order of 1,000-2,000 tons, although that of Japan has been expanding rapidly, and may have exceeded this amount.

(G. A. Ro.)

**Mail-Order Business.** A commercial enterprise which carries on its retail transactions almost entirely by mail and is most prominent in the United States. In common with most businesses, mail-order firms suffered materially during the depression beginning in 1929. For instance, the combined mail-order and retail store net sales of Sears, Roebuck and Co., the largest mail-order house, sank to \$289,289,000 in 1933, but by 1936 had recovered to reach an all-time high-point of \$494,968,000. A similar comparison of the sales of the three largest mail-order houses, Sears, Roebuck and Co., Montgomery Ward and Co., and Spiegel, Inc., is instructive: in 1933 their combined net sales were \$570,551,000; in 1936, \$900,960,000. This gratifying recovery led the three largest mail-order firms to embark on their 1937 programs with a reasonable degree of optimism, and in each case their sales increased for each of the first ten months of 1937 over the same months of the preceding year. Figures for the full year of 1937 were not available at the time of writing, but for the first ten months the combined net sales of Sears, Roebuck and Co., Montgomery Ward and Co., and Spiegel, Inc., were \$843,459,000.

An examination of their month-by-month reports reveals that the ratios of increase became smaller as the year progressed. The upward tendency in the sales curve became more pronounced during the autumn of 1937, when the seasonal upswing of business in general was less than normal.

The increased business noted above is to some extent attributable to large quantity purchases and to operating economies peculiar to the mail-order business, both of which have enabled these companies to raise the general standard of living by making more goods available to consumers at a price lower than they would otherwise have paid. Throughout their history they have

obtained their large sales volume by offering, as a rule, better quality merchandise at the same price, or the same quality at a lower price.

Certain tendencies in the mail-order business have become more apparent recently. Examination of current catalogues reveals an increased emphasis upon private brands: *i.e.* upon merchandise manufactured and sold under the proprietary trade names of the mail-order houses. Such merchandise, placed in competition with nationally advertised brands which are also offered in the same catalogue, has found a ready acceptance with the public. Another tendency is seen in greatly increased installment accounts, which have resulted not from a loosening of credit lines, but by making available more kinds of merchandise to time payment purchasers. For instance, at the close of 1936, the installment account balances of Sears, Roebuck and Co. had increased over the previous year by \$22,000,000, or nearly 68%, attributable in large part to the sale of major household appliances and home modernizing equipment. The installment account balances of Montgomery Ward and Co. increased by \$12,230,000, or 36% over a similar period. This concern, as well as Spiegel, Inc., sells all the merchandise listed in its mail-order catalogue on time payment terms.

In the middle of the 1920's, the two largest mail-order houses, commonly known as Sears and Wards, entered the retail store field. This new activity was largely experimental until about 1928, when the two companies, apparently believing that they had learned enough about retail store operation to justify considerable expansion in this field, opened retail units in a number of communities. By the end of 1937 Sears were operating in the neighbourhood of 480 stores, and Wards in excess of 550. By this time, too, it was clear that the original function of the two mail-order houses had been modified by the added function of acting as jobbers to their own retail stores, for in 1936 and 1937 the over-the-counter sales of both Sears and Wards were somewhat greater than their mail-order receipts.

Despite the success of these two companies in the retail store field, the mail-order system is probably the most economical method yet discovered of distributing goods over a wide area. It is not only economical, but renders a great service to people living in remote sections of the country. The potential market of the mail-order houses is, therefore, still a large one. An aspect of the business under discussion which is often overlooked is its influence—because of its large purchases—on factory production and employment throughout the country. (See also **MARKETING**.)

**Maine,** extreme North-eastern State of the United States, admitted as a State in 1820 and popularly known as the "Pine Tree State," has an area of 33,040 square miles. Population (census 1930) 790,182 (estimated 1938, 800,000). The capital is Augusta, 17,198; the largest city, Portland, 70,810. Of the State's population, 292,793 live in the twenty incorporated cities; in other words, the population is no more than 37% urban.

**History.**—In January 1937 Lewis O. Barrows, of Newport, was inaugurated governor; he was elected in 1936 when only Maine and Vermont out of the forty-eight States remained loyal to the Republican party. In the same month three Republican congressmen, James C. Oliver, of Portland (first district), Clyde H. Smith, of Skowhegan (second district), and Ralph O. Brewster, former governor, of Dexter (third district), took office. Senator Wallace H. White, Jr., of Auburn, was re-elected by a small majority over Louis J. Brann, of Lewiston, retiring and popular Democratic governor. For the first time since 1931 the whole delegation of Maine at Washington was again Republican as in normal times. In 1937 the legislature failed to revise the tax system of the State, but passed legislation that for the first time set

up a merit system for state employees. Perhaps the main political event of 1937 was the defeat by a majority of more than two to one at a state-wide referendum of a law proposing a sales tax to secure revenue for improvement of the public schools and for old age pensions. The legislature summoned in special session late in the year passed legislation providing for the revenue necessary by increasing taxes on liquor sold in the State stores and by cutting appropriations drastically in various State departments. The proposed aid for the public schools was reduced from \$500,000 to \$200,000.

LEWIS O. BARROWS, governor of Maine

**Education.**—In the field of education there was nothing of note to chronicle. A commission reported to the legislature that additional funds amounting to at least \$1,500,000 were necessary from the State to bring the schools, especially those in the more sparsely settled regions, up to reasonable minimum standards. The legislature thought that a third of this amount would be sufficient; even this was defeated in referendum and finally only \$200,000 was voted during the extra session. It is still true that between two hundred to three hundred schools operate on an annual budget of less than \$360 each.

**Industry and Finance.**—The year 1937 saw the greatest number of summer visitors and the highest returns from tourists in the history of the State. No progress was made in the Passamaquoddy bay tidal project which seems to have been definitely abandoned by the Federal Government. The Great Northern Paper Company began a \$3,000,000 hydro-electric development on properties at Nattaseunk. The Central Maine Power Company also started a new power development at Solon to cost around \$1,500,000 over a period of years, while the Bath Iron Works are building more destroyers than any other yard in the world. The deposits in Maine savings banks reached in 1937 the highest total on record. Despite these items of progress that made 1937 an exceptionally favourable year for Maine industries, in the last two months particularly in the textile business Maine felt greatly the national recession.

(K. C. M. S.)

**Maize:** see CORN.

**Malacca:** see STRAITS SETTLEMENTS.

**Malaria.** Malaria continues as one of the most devastating diseases of man. Caused by a protozoan (one-celled animal) parasite which invades and destroys the red blood-cells, and transmitted by the bites of *Anopheles* mosquitoes, its control is a dual problem of curing the patient and eradicating the mosquito. The disease has gradually receded from the cooler temperate zones where agriculture, wealth and education have improved conditions, but in the tropics it has been controlled only where intensive work has been done and large sums of money have been expended such as in the Panama Canal Zone, the Pontine Marshes in Italy and certain commercial plantations in southern Asia. In every malarious region there are natural periods of decline and increase of the disease. At the present time a period of decline in the United States is following a period of increase from 1932 to 1934.

For this reason progress in control can be evaluated only after

a period of years.

An enormous amount of research is being carried on in field stations and laboratories to learn more about the disease and about methods of treatment and prevention. The use of malaria in the treatment of patients suffering from syphilis of the brain has added much to our knowledge of the natural history of malaria. By employing infected mosquitoes to produce the disease the dosage of infecting organisms, the incubation period, the course of the disease, the development of immunity and the effectiveness of treatment have been carefully studied. It has been found that individuals develop immunity to the particular strain of parasite inoculated, but not to other strains, even the same species, and that this immunity persists only a short time after the disease is cured.

There is still a gap in our knowledge of the parasite between the time when it is injected by the mosquito and when it appears in the red blood-cells.

It is now believed that the parasite probably enters the large phagocytic cells of the body where it is protected during its multiplication, and that this accounts for the failure of quinine and other drugs to prevent infection.

Certain advances have been made in treatment. It is now considered advisable to treat the disease vigorously for a week or two, and to treat relapses as they occur, rather than to continue treatment for many weeks. Quinine is still considered the mainstay in treatment, but the new synthetic drug atabrine has proved to be about as efficient as quinine and is more pleasant to take. When either of these drugs is supplemented by small doses of another synthetic drug, plasmoquine, the incidence of relapses is greatly reduced.

Other new synthetic drugs are being produced, some of which may prove to be more effective than those now in use.

In the control of malaria mosquitoes, the treatment of breeding places is constantly receiving more attention. Drainage is the most useful procedure and has accomplished much in the "bonification" project in the Pontine Marshes, and in the Southern United States through labour furnished by the relief agencies of the Federal Government.

The Tennessee Valley Authority has developed scientific control of mosquito breeding along the shores of the lakes formed by the building of dams. The dusting of breeding places with Paris green is used increasingly where drainage is impracticable. The top-minnow, *Gambusia affinis*, although a disappointing agent in devouring mosquito larvae in its natural habitat in the United States, is proving of value in Europe where the absence of its natural enemies allows it to multiply enormously.

The Malaria Commission of the League of Nations, by its studies in many countries, has shown that no one formula can be applied to control malaria, but that each region must be studied carefully before an effective control program can be inaugurated. In the Southern United States full-time malaria units consisting of a physician, an engineer and an entomologist are being added to the staffs of State health departments, and courses of study are being furnished for the training of such personnel. In the development of such programs and in the combined results of many investigations lies the hope of reducing the incidence of malaria in the future.

(H. E. M.)

**Malay States, Unfederated:** see UNFEDERATED MALAY STATES.

**Malta,** island in the Mediterranean, between Sicily and Libya, forming, with the neighbouring islands of Gozo and Comino, a British possession (since 1814), governed since 1934 when the Letters Patent of 1921 granting a Constitution were re-

governed, as a Crown Colony, by a governor aided by an Executive Council; legislation at present is effected by governor's ordinance. Capital, Valletta. Population (census, 1936), including Gozo, 62,165; area (with Gozo and Comino), 120 square miles. The people are mainly of Semitic (Carthaginian) origin, and are Roman Catholics by religion; there is a university, with about 180 students, eight Government higher schools, and over 150 day and evening elementary, and 40 private schools; total expenditure on education, about £145,000 annually. The chief towns are Valletta (pop. 23,000) and the former capital, Civita Vecchia (pop., with the suburb of Rabat, 10,000). Maltese and English are the official languages.

**History.**—Fears have been expressed in some quarters that Italian imperial aspirations may include the attempted annexation of Malta, and the recent Italian fortification of Pantellaria, the island between Gozo and Cape Bon, did not quiet such suspicions; but Mussolini has strongly denied that Italy has any such intentions. Measures have been taken in recent years to reduce Italian influence in the island, and Maltese has (since 1934) taken the place of Italian as the language of Court proceedings.

**Agriculture and Manufactures.**—Cultivation is high, corn crops, fruits, potatoes, and cotton being grown, and there is an extensive fishing industry. Manufactures include lace and cotton goods. Communication is mainly by motor omnibus; Malta and Gozo are connected by a ferry service. Valletta has a magnificent harbour, and is an important port of call for vessels to and from the East.

Revenue and expenditure in 1936-37 were £1,209,000 and £1,251,000 respectively; revenue is mainly from customs, fees, and stamp duties. Imports, in 1936, were valued at £3,440,000 and exports at £647,450. British coinage is in use, with a special bronze coin valued at one-third of a farthing.

**Defence.**—Malta is the headquarters of the British Mediterranean fleet, and of the British air force in the Mediterranean, and has an important dockyard and arsenal. Some 3,500 British troops are stationed there.

**Manchoukuo** (MANCHURIA), an Empire, closely connected with Japan, located in north-eastern Asia, bounded on the north and east by Siberia, on the west by Siberia, Outer Mongolia and China proper, on the south-east by Korea. Its capital is Hsinking; its ruler the Emperor Kangte.

**Area and Population.**—The area is 460,383 sq.mi.; its population (June 30, 1936) 33,836,898, including about 700,000 Koreans, about 230,000 Japanese, about 50,000 white Russians and some 3,500 foreigners of other nationalities, among these 14 British, 459 Germans and 226 Americans. Population of chief cities: Hsinking (1936) 303,301; Harbin (1936) 500,526; Mukden (1935), 388,841; Antung (1935) 154,575.

**History.**—Manchoukuo contains the four former Chinese provinces of Fengtien, Kirin, Heilungkiang and Jehol. Following the Russo-Japanese War of 1904-05 Japan took over and extended Russia's former rights of economic development in South Manchuria. The South Manchuria railway zone, which included considerable sections of the towns of Mukden and Hsinking and constituted a sort of State within a State, was under Japanese administration. Friction between the Japanese and Chinese authorities over such questions as new railway construction, Japanese and Korean rights of land and property ownership outside the railway zone occurred and became aggravated after Chang Tseh-liang, the governor of Manchuria, announced his allegiance to the nationalist régime at Nanking. Matters came to a head on Sept. 18, 1931, when Japanese troops, employing as a pretext the alleged explosion of a bomb on the South Manchuria railway,

occupied Mukden, then the capital of Manchuria, and quickly extended their occupation to the whole of Manchuria. Those groups in Manchuria which were willing to co-operate with the Japanese army selected Henry Pu Yi, heir of the Ching dynasty in China, who had been living in retirement in Tientsin, as chief executive of the new State. Pu Yi assumed office as the Emperor Kangte on March 1, 1934. Meanwhile Jehol had been added to the new State by a swift campaign of the Japanese troops in the spring of 1933. There is no parliament in Manchoukuo. Administration is largely carried on by the State Council, which performs the functions of a Cabinet, while a Privy Council also functions in an advisory capacity to the emperor. While the higher offices in the Manchoukuo administration are fairly evenly divided between natives of Manchoukuo and Japanese, the influence of Japan on all State affairs is overwhelmingly great. The Japanese ambassador to Manchoukuo (General Kenkichi Uyeda), is also commander-in-chief of the Kwantung army, the Japanese army of occupation.

The League of Nations passed a resolution recommending non-recognition of Manchoukuo; and for six years after its establishment Japan and the Central American Republic of El Salvador were the only countries to extend *de jure* recognition. Italy recognized Manchoukuo on Nov. 30, 1937; and Germany maintains a special trade representative in Hsinking. The United States and Great Britain maintain consulates in Mukden and Harbin; and their consuls deal with the established authorities on an informal basis.

**Trade and Communications.**—Manchoukuo's exports and imports in 1936 were valued at 602,758,989 yuan and 691,889,273 yuan respectively. Japan supplied 507,216,093 yuan worth of imports and purchased 237,546,009 yuan worth of exports. Manchoukuo has about 6,000 mi. of railway lines, of which about 2,000 were constructed after the creation of the new State. The principal towns are connected by a regular commercial air service.

**Agriculture, Natural Resources, Manufactures.**—Manchoukuo's most important crop consists of soya beans. Kaoliang, millet corn and wheat are also produced in substantial quantities, together with small amounts of rice, cotton and tobacco. The Mongolian regions of the west and north-west are well adapted to cattle breeding. Manchoukuo in 1935 produced 10,944,234 tons of coal and 1,576,178 tons of iron ore. The country is rich in timber and contains gold deposits, although the yield from the latter has thus far been slight. Manchoukuo has an ambitious five year plan, ending in 1940, for the development of its heavy industries and mining. With a view to promoting the inflow of new capital, a number of industrial enterprises were transferred from the South Manchuria Railway Company to the Japan Industry Company in the autumn of 1937.

**Finances and Banking.**—The unit of currency is the Manchoukuo yuan, equivalent in value to the Japanese yen (29.15 American cents). The budget, which has been increasing in size, amounted to 248,098,760 yuan in 1937. The Central Bank of Manchoukuo controls the note issue; the Industrial Bank of Manchoukuo specializes in crediting industrial enterprises; and there are a number of other Japanese and Manchoukuo banks.

**Education and Religion.**—In 1936 there were 12,884 schools in Manchoukuo, with 667,967 students. Illiteracy is very high, especially in the country districts. The principal religions are Buddhism, Taoism, Mohammedanism and Lamaism. There are about 100,000 Christians in the country.

**Armed Forces.**—Besides the Kwantung army, the size of which is kept secret, Manchoukuo maintains an army of 80,000 and a flotilla of 11 gunboats.

**BIBLIOGRAPHY.**—*Japan-Manchoukuo Yearbook*, 1937; Owen Lattimore, *Manchuria: Cradle of Conflict*. (W. H. CH.)

**Mandated Pacific Islands:** *see* PACIFIC ISLANDS, MANDATED.

**Mandates and Mandated Territories.** The principal subject of interest during 1937 was the Palestine problem, to discuss which the Permanent Mandates commission held an Extraordinary Session from July 30 to Aug. 18.

For a report of the commission's finding in this matter, *see* PALESTINE: *History*.

The mandates commission also held two ordinary sessions during the year. In the first session, May 31–June 15, it examined the annual reports for 1936 of the mandatory powers for Togoland and the Cameroons, and Tanganyika (all British "B" mandates), Nauru and New Guinea (Australian "C" mandate), and S.W. Africa (S. African "C" mandate). In regard to the three "B" mandates in Africa, the commission asked whether the mandatory power considered itself legally obliged to apply the rule of economic equality to imports from states non-members of the League, referring to the fact that neither under the terms of the mandate nor under Article 22 of the Covenant could non-member states claim economic equality for their imports into a mandated territory, but only by virtue of agreements, as the mandatory power maintained, concluded with it. The commission noted that the mandatory power had no intention in any of the three territories to introduce legislation which would dis-

criminate against non-member states. In regard to the Cameroon and Togoland the commission asked to be informed whether the exports of these territories enjoyed reciprocity under the commercial régime in force between them and certain non-member states.

In examining the report on S.W. Africa, the commission referred again to its concern at some of the findings of the S.W. Africa commission (June 1936), particularly in regard to the administration of the mandate as a fifth province of the union which, it noted, was not contemplated, and in regard to which it had made legal reservations; native education it considered to be inadequate.

At its 33rd session, Nov. 9–19, the commission examined the annual reports for 1936 of the mandatory powers for Syria and the Lebanon (French "A" mandates), the Cameroons and Togoland (French "B" mandates), Ruanda-Urundi (Belgian "B" mandate), Western Samoa (New Zealand "C" mandate), and Pacific Islands (Japanese "C" mandates).

The accredited French representative from Syria and the Lebanon (*qq.v.*) made a statement on the various documents communicated to the commission dealing with the signature in Sept. and Nov. 1936, of treaties between France and the two mandated territories, providing for the termination of the French mandate in 1940. As the question of their emancipation did not arise until that date the commission merely took note of the documents.

*Mandated Territories*

Territory	Approximate Area	Date of Mandate	Mandatory Power	Former Title	Former Administration
<i>South-west Africa</i> , including Caprivi Zipfel, formerly part of Bechuanaland protectorate. . . . .	317,725 sq.mi.	Dec. 17, 1920	Union of South Africa	German South-west Africa	German Empire
<i>Togo</i> , comprising: (1) Togoland, i.e. western section, excluding the seaboard. . . . .	13,040 sq.mi.	July 20, 1922	Great Britain	Togo	German Empire
(2) Togo, i.e. eastern section and seaboard . . . . .	20,070 sq.mi.		France		
<i>Cameroons</i> , or Cameroun, comprising: (1) Cameroons adjoining Nigeria . . . . .	34,081 sq.mi.	July 20, 1922	Great Britain	Kamerun	German Empire
(2) Cameroons adjoining French Equatorial Africa . . . . .	166,490 sq.mi.		France		
<i>Tanganyika</i> . . . . .	360,000 sq.mi.	July 20, 1922	Great Britain	German East Africa	German Empire
<i>Ruanda-Urundi</i> . . . . .	20,506 sq.mi.		Belgium		
<i>Palestine</i> . . . . .	10,000 sq.mi.	Sept. 29, 1923	Great Britain	Palestine	Ottoman Empire
<i>Transjordan</i> . . . . .	34,700 sq.mi.			Part of the Wilayat of Syria	
<i>New Guinea, Territory of</i> , comprising: (1) North-eastern New Guinea (i.e. the northern section of south-east New Guinea) . . . . .	93,300 sq.mi.	Dec. 17, 1920	Commonwealth of Australia	Kaiser Wilhelm's Land	German Empire
(2) Bismarck Archipelago (New Britain, New Ireland, the Admiralty Isles, etc.) . . . . .				Bismarck Archipelago	
(3) Certain of the Solomon Islands (Bougainville, Buka, etc.) . . . . .				German Solomon Islands	
<i>Western Samoa</i> , comprising Savaii, Upolu, etc. . . . .	1,130 sq.mi.	Dec. 17, 1920	New Zealand	German Samoan Islands	German Empire
<i>Nauru</i> . . . . .	5,396 ac.	Dec. 17, 1920	British Empire, as represented by Great Britain, Australia, and New Zealand	Nauru	German Empire
<i>Pacific Islands North of the Equator</i> , comprising: (1) Marianne or Ladrone Islands (except Guam) . . . . .	245 sq.mi.	Dec. 17, 1920	Japan	No change	German Empire
(2) Caroline Islands, comprising the Eastern Carolines and Western Carolines, together with Yap Island and Pelew . . . . .	380 sq.mi.				
(3) Marshall Islands. . . . .	160 sq.mi.				

Lord Hailey (British), director of the African research survey, was appointed by the council in Sept. 1936 in the place of Lord Lugard, who had resigned, and in May 1937 Governor Augustin Giraud (French) was appointed in the place of M. Manceron, deceased.

**BIBLIOGRAPHY.** See Report of the secretary-general of the League of Nations; Minutes and reports of and to the Permanent Mandates Commission. (S. A. HE.)

**Manganese.** The salient features of the depression drop and recovery for the various important producers and consumers of manganese are shown in the accompanying table. In production, points of note are the recent exceptionally heavy Russian outputs, the development of South Africa as a producer of major importance, and the failure of Brazil, Egypt and India to come back to their former levels.

On the consumption end, the United States is the only country which has shown a material increase in imports. Belgium, France, and Germany are well below the 1929 level, not because of any lowering of consumption demand, but as a result of a reduction in their former scale of stocking for future emergency need, a practice which had been maintained in these countries for several years. Another point of interest brought out by these figures is the status of the Russian output; the Soviet Union is the only important producer which is also a consumer on any appreciable scale, and since no other important consumer produces any significant amount, this means that, roughly speaking, the difference between the total output and the total consumer imports for any year is an approximate measure of the amount of the Russian output that has been retained within the country. Since 1934 this amount has been far in excess of any possible demand

World Production and Imports of Manganese Ore  
(In thousands of metric tons)

the local steel industry, indicating production that is much greater than the demand, and leading to the assumption that large amounts are being held in stock. This same conclusion is indicated by a comparison of production with exports, which declined heavily in both 1935 and 1936, in the face of large increases in production, leaving surpluses of the same order of magnitude as those indicated above. (G. A. Ro.)

**Manitoba,** mid-continent Province of Canada and the oldest and most easterly prairie Province; area: 251,832 sq. mi. (27,055sq.mi. water); population (census of Manitoba, 1936), 711,216. Capital, Winnipeg, 215,814. Of the Province's population 310,927 are urban, or 44%; British racial origin,

362,389; Ukrainian, 86,982; German, 52,450; French, 47,683; Polish, 35,136; Scandinavian, 21,504; Dutch, 25,521; others, 66,120.

**History.**—Manitoba became the fifth Province of Confederation in 1870, and in 1930 received control of its natural resources and thus equality of Provincial status. The legislature was bicameral until joint action of the appointed and elected chambers in 1876 did away with the former. In 1890 the use of English as the only official language was approved by law, and the public school system was made non-sectarian. In 1900 Manitoba succeeded in securing abolition of the monopoly clause in the C.P.R. charter. In 1916 the legislative assembly led in Canada in enfranchising women. The present legislature consists of 55 members, with the Government headed by Hon. John Bracken, premier since 1922. The lieutenant-governor is Hon. William J. Tupper. Manitoba elects 17 members to the House of Commons of Canada, and has six representatives in the Senate.

**Education.**—Public, elementary and secondary schools are maintained by general taxation, with the Manitoba University, including a faculty of agriculture, and affiliated colleges, providing for higher education. There are also several other colleges and schools.

**Public Welfare.**—A provincial Department of Health and Public Welfare administers the following statutory services: child welfare, hospital aid, marriage, mental diseases, municipal hospitals, public health, venereal diseases, sanatorium, and vital statistics. The Government maintains three public health institutions for mental diseases, juvenile courts, jails, and in addition there are many Government-assisted and private charity and relief services.

**Banking and Finance.**—Winnipeg, the financial centre of Western Canada, is the western headquarters of eight of the 12 Canadian banks, and of insurance, mortgage and financial institutions. For 12 years to 1932, savings offices were maintained by the Government.

**Agriculture, Manufactures, and Mineral Production.**—The gross total value of products of manufacturing industry in 1935 is estimated at approximately \$118,000,000, and the output has been maintained since, with an increasing production of minerals, totalling \$11,500,000 in 1936. Furs, fisheries and forests also yield important returns. The Province has an abundance of low-cost electrical power, developed at several points on the Winnipeg river. The railway mileage is Canadian Pacific Railway, 2,697, and Canadian National, 2,985, the latter including the 510mi. of line from The Pas to Churchill on Hudson bay, whose coast for 400mi. forms part of the northern boundary of Manitoba. There are 4,200mi. of Government-maintained provincial highways. (W. J. HE.)

**Maple Sugar.** Production of maple sugar and maple syrup in the United States in 1937 was 990,000lbs. of sugar and 2,562,000gals. of syrup from 11,739,000 trees tapped. In 1936 the yield was 1,042,000lbs. of sugar and 2,358,000gals. of syrup from 11,861,000 trees tapped; in 1935, 1,704,000lbs. of sugar and 3,377,000gals. of syrup from 12,496,000 trees. One gallon of syrup is equivalent to 8lbs. of sugar. In Canada production entirely in terms of sugar has averaged around 28,000,000lbs. the last three years, with an annual value of about \$3,500,000. Approximately three-fourths of Canadian maple products are from Quebec, about one-fifth from Ontario and the rest from the Maritime provinces. In the United States nearly one-half the "sugar" trees tapped are in Vermont, where 5,384,000 trees yielded 417,000lbs. of sugar and 991,000gals. of syrup in 1937. Other maple sugar States in order of production are New York, 3,051,000 trees; Ohio, 1,180,000 trees; Pennsylvania,

518,000 trees; Michigan, 403,000 trees; New Hampshire, 375,000 trees; Wisconsin, 280,000 trees; Maine, 268,000 trees (farm only); Maryland, 58,000 trees. (S. O. R.)

## Marble and Granite.

Sales of marble as building and monumental stone cover on the average about 60% of the United States output, the other 40% being the scrap material. Sales declined steadily from 600,000 short tons in 1927 to a minimum of 132,000 tons in 1935, and recovered to 166,000 tons in 1936, most of the increase being in building stone. Granite shows a somewhat better record, having declined from 10,827,000 short tons in 1929 to 4,442,000 tons in 1933, with a recovery to 13,878,000 tons in 1936, the output having more than doubled in that year. Crushed and broken stone (concrete aggregate, road metal, railroad ballast and riprap) make up 90–95% of the total tonnage; dimension stone for building and monumental work, curb and paving blocks, are only a small percentage on a tonnage basis, but account for half or more of the total value.

Marble has only a small output in Canada, which declined from 26,100 short tons in 1930 to 10,900 tons in 1933, recovering to 20,500 tons in 1936. Granite production suffered heavily, dropping from 1,851,000 tons in 1930 to 257,000 tons in 1933, and recovering only to 856,000 tons in 1936.

British marble is not of commercial importance, most of the supply being imported. What is often termed marble is merely grey limestone patterned with fossils when polished. The amount of limestone used for building and monuments increased from 198,000 in 1930 to 261,000 tons in 1935 although the value decreased from £327,000 to £225,000. Granite (igneous rock) with an output of 8,454,000 tons valued at £3,078,000 in 1930 reached 9,193,000 tons valued at £3,344,000 in 1935, but some of the increase was due to inclusion of the product of North Ireland.

(G. A. Ro.)

## Marconi, Guglielmo Marconi,

MARCHESE (1874–1937), Italian inventor; born at

Bologna, April 25. Senator Marconi's successful experiments with short-wave wireless transmission at Poldhu during 1923–24 led to the British Government's acceptance of his short-wave beam system for imperial communications. In 1931 and 1934 the marchese achieved successful results with still shorter waves, of less than a metre in length. Marconi joined the Fascist Party in 1923, and became a firm friend of Signor Mussolini, who appointed him a member of the Fascist Grand Council; and in 1930, though senators were not admissible to the honour, he was made a member of the Italian Royal Academy, of which he subsequently became president. Marconi was created a marchese in 1929; and among his other honours were the Order of St. Maurice and St. Lazarus, the Civil Order of Savoy, the Grand Cross of the Order of the Crown of Italy, and an honorary G.C.V.O. In 1934 he was elected rector of St. Andrews university, but had not, at the time of his death, been installed in that office. He died near the Piazza di Spagna, July 20, 1937. For details of his life see *Encyclopædia Britannica*, vol. 14, pp. 869–70.

## Marine Biology.

There is no single medium which acts as a clearing house for the reports of the activities and investigations of more than 240 marine institutions of the world. Probably one of the most interesting developments, however, concerns the continued use of the "bathysphere" in the explorations of the superficial and deeper recesses of the sea. In a comparatively small volume of water about eight miles wide and about half a mile deep, off the Bermuda Islands, scientists have already found representatives of about one-third of all the now known species of sea life. The principle of the "bathysphere" has

been pronounced "the greatest invention since the diving suit."

Interesting also is the exploration of the polar seas by the expeditions of the Russian Government; the establishment of the polar station on the ice-floe; and the building of two new marine biological stations, by U.S.S.R. Academy of Sciences. One of these is located at Murmansk, the other at Dalnye-Zelenets bay east of Kola bay. These two stations are designed to be among the finest of their kind in the world. Likewise the British Government has established a new Bermuda oceanographical station, the central problem being the study of the pulses of the Gulf stream in relation to marine life.

Two Pacific expeditions were completed during 1937. One of these, sponsored by the American Museum of Natural History, spent four months in marine collecting and research off South America. A similar interval was spent by the sixth Hancock Pacific Expedition off the coast of Central America. Rare and unknown specimens have been distributed to various institutions of the United States. A long series of sea explorations known as the Marion and General Greene Expeditions, to Davis strait and Labrador sea, under the direction of the U.S. coast guard, have just been completed.

A most valuable scientific contribution during the year was a volume published by the National Academy of Sciences in Washington, D.C., on the international aspects of oceanography, which gives not only a review of the physical aspects of the sea, but includes a complete catalogue of all marine biological stations, reviews their history, location, organization, scope of program and provision for publication as well as other useful information. A twenty-five-year study on salinity and temperatures of the English channel has been released by the Ministry of Agriculture and Fisheries of Great Britain, while the last report of the Permanent Council for the Exploration of the Sea includes studies in rheotaxis, geotaxis, phototaxis, habitats, and nutrition.

Experimental techniques promise to influence contemporary biological thought profoundly. In experimental embryology it was found that sea-urchin eggs when subjected to high centrifugal force (10,000X in sucrose solution) tend to break into nucleated and non-nucleated halves. The non-nucleated halves when treated with parthenogenic agents undergo cleavage and develop into blastulae.

Progress was also made in ecology on the colour adaptive mechanisms in certain marine fishes. In a series of experiments it was found that fishes with the most perfect adaptive mechanism suffered least from predatory foes when placed upon unfavourable backgrounds. Thus the "protective colouration hypothesis" is an operative mechanism in nature has a champion in fact. Recent research shows that bacteria play an important rôle in the nutrition of marine animals. The bacteria utilize the dissolved organic matter of the sea-water and then are ingested by other organisms.

(F. M. B.)

## Marine Corps,

an integral part of the U.S. Navy, is organized and trained on military lines to fit it especially for duty in the naval service both at sea and ashore. The corps dates from Nov. 10, 1775, when it was authorized by the Continental Congress, and in Dec. 1937, consisted of 1,185 commissioned officers, 147 warrant officers, 17,000 enlisted men.

The ranks of officers correspond to those of the Navy, but the titles are those of the Army, from second lieutenant to major general. Marines, 255 officers and 5,950 enlisted men, garrison 34 shore stations, 24 within continental limits and 10 overseas and 109 officers and 2,500 enlisted serve as part of the crews of 48 sea-going battleships and cruisers of the Navy. The fleet marine force is organized, equipped and trained for service with the sea-going fleet, acting as a landing force to seize, defend

and maintain temporary bases that the fleet will require in overseas operations. This force accompanies the fleet on manoeuvres assimilating war conditions. The two brigades of the fleet marine force consist of infantry, artillery, aviation, anti-aircraft batteries, chemical companies, engineer companies and tank companies; total peace strength 300 officers and 4,000 enlisted. Boats designed for landing the fleet marine force on hostile shores are provided.

During the year 1937 an important mission of the Marine Corps has been the protection of American lives, interests and property in China during the Japanese attacks upon China. The U.S. Embassy guard, at Peiping, 20 officers and 500 enlisted, has been maintained in accord with treaty stipulations since the Boxer Rebellion of 1900. In addition to the Embassy guard, a marine brigade, 130 officers and 2,600 enlisted men, has been on temporary duty at Shanghai.

The 14 aircraft squadrons of the Marine Corps, 120 officers and 1,100 enlisted men, form part of the fleet marine force. They are based on marine barracks, Quantico, Va., naval air station, San Diego, Calif., and St. Thomas, Virgin Islands, and move with the fleet base force as required by the needs of the U.S. fleet. Officers and enlisted marines are given specialist courses at six marine schools, and 48 army and navy schools. Officers are commissioned from graduates of the Naval academy and distinguished military colleges and from qualified enlisted men.

The U.S. Marine Corps is in fact a small, compact, highly mobile, self-contained military force of all arms especially adapted for service in the Navy, both at sea and on shore in support of the active operations of the U.S. Fleet. (D. Wt.)

**Marine Insurance.** In this review marine insurance is confined to insurance on hulls and cargoes which is the portion of the business generally considered as marine insurance elsewhere in the world, but which is only a part of the wide variety of classifications included in 33 of the 48 American states. Hull business will show a loss in 1937. The results were bad at the beginning of December, and then came the total loss of the "President Hoover" on which about \$3,000,000 was placed locally. Earlier in the year the sister ship, the "President Coolidge," was in collision with the tanker, "Frank H. Buck," resulting in a total loss of the latter vessel. Another total loss was the "Cauto" in November. Many other losses during the year brought the total to more than the income received. While the cargo business may not have been as bad as the hull business, it was not good. The year began with the West coast strike in full blast; this later spread to the Atlantic and Gulf coasts. All ships, both foreign and coastwise, on the West coast were tied up for weeks and in the East the coastwise and inter-coastal ships suffered badly. Shipping suffered more from strikes in 1937 than in any other year in U.S. history.

In addition the following are some of the disasters which caused heavy losses in 1937: from burning: the "Sandgate Castle," the "Silvercypress," the "Silverlarch," and the "Fijian" from an explosion destroying ship and cargo; from sinking: the "Quarrington Court"; from stranding: the "Johanna Thorden," the "Tristo," and the "Nashaba"; from collision: the "Elstree Range" and "Southern Prince," the cargoes being badly damaged, the "Edward Luckenbach" and the "Feltre," the latter a total loss. The foregoing are only a few of the many casualties which made up a disastrous total for underwriters in 1937.

(S. D. McC.)

**Great Britain.**—In the marine insurance market by far the most important event of 1937 was the agreement made by the marine insurance companies and Lloyd's underwriters in Decem-

ber, confining the cover of the marine war risk policy on cargo to the period during which the merchandise is actually in the vessel in which it is carried overseas, the customary period of cover on shore prior to loading and after discharge being eliminated.

During 1936 Lord Merrivale, Mr. Justice MacKinnon, and Mr. Justice Branson had each uttered criticisms of the system which permitted ships to be insured for amounts far in excess of their actual values.

A Board of Trade Committee appointed to inquire into the system of valuing ships for insurance in the light of these judicial criticisms issued a report early in 1937, but the report stated that the matter was one not of public urgency and that the judicial strictures were directed mainly against theoretical possibilities. Moreover by the time the report was issued, the circumstances which had provoked judicial criticism had disappeared. The value of tonnage had increased with improving trade to such an extent that many ships were under-insured. (D. K.-P.)

**Market Gardening.** In both the United States and Great Britain 1937 saw a further trend, induced by recent droughts, toward achieving greater independence of weather conditions in market gardening. In the United Kingdom there was a continuation of the recent development to divide the vegetable-growing industry into two specialized groups, one growing the commoner types of vegetables in open fields and the other raising the salads, sea kales and other crops under glass. In the United States, owing to repeated droughts in humid as well as the semi-arid areas since 1930, there was an increase in irrigation among gardeners in humid regions where usually normal rainfall has been generally sufficient. The number of acres irrigated in 17 humid north central and eastern states was 11,396 in 1931 and 32,960ac. in 1936, according to estimates by the American Society of Agricultural Engineers while the U.S. Bureau of Agricultural Engineers reported 63,000ac. of irrigated land in Florida.

A severe drought early in 1937 reduced the vegetable acreage and halted the expansion of vegetable gardening that has been in progress in England in recent years. This set-back is believed only temporary as there was an increased use in 1937 of glass frames and greenhouses in producing early salads, radishes, carrots and cauliflower and there was practical progress in methods of converting waste vegetable matter into humus for fertilizer, since chemical fertilizers are alone insufficient. There is an absence of animal fertilizer because many gardens do not use horses in cultivation. Composting is now an established practice.

While the great bulk of vegetable crops grown in the United States is produced in open fields (*see TRUCK FARMING*) there is a large industry specializing in winter crops raised under glass, especially tomatoes, cucumbers and lettuce, and in growing early seedlings for transplanting. The industry is so large it has a nation-wide trade organization, the National Association of Hot House Vegetable Growers.

Market garden experiments in the use of electricity reported activities in three different directions in 1937 in the United States. I. C. Hoffman of the Ohio station reported at the annual convention of the Vegetable Growers' Association of America, December 13-16 in New York city, that electric lighting materially increased the earliness of a spring crop of tomatoes. Reports on experiments in using electricity for bottom heat in cold frames and hot houses were not conclusive. Some growers reported that the cost of electric current was too high to make this form of heating profitable, while others reported practical results. The committee on the Relation of Electricity to Agriculture issued a report in July on the adaptability of electric power to irriga-

tion in U.S. humid regions and methods of irrigation suitable under different conditions. Methods in common use include spray irrigation systems, with either revolving sprinklers, or low-pressure perforated pipe, or overhead sprinkler systems, or eyelet hose; surface irrigation systems, either furrow or flood; porous hose; subsurface irrigation systems, either ditch or pipe.

Hot house production of vegetables has resulted in a number of improved types of vegetables. The Cheshunt Research station, England, has introduced two new varieties of lettuce for production under glass and the Seale Hayne college has introduced stocks of winter broccoli for Devon and Cornwall, the latter of which produced approximately 40,000 tons of broccoli in 1937.

## Marketing.

The wholesaler-retailer system continues as the channel through which nearly three-fourths of all consumer goods reach the public. The belief frequently expressed by many business writers in the 1920's that the wholesaler-retailer system might be displaced has not materialized, nor is there any likelihood that it may do so.

The direct distribution systems including the department stores, mail order houses and chain stores have similarly held their own not only in volume of sales but in the service rendered to the consuming public through competition in regulating prices and conditions of purchases.

Consumers' co-operatives, an important factor in the distribution of goods in several European countries, are still insignificant in the United States in volume of business transacted, although public interest in this form of distributive ownership and control seems to be growing. House-to-house selling as a channel of marketing has always been and is still important in the sale of many commodities of common use, such as fresh fruits and vegetables, milk and other food products. The extent of house-to-house distribution in other lines of goods varies with business conditions. The numbers engaged in house-to-house selling tend to increase as general business conditions decline, and, tend to fall when business conditions improve.

The use of advertising and other aids to marketing continues at intensified rates. Perhaps the most outstanding changes in recent advertising have been to use more and better illustrations, more complete descriptions and better copy writing. The recent extensions of the use of radio for advertising purposes particularly in America is especially noteworthy. Under the rising competition of radio, advertising by newspapers, periodicals and other advertising media have been hard pressed to maintain their former positions.

The even balance of the various marketing systems competing for consumers' trade is being threatened by new competitive devices recently introduced by factors from the wholesaler-retailer system. It has been discovered that the numbers of small concerns engaged in wholesaling and particularly in retailing dependent upon wholesalers for their sources of supplies have, when organized and directed, a political potential useful in setting up disadvantages for their competitors and in securing special privileges for themselves. The movement is still new, but if it succeeds it may restrict or destroy the further normal development of direct distribution through department stores, mail order houses, and, particularly chain stores.

Similar attempts to curb direct distribution have taken place in several European countries usually in the form of prohibitions upon further growth or expansion. In the United States such attacks made commonly take the form of discriminatory regulation and taxation through State and municipal legislation. Since the beginnings of such attempts made back in the middle 1920's, there has been a rush towards these methods. In the period from 1925 down through 1937, more than 900 bills including such pro-

posals were introduced, of which 50 have been enacted in 27 different States.

The discriminatory tax proposals enacted against direct distributors have taken several forms, such as licence taxes graduated in amount according to the number of stores or units operated, gross sales taxes, graduated in amount according to the volume of total sales, and sales area taxes graduated in amount according to the floor space area of the store or stores owned. Clearly, such taxes may be highly effective in crushing competitors. The department stores, mail order houses, and chain stores obviously depend for their economical operation upon the volume of their sales. By starting such taxes at nominal rates for small concerns that make their purchases through wholesalers, and then increasing them abruptly for concerns who make their purchases directly from producers, such taxes may, in fact, not merely restrict but actually destroy.

In the legal tests made against these types of discriminatory taxation, the courts have upheld the graduated licence tax, but have rejected the graduated gross sales tax. Licence taxes graduated in amounts depending upon the number of stores operated are now in force in 22 states. Some of these tax provisions are mild in effect, others are sufficiently heavy to be confiscatory.

In addition to the discriminatory tax schemes referred to above representatives of the wholesaler-retailer system, with the cooperation of politicians, have to date secured the passage of price maintenance laws in 42 states and of still other laws regulating or prohibiting sales below costs, including expenses of distribution, in 23 states. These two types of legislation are publicly termed "fair trade laws" and "unfair practice acts." There has likewise been an effort to prohibit differentials in purchasing prices and other considerations ordinarily based on difference in quantities bought, in what is known as the Robinson-Patman Federal Act of 1936.

These measures whose purpose it is to restrict and hamper direct distribution are certain to have other effects besides those sought by their promoters. With the competition of direct distribution restricted, there will be less reason for intense effort now being made to render efficient service and keep prices down. Increases in prices may prove to be a vital matter to ultimate consumers. Thus, this movement organized and promoted to serve one system of distribution as against its competitors may prove contrary to the public interest. Whatever the legislature may direct and the courts decide as to the permissibility of such competitive manoeuvres, it seems likely that the matter will probably have to be settled in the final courts of public interest. These issues growing out of this new method of competition of the major marketing systems are almost certain before long to become major political questions. Consumers will have to decide by ballot as well as by patronage on what marketing institution and what channels of trade they may want preserved for their service. (See also MAIL ORDER BUSINESS; RETAIL SALES.)

(P. H. N.)

## Marketing Boards.

Agricultural marketing boards in Great Britain are bodies set up by producers of agricultural products with the object of securing the advantages of large-scale organization. They derive their status in law and their functions from schemes framed and submitted under the Agricultural Marketing Acts, 1931 to 1933. The initiative in the submission of schemes must come from persons substantially representative of the producers of the product concerned. Every scheme requires the approval of the appropriate Minister, who must give opportunity for objections and may modify the scheme, and also of Parliament. When thus approved, a scheme comes fully into force only if, in the suit-

sequent poll, votes representing two-thirds of the producers and two-thirds of the quantity of the product are given in favour of it.

Public safeguards are provided in the form of (1) Consumers' Committees, whose duty it is to consider and report to the minister on the effect of schemes on consumers and on any complaint as to the effect of schemes on consumers; (2) Committees of Investigation, whose duty it is to consider and report on matters referred to them by the minister; these may be reports by Consumers' Committees or complaints made to the minister by persons other than consumers. After an adverse report by a Committee of Investigation, the minister may revoke a scheme, amend it, or require the board to rectify the matter in complaint. In the case of revocation, the minister's order must be approved by each House of Parliament; in the other two cases, the order must be laid before each house and may be annulled by either.

A further public safeguard lies in the power of the minister, on his own initiative, if he is satisfied that any provision of a scheme or any act or omission of a board is contrary to the interest of consumers of the regulated product or is contrary to the interest of a substantial number of persons affected by the scheme and is not in the public interest, to make an order revoking the scheme, subject to the approval of each House of Parliament.

Within this general framework, schemes differ according to the selection made by the promoters from the variety of powers with which, under the acts, a board may be endowed. The selection is naturally governed by the circumstances obtaining in the case of each product. A board may, for instance, be solely a trading body, or it may exercise only regulatory functions; or, again, it may be a combination of the two types. All-embracing, producer-controlled organizations of this kind, authorized under statute to regulate the marketing activities of their constituents, are new to British agriculture. They may be said to carry to a logical conclusion the voluntary movement for the co-operative marketing and standardization of agricultural products which has gone far in other countries, and, for some commodities, has made steady progress in England. They reflect the tendency towards regulation in economic affairs. It may be noted that under the Agricultural Marketing Act, 1933, imports may be regulated in conjunction with a marketing scheme.

Eight schemes are in operation in Great Britain. The hops scheme is an example of the trading type. All hops are sold through the Hops Board, and the proceeds are pooled and divided among growers according to quotas allotted to them on the basis of past performance. The stability which the scheme has introduced has been assisted by a five-year price and supply agreement between the board and the brewers.

The potato scheme, on the other hand, is regulatory in character. Its purpose is to stabilize prices. In order to assist the adjustment of supply to demand, each producer is allotted a basic acreage, and is liable for a non-recurring payment of £5 per acre if he grows potatoes in excess of that acreage. In addition, the board determines, from time to time, the minimum size of potatoes that may be sold. The board has paid special attention to the development of an effective market intelligence service.

The pigs marketing scheme and the bacon marketing scheme, together with a bacon development scheme under the act of 1933, are part of one and the same plan, the main purpose of which is to adjust an expanding home production to the requirements of a market which is quantitatively regulated under the act of 1933. The schemes recognize that a market for a manufactured product such as bacon cannot be built up on fluctuating supplies of raw material. The schemes therefore encourage the sale of pigs to bacon curers on annual contracts at prices so varied as to induce the production of the qualities required in level quantities through-

out the year. Since the schemes have been in operation, the output of home-produced bacon has doubled. Owing to the sudden increase in the cost of animal feeding-stuffs, no contracts were operative in 1937.

The milk scheme of England and Wales, with its 150,000 registered producers and its annual turnover of over £40,000,000, on wholesale account, is the giant among the marketing schemes. The pivotal function of the board is the prescription of the terms on which milk may be sold. It is a party to all wholesale contracts, and the money received for milk sold under such contracts is payable to the board by the buyers. The central feature of the scheme is the payment of these moneys into regional pools, adjustments being made between pools to even up returns.

The annual value of the products covered by marketing schemes is in the neighbourhood of £100,000,000, or over one-third of the total annual value of home agricultural produce. No scheme is yet six years old, and marketing schemes are still, to some extent, to be regarded as experimental; but whatever changes lie in the future, the principle of all-inclusive organization is likely to endure.

**Marquis, Donald Robert Perry** (1878-1937), American humorist, poet and playwright, was most widely known as creator of archy, the cockroach, and mehitabel, the cat. These famous companions of the lower case inaugurated as fillers for a daily column surpassed even the successful play, *The Old Soak*, in popular favour. Marquis' best known poems and plays are listed in the *Encyclopædia Britannica*, vol. 14, p. 939. Unfortunately his work came to an abrupt halt in 1932 when a brain haemorrhage left him totally blind for a time. Another attack in February, 1936, rendered him a helpless invalid, although he did not succumb until Dec. 29, 1937 at his home in Forest Hills, N.Y.

**Marriner, James Theodore** (1892-1937), American diplomat, was born in Portland, Me., March 27, 1892. Having received a Ph.D. degree from Harvard four years after graduation from Dartmouth in 1914, he entered the diplomatic field by assuming minor posts in the Swedish and Rumanian legations. After three years of service with the Western European Division of the Department of State (1923-1926), he became secretary of the Swiss legation and served as a United States member at several disarmament conferences. He returned to Washington in 1927 as chief of the Division of Western European Affairs, but left this post in 1931 to become counsellor of the Paris embassy. It was while serving in his most recent post of consul-general at Beirut, Syria, that he was assassinated on Oct. 12, 1937 by a crazed Armenian.

**Martinique**, French West Indian colony; language, French; capital, Fort-de-France; Governor, I. B. Alberti. The area is 380 sq.mi.; the population by the 1936 census was 234,505. The chief cities are: Fort-de-France, the capital (pop. 48,395); Le Lamentin (pop. 16,303). Martinique is administered by an appointed governor and an elected council and has representation in the French Parliament. During 1937, French laws of 1936 concerning agricultural moratoriums and arbitration of labour disputes were extended to Martinique by decree. Fort-de-France has direct steamship connections with France and with other parts of the West Indies, and air connections with New York. Martinique has 600km. of automobile highways, with 200km. of exclusively freight railroads. Imports and exports (1936) aggregated in value 155,632,000 francs and 191,143,000 francs against 140,041,000 and 165,590,000 francs in 1935. The chief exports are sugar, rum, and bananas, practically entirely to

France. Foodstuffs, tobacco, lumber, and textiles, are imported, with 66% supplied by France. Approximately 45,000 ac. of sugar cane is cultivated. Refining is done by 19 sugar-mills, capitalized at 50,000,000 francs. There are two rum distilleries. The monetary unit is the French franc (value: 3.46 U.S.). Martinique has 118 primary schools, and several secondary and technical schools, with 12,000 students. Fort-de-France is the French West Indian naval base and military headquarters.

**Maryland**, usually called the "Old Line State" and more recently the "Maryland Free State," lies on the Atlantic seaboard between Pennsylvania on the north and Virginia on the south. The total area is 12,300.21 sq.mi. of which 2,429.89 are water, mostly the Chesapeake bay and its tributaries. Population (U.S. census 1930) 1,631,526; (estimate July 1, 1937) 1,679,000. Under the 1930 figures, the population was subdivided between 1,259,077 native born whites, 276,379 negroes and 95,093 foreign born. Of these 974,869 were urban and 656,657 rural. Annapolis, with a population of 12,531 is the capital. Other large cities and their population (1930) were Baltimore (862,059), Cumberland (37,747), Hagerstown (30,861), Frederick (14,434) and Salisbury (10,997). The birth rate for 1937 (9 months) was 15.8; white 14.9; negro 20.4. The death rate for 1937 (9 months) was 12.7; white 11.9; negro 16.7. Infant mortality: 1937 (9 months) 63.1; white 52.6; negro 100.1.

HARRY W. NICE, governor of Maryland

**History.**—State officials: governor, Harry Whinna Nice (Rep.); comptroller, William S. Gordy, Jr. (Dem.); attorney-general, Herbert R. O'Connor (Dem.). All terms expire Jan. 1939. The State budget for the fiscal year Sept. 30, 1937 to Sept. 30, 1938 was \$35,359,802 plus \$2,666,013 from Federal sources and \$2,300,000 from bond issues. The funded debt as of Jan. 20, 1938 was \$46,512,000.

The legislative session of 1938 passed Maryland's first income tax law ( $\frac{1}{2}$  of 1% on all incomes with the same exemptions, generally, as provided by Federal law); strengthened and enriched the University of Maryland; added to the powers and area of the Washington Metropolitan District Commission in order to provide for growth of Washington suburbs; provided for State use of prison-made goods; incorporated the town of Greenbelt, Prince George's county, a \$15,000,000 Federal Housing project; authorized the creation of housing authorities with condemnation powers by incorporated cities; and provided for a new State office building at Annapolis. The year saw, also, the completion as far as Havre de Grace of the new dual highway between Baltimore and Philadelphia and some progress on a similar modern road from Baltimore to Annapolis.

The State Planning Commission published its report on the future development and use of the varied area in the Baltimore, Washington, Annapolis triangle. President Roosevelt opposed a scheme to bridge the Chesapeake bay from a point just east of Baltimore to the eastern shore, but other similar schemes were still being discussed. Widening to 250 ft. and deepening to 27 ft. the canal connecting the Chesapeake and Delaware bays was approximately completed (Jan. 1938). Deaths by automo-

biles on Maryland roads totalled 590 in 1937 as opposed to 490 in 1936. Public elementary and high school enrolment was (1936-37) 348,386 of which 58,376 were negroes.

**Banking and Finance.**—Banks and trust companies in the State (124) showed total resources (June 30, 1937) of \$330,311,460.74 as compared with \$314,821,070.49 in 1936. Total deposits on June 30, 1937 were \$279,653,743.22, as compared with \$265,633,357.08 on June 30, 1936. Mutual savings institutions reported deposits of \$221,187,472.64 on the same date. There were no bank failures in 1937. Of \$50,320,000 impounded in the crash of 1933, \$22,794,220 had been paid to depositors as of June 30, 1937.

**Agriculture, Manufactures, Mineral Production.**—The total acreage, all crops, in 1936 was 1,697,610, with an estimated value of \$55,465,000. Livestock and dairy products bring in annually about \$60,000,000. Oyster production, 1936-37 was 3,081,068 bushels; crabs: hard (1936) 144,491 bbl.; soft 10,493,615.

Maryland's coal mines produced 1,708,231 net tons in 1936 and 1,281,000 net tons in 1937 (Jan.-Oct., inc.). Other minerals: lime and lime-stone, \$600,000; slate, \$200,000; miscellaneous stone, \$118,000; granite, \$125,000; basalt, \$265,000; asbestos, cement, raw clay, talc, feldspar, etc., \$1,500,000 (all figures 1935). The total value of manufactured products in 1935 was \$757,852,170 in 2,697 plants. (H. Ow.)

**Masaryk, Thomas Garrigue** (1850-1937), founder and first president of Czechoslovakia as well as a philosopher and sociologist, was born in the Moravian border-town of Hodonin, March 7, 1850. Son of a coachman, he studied philosophy at the Universities of Vienna and Leipzig and at the latter met his future wife, an American. For several years his time was devoted to producing philosophical treatises, but he was elected to the Austrian *Reichsrat* in 1891 and became a nationalist leader. The World War provided an opportunity to publicize the cause of the Czechs on an international scale. This work was climaxed in 1918 when Czechoslovakia was declared an independent nation. Local recognition of his services came with successive elections as president until his resignation in Dec. 1935. Despite many political disagreements among the Czechs, he remained a subject of national reverence until his death at Prague, Sept. 14, 1937. A more complete discussion of his life may be found in the *Encyclopædia Britannica*.

**Masonry:** see FREEMASONRY.

**Masood, Sir Syed Ross** (1889-1937), Indian Moslem educationist; born February 18, 1889. He was educated at the Aligarh university (then the Mohammedan Anglo-Oriental college) and New college, Oxford, and was called to the Bar by the Middle Temple. After being headmaster of the Patna Collegiate school, and professor of history at the Ravenshaw college, Cuttack, he was, from 1916 to 1928, director of public instruction in Hyderabad. For his services in this capacity the Nizam conferred upon him the title of Nawab Masood Jung Bahadur. In 1929 he became vice-chancellor of the Aligarh university. He was knighted in 1933, and from 1933 till his death was Minister of Education on the Executive Council of Bhopal. His chief publications were *Japan and its Educational System* and (in Urdu) *Intikhab-i-Zarrin*. He died at Bhopal, July 30, 1937.

**Massachusetts**, one of the thirteen original States of the United States, popularly known as the "Bay State"; area, 8,266 sq.mi.; population according to U.S.

census of 1930, 4,249,614, estimated by U.S. Census Bureau, July 1, 1937, 4,426,000, estimated Jan. 1, 1938, 4,435,000; capital, Boston, population (1930) 781,188, estimated Jan. 1, 1938, 810,000. Of the State's population (1930) 1,931,418 or 45% live in the cities; 4,192,926 whites, 52,365 coloured; native born, 3,194,978; foreign-born, 1,054,636.

**History.**—For the third successive biennium the government of Massachusetts is entrusted to an executive department predominantly Democratic and a legislative department decisively Republican. Inaugurated on Jan. 6, 1937, for a two-year term were the following elective officers of the commonwealth: governor, Charles F. Hurley, D.; lieutenant governor, Francis E. Kelly, D.; secretary, Frederic W. Cook, R.; treasurer, William E. Hurley, R.; attorney-general, Paul A. Dever, D.; auditor, Thomas H. Buckley, D. The legislature, also elected for two years, consists of a Senate of 40 members, 27 Republicans and 13 Democrats, and a House of 240 members, 136 Republicans and 104 Democrats.

The legislative session, which began Jan. 6, continued without interruption until adjournment on May 29. During that time more than 2,500 petitions were considered. Several important bills were enacted into law. In one instance, it was voted to submit to popular referendum the question of biennial instead of annual sessions of the legislature. Thus will be settled in Nov. 1938, a question which long has agitated the commonwealth. If the people give their approval, sessions will be held every second year.

By another act, there was established for the State a pension system for judges. In the seven months of 1937 that this plan was operative, thirty-five justices took advantage of its provisions. The legislature also ratified inter-State flood compacts for the Merrimac and Connecticut valleys, created a commission to study communist, Fascist, and Nazi activities within the State, voted to permit absentee voting in town elections and abolished the law providing for pre-primary conventions of the major political parties. A move to abolish capital punishment was defeated, as were bills to legalize a State lottery, to tax chain stores, to impose a 2% sales tax, to ratify the national child labour amendment, and to bar married women from civil service positions.

The year witnessed a notable development of co-operative relations between Massachusetts and the other New England States. In consequence, joint action was inaugurated to promote the section's recreational activities, to find ways and means of combating disastrous floods along its two great rivers and to make easier the pursuit, capture and punishment of criminals.

In common with other States, Massachusetts continued to suffer from the effects of the depression. Although its great shoe and textile industries enjoyed reasonable prosperity in the spring and summer, they fell victims to the fall recession. As a result, the number of unemployed and partly employed was increased.

There was no State-wide election in Massachusetts during 1937, but mayors were chosen by a score of cities, and selectmen by hundreds of towns. Among the municipal elections, chief interest centred in the result in Boston where Maurice J. Tobin was the victor in a four-cornered contest for the mayoralty term of four years. Mr. Tobin was by far the youngest of all the candidates. He had been a member of the State Legislature and chairman of the Boston school committee. He is a Democrat.

**Education.**—According to the latest available statistics (the report of the commissioner of Education, for the year ending Nov. 30, 1936) the public day schools of Massachusetts have an enrolment of 758,351, with an average daily attendance of 673,277. In addition, there were 29,770 pupils in the public evening schools and 1,304 in the public vacation schools. The total amount of money appropriated for the support of the public

CHARLES FRANCIS HURLEY, governor of Massachusetts conversing with Mrs. Franklin Delano Roosevelt

schools was \$69,145,205, of which \$49,389,421 was devoted to the salaries of supervisors, principals and teachers and the sum of \$899,638 to textbooks.

Under the law education is free. It is compulsory for all between the ages of 7 to 14 years and required up to 16 years unless the sixth-grade work has been completed. Massachusetts maintains a State college at Amherst, a State nautical school, a school of art in Boston, three textile schools and teachers' colleges at Bridgewater, Fitchburg, Framingham, Hyannis, Lowell, North Adams, Salem, Westfield and Worcester. In addition it supports a division of university extension, and a division of vocational education. It also awards State scholarships to deserving students in several private colleges and universities. In the year ending Nov. 30, 1936, the State teachers' colleges had an enrolment of 2,544 women and 436 men. The number of people registered for university extension courses was 30,157.

**Charities and Correction.**—Supervision of the State institutions is divided among several departments. The commission of Correction has charge of the State prison at Charlestown, the Massachusetts Reformatory at Concord, the Reformatory for Women at Framingham, the State farm at Bridgewater and the Norfolk Prison Colony at Norfolk. Under the jurisdiction of the Department of Mental Diseases are State hospitals at Boston, Worcester, Taunton, Northampton, Danvers, Westborough, Medfield, Monson, Gardner, Waltham, Wrentham, Foxborough, Grafton, and Norfolk, as well as the Boston Psychopathic Hospital, the Belchertown State school, and the Hospital Cottages for Children at Baldwinville. The Department of Public Health supervises sanatoriums at Rutland, North Reading, Lakeville and Westfield and the Hospital for Cancer Patients at Pondville. The State infirmary at Tewksbury is the special charge of the Department of Public Welfare.

**Banking and Finance.**—The State commissioner of Banks has under his supervision a total of 828 institutions, including 193 savings banks, 74 trust companies, 213 co-operative banks, 334 credit unions and a few private banks. By the latest annual report of the commissioner (Jan. 1937) these institutions are shown to have assets of \$4,554,809,288. According to the report of the commissioner of Administration and Finance, the State's net direct debt at the end of 1937 stood at \$26,639,085. This represents a reduction of \$4,481,516 during the year. The leading sources of revenue for the fiscal year ending 1936 were motor vehicle and gasoline taxes (\$25,496,875), Federal grants (\$12,489,506), corporation taxes (\$12,031,426), assessments on cities and towns (\$10,000,012). Total receipts for the year were \$93,820,297; total expenditures, \$93,384,601.

**Agriculture, Manufactures, Mineral Production.**—Although primarily industrial in character, the Massachusetts economy in-

cludes a considerable agricultural production. Thus during the year 1936, according to the statistics of the United States Department of Agriculture, the State raised; 6,385,000lbs. of tobacco, 360,000bbls. of cranberries, 378,000bu. of grain corn, 254,000 short tons of silage corn; 1,716,000bu. of apples, 464,000 tons of hay, and 170,000bu. of oats. Its production of milk totalled 755,000,000lbs. and on its farms were 189,000 cows and calves, 95,000 hogs and 8,000 sheep which gave 42,000lbs. of wool.

With respect to manufactured goods, statistics for 1935 show the value of the State's leading products as follows: boots and shoes, rubber, \$21,574,887; boots and shoes, other than rubber, \$132,187,681; cordage and twine, \$14,514,163; cotton goods, \$109,508,920; electrical apparatus and supplies, \$83,188,097; furniture, \$19,250,801; jewellery, \$10,477,437; knit goods, \$26,661,041; leather, \$56,802,448; machinery, \$34,938,078; paper, \$52,683,867; rayon, \$30,551,562; wire, \$17,109,022; total, \$2,095,389,595. The number of industrial plants in the State at the end of 1937 was estimated at 8,500.

Fishing is still one of the State's great industries. In 1936 about 330,000,000lbs. of fish, valued at \$9,000,000 entered the ports of Boston and Gloucester and were distributed therefrom.

The chief mineral products and their 1935 values were: coke, \$6,048,544; clay, \$883,797; lime, \$642,755; sand and gravel, \$831,103; and stone, \$3,204,858.

(H. T. C.)

## Massachusetts Institute of Technology.

In 1937, for the first time since early in the depression period, attention at the Massachusetts Institute of Technology was turned from an almost exclusive consideration of problems of internal co-operation and efficiency toward an extensive program of objectives.

Of major importance were plans for expanding the physical plant. These were inaugurated with the sale of the original Boston site, and the decision to erect a large wing to the main institute group. At the same time ground was broken for a new air-tight steel shell to house the 10,000,000 volt electrostatic generator, important for nuclear research. Also started was a wind tunnel of unique design, capable of developing wind velocities of 400m.p.h. and simulating atmospheric conditions at altitudes of 35,000ft. and a propeller testing tank. A final important addition to plant resulted from the purchase of a neighbouring apartment hotel, admirably suited for conversion into a spacious graduate house.

Of possible far-reaching significance was the recognition of a new practical approach to biological and medical problems, involving the co-operative effort of biologists, chemists, physicists, and engineers, by the inauguration of a program designated as biological engineering. A feature of this program which aroused wide interest, was the successful design and construction for a Boston hospital of the world's most powerful electrostatic X-ray generator.

Particularly important to industry was the creation, as a public service, of an industrial relations section, the objectives of which are the collection, classification, dissemination, and interpretation of facts of experience in the field of employer-employee relations.

(K. T. C.)

**Mathematics.** In surveying the development of mathematics during a short period of one year it is usually easier to point out general trends rather than to pick out separate facts. The year 1937, presented an exception since a decisive step was made toward a solution of one of the most famous and difficult problems of Number Theory, known as the Goldbach Problem. In a letter written to Euler in 1742 Goldbach conjectured that every even number can be represented as a sum of two

primes. The problem remained intractable until 1923 when the Englishmen Hardy and Littlewood, assuming the validity of an unproved conjecture of Riemann, proved that every sufficiently large odd number can be represented as a sum of three odd primes. In 1930 the Russian Schnierelmann proved directly that every integer number can be represented as a sum of no more than 800,000 primes.

This result was characterized by Landau as one of the greatest successes in Number Theory. The number 800,000 was lowered to 2,208 by the Russian Romanoff in 1935, to 71 by the German Heilbronn, Landau and Scherk in 1936, and to 67 by the Italian Ricci in 1937. Returning to the analytic method of Hardy and Littlewood and combining it with a powerful new method of his own Vinogradov, a Russian, proved the above theorem of Hardy and Littlewood, without any further assumptions. The exposition of Vinogradov's method together with applications to other important problems of Number Theory was published in a significant paper in the *Travaux de l'Institut Mathématique Stekloff* of the Russian Academy of Sciences, vol. X, 1937. Vinogradov's work represented a triumph of analytic Number Theory, even more significant than the classical work of Hadamard, Vallée Poussin and Mangoldt concerning the distribution of primes.

Another important progress in additive number theory was due to Rademacher, an American, who gave an expression, in form of a convergent series, for the number of partitions  $p(n)$  of an integer  $n$  into a sum of integers, the two partitions being considered as the same, if they differ only by the order of terms (*Proc. London Math. Soc.*, Ser. 2, 43, pp.241-254).

A notable trend in the recent development of mathematics consisted in a fusion of fields which heretofore appeared as widely separated. Thus the methods of abstract algebra seem to acquire more and more importance in investigations not only in algebra proper, but also in analysis and geometry. The situation is illustrated best of all by the creation of a new system of geometry, which von Neumann, an American, calls continuous geometry. In this geometry the basic elements are not points of the classical geometry, but linear sets.

To each linear set  $L$  of von Neumann's geometry there corresponds a numerical function  $D(L)$  called dimension of the set  $L$ , which coincides with the usual dimension of  $L$  in the case of classical geometry. But in the general continuous geometry  $D(L)$  can assume all values, not necessarily integral, between 0 and a certain constant  $c > 0$ . A series of lectures on this subject was delivered at Pennsylvania State college, Sept. 7-10, and will be published in the *Colloquium Publications* of the American Mathematical Society.

The Theory of Probabilities is a branch of mathematics which has developed particularly rapidly during the recent years. Accounts of this development are given in two books, by Cramér, *Random Variables* and *Probability Distribution*, Cambridge Eng., and by P. Lévy, *Théorie de l'Addition des Variables Aléatoires*, Paris.

Mathematicians are beginning to realize more and more the importance of co-operation and mutual help in their work as is shown by the number of international and national conferences in recent years. Such were the conference on Tensor Differential Geometry (Moscow univ., May 17-23, 1934) of which the report appeared in 1937, the conference on Topology (Moscow univ. Sept. 4-10, 1935), and the conference on the Theory of Probabilities (Univ. of Geneva, Oct. 11-16, 1937). A symposium on the Calculus of Variations (Notre Dame univ., April 7-8) should also be mentioned.

Among popular works appearing in 1937 should be mentioned the excellent essay, *Men of Mathematics*, by Professor E. T. Bell of the California Institute of Technology.

(J. D. T.)

**Matrimonial Causes Act:** see DIVORCE: *Great Britain.*

**Matter, Structure of.** Fundamental for modern views on the structure of matter are the discoveries of the structural units of the atom, the electron, and the atomic nucleus. As is explained in greater detail in the article "Atom" in the *Encyclopædia Britannica*, vol. 2, p. 642, the nuclear model of the atom due to Lord Rutherford allows above all a simple discrimination between such properties of matter, including all ordinary physical and chemical effects, which depend primarily upon the extra-nuclear electron configuration of the atom and those which essentially involve changes of the atomic nuclei themselves, as manifested in the phenomena of natural radioactivity or of artificial nuclear transmutations initiated by impact of material particles or by radiation, the continued study of which has given such remarkable results in the past few years.

As regards the account of the former properties of matter on the basis of the nuclear atom, the incorporation of the quantum of action discovered by Planck into the mechanical treatment of the electron configuration has offered a decisive clue to the understanding of the intrinsic stability of those configurations. In particular, it has led, through the study of optical and high-frequency spectra of the elements, to a classification of the binding of the electrons in the normal state of all atoms by means of so-called quantum numbers, which has given a complete explanation of the relationships between the elements, as expressed in the well known periodic table. The gradual development of proper methods of quantum mechanics, including the general formulation of the exclusion principle for electron systems, has further allowed a complete understanding of the different types of bindings of atoms into molecules, which in the case of the so-called polar bonds are ascribed to the electrostatic forces between ions in their normal state, and in the case of homopolar bonds, are ascribed to the sharing of a pair of electrons of opposite spins in the same quantum state by two atoms.

Great progress has also been achieved in recent years in our understanding of the structure of matter in bulk, especially as regards the crystalline state. Not only has the analysis of the stationary states of crystals led to a comprehension of the optical properties of solids and of the variation of their specific heats at low temperatures, but it has even been possible to derive, on the basis of quantum mechanics, approximate expressions for the cohesive forces between atoms and molecules responsible for the elastic properties of matter in its different states of aggregation. Moreover, a general theory of the typical properties of the metallic state has been obtained by a quantum mechanical treatment of the ensemble of more or less loosely bound electrons in metals. Such a treatment, in which special regard is taken to the exclusion principle, has also given a most instructive explanation of the magnetic properties of metals, including ferromagnetism. Still, certain remarkable properties of electronic or atomic aggregates at very low temperatures, such as the supraconductivity of metals and the suprafluidity of helium which have not yet found any satisfactory explanation, seem to indicate that some essential feature of the lowest quantum states of these aggregates has as yet escaped us.

Apart from the incessant development of the explanation of the properties of matter on the basis of the original discoveries of the structural units of the atom, quite new fields of atomic theory have in recent years been opened by the discovery of further elementary particles which, like the positron and the neutron, only exceptionally appear in ordinary atomic phenomena, but which play a fundamental part in the problem of the constitution of the atomic nuclei themselves. The first isolation in cosmic rays of a positive charged corpuscle of the same mass as the ordinary elec-

**SPLITTING ATOMS** with a 7,000,000-volt discharge from an electrostatic generator under direction of Dr. Robert J. Van de Graaff at Round Hill, Mass.

tron, now often called negatron, was a most striking confirmation of the rational development of the relativistic quantum theory of the electron, which led to the prediction of the possibility

under certain conditions of the materialization of radiation quanta into a positron and a negatron, and of the inverse process of the annihilation of such a pair of oppositely charged electrons with appearance of radiative energy. It is just the last phenomenon which prevents the stable existence of the positron as a constituent of matter, where only ordinary electrons can be held round the positive atomic nuclei. Positrons are liberated, however, as products of artificial radioactive disintegrations as frequently as negatrons, the sign of the charge depending primarily on the ratio between charge and mass of the radioactive nucleus compared with that of stable nuclei. The liberation process itself must indeed in both cases be considered as the very creation of an electron as a mechanical entity, because such light particles cannot be considered as constituents of quantum mechanical systems of dimensions as small as those of atomic nuclei.

The possibility of treating nuclei as quantum mechanical systems entirely composed of heavy particles was opened by the isolation of the neutron through the study of nuclear transmutations by impact of fast material particles. In the development of a comprehensive theory of nuclear constitution based on a model of the nucleus composed of neutrons and protons in numbers indicated directly by its mass and charge we meet, however, with a problem which in some way is the inverse of that of atomic constitution, the characteristic simplicity of which lies in the possibility of identifying the forces between the constituent particles with the ordinary electric attractions and repulsions. In fact, the stability of nuclei claims the existence of forces of a novel type between protons and neutrons, appearing at small distances, and the character of which can only be gradually explored by the study of the nuclear phenomena themselves. Still, without a precise knowledge of the intranuclear forces, a most instructive explanation of the fundamental probability law of radioactive decay under emission of heavy charged particles has been obtained on quantum mechanics which permit the passage of such particles through a region outside the nucleus, where the potential energy corresponding to electrostatic repulsion is higher than the kinetic energy of the released particle, and the penetration of which would thus be impossible on classical mechanical ideas.

A more detailed theory of nuclear phenomena is, however, above all confronted with the difficulty that, owing to the close packing of the nuclear particles, no such approximative procedure as that applied with so great success to the classification of the binding of the individual electrons in the extranuclear configurations of atoms by means of quantum numbers is legitimate. On the contrary, we have in the normal and excited states of nuclei to do with types of motion of an essentially collective character, which must be quantized in a similar way as the states of molecular aggregates, as also appears clearly from the great differences between the distribution of the energy levels of nuclei compared with those of atoms. In particular has the study of nuclear transmutations revealed that the level distribution of a nucleus for high excitation is practically continuous, and that every impact between a fast particle and a nucleus leads, in the first place, to the formation of a semi-stable compound system, the eventual subsequent disintegration of which is to be considered as a separate event, independent of the first stage of the collision process. In this intermediate state the energy is stored in the compound system in a way similar to that of the thermal energy of ordinary bodies, and by introducing, in accordance with this comparison, a suitable definition of the temperature of the highly excited compound nucleus, it has been possible to treat the disintegration phenomena in close analogy to the evaporation processes of liquids and solids.

DR. ROBERT J. VAN DE GRAAFF demonstrates machine for accumulation of 20,000,000 volts of electrical energy

**Mauritania:** see FRENCH WEST AFRICA AND THE SAHARA.

**Mauritius,** a British crown colony consisting of an island in the South Indian ocean, about 1,400 mi. from the coast of East Africa, lying between lat.  $19^{\circ} 50'$  S. and long.  $57^{\circ} 18'$  and  $57^{\circ} 48'$  E., together with a large number of small islands. The governor and commander-in-chief is Sir Bede Clifford, K.C.M.G., who in May 1937 succeeded Sir W. E. F. Jackson, K.C.M.G.; he is assisted by an executive council and a council of government. The capital is Port Louis. Area: 720 sq. mi.; est. pop. (1936) 410,920, including 11,042 in the dependencies. Elementary education is free through Government- and State-aided schools. Advanced education is provided by the Royal college and the Royal college school, managed by the Government. There are 500 mi. of exceptionally good metalled roads, and 110 mi. of Government railways. There are telegraph and telephone services and a private broadcasting station. The chief product is sugar, the 1936 output reaching a record of 300,340 metric tons. Exports in 1935 were valued at Rs. 29,891,160, and imports at Rs. 26,895,460.

The unit of currency is the Mauritius silver rupee (par exchange, Rs. 15 to the pound sterling), which has silver subdivisions. Revenue in 1936 was Rs. 15,350,986, and expenditure Rs. 14,694,644.

**Mayo, Henry Thomas** (1856–1937), American naval officer, admiral, commander-in-chief of the Atlantic Fleet during the World War. He was born in Burlington, Vermont, Dec. 8, 1856, and was graduated from the U. S. Naval Academy in 1876. During his early career he was engaged in scientific work with the Coast and Geodetic Survey and the Naval Observatory. After serving as commandant of the nav-

yard at Mare Island, Calif. (1911-13), he was made commander of the 4th division of the Atlantic Fleet with the rank of Rear Admiral. While stopping at Tampico, Mexico, in April, 1914, he precipitated the Mexican crisis by ordering a salute to the American flag to make amends for the arrest of some American sailors while loading gasoline into a whaleboat. When General Zaragosa refused to comply, the entire Atlantic Fleet was sent to Mexican waters and the city of Vera Cruz was occupied by the United States for several weeks. In 1917 Admiral Mayo represented the United States at the allied naval conference in London and after the World War, in the flagship "Pennsylvania," escorted President Wilson to the Paris Peace Conference. His last posts were commander-in-chief of the United States Fleet (1919) and member of the Navy General Board (1920-21). He died in Portsmouth, N.H., Feb. 23, 1937.

**Measles.** Notwithstanding the many years that have elapsed since measles was first recognized as an infectious disease, distinct from scarlet fever, the exact cause of the condition has not been certainly determined. A step in advance developed during 1937 when Drs. Jean Broadhurst, Margaret Estelle Maclean and Vincent Saurino isolated certain inclusion bodies in the nasal membranes of patients with measles and in the white spots which appear in the mouth in this condition known as Koplik spots. The bodies described were seen on the first day of the disease and seem to be uniformly present from the second day to at least the twelfth day. Similar bodies are not found in people who do not have measles; neither are they found in various other types of infection. The physicians who carried out their work in the Institute of Practical Science Research of the Teachers College of Columbia university in New York city worked out a special staining technic involving the use of a dye called nigrosin. The inclusion bodies could not be found when using ordinary bacterial stains. The nigrosin does not dye the bodies of the bacteria but does indicate the measles inclusion bodies. While it is not certain that these are the cause of the disease, they are apparently specific for their presence in that condition. (M. FL.)

**Meat.** The largest meat-producing countries in the world, New Zealand, Australia and Argentina, are also the largest meat eaters, their total consumption of meat per head being well over 200lbs. The people of Argentina eat most beef, averaging more than 200lbs. per head, but only 13lbs. of mutton and lamb and 35lbs. of pork. New Zealanders consume most mutton and lamb, about 100lbs. per head, 150lbs. of beef per head and 18lbs. of pork. Australians eat 140lbs. of beef per head, 70lbs. of mutton and lamb and 20lbs. of pork. Germany appears to be the largest consumer of pork, with 76lbs. per head of the population, with Canada, United States and Denmark running her close. The meat consumption in Great Britain, the United States and Canada averages about 140lbs., of which pork accounts for about half on average, and beef for most of the remainder in the case of the first two named, while in Great Britain beef represents 65lbs., pork 45lbs. and mutton 30lbs. Less meat generally is consumed in European countries. Germany eats more pork than beef, France more beef than pork, and neither any material amount of mutton, their aggregate consumption of meat being approximately 100 and 90lbs. per head respectively.

International trade in beef and mutton is largely a movement from the northern to the southern hemisphere while world trade in pig meat is mainly confined to the northern hemisphere. Argentina is by far the principal exporter of beef, with Australia supplying second place, although the meat equivalent of the Irish Free State's exports of live cattle would place that country before Australia; then follow New Zealand and Uruguay. The

chief exporter of mutton and lamb is New Zealand, followed by Australia and Argentina. Denmark exports considerably more pig meat than any other country. The British Empire is a net importer of all meats due to the large import demands of the United Kingdom.

The United Kingdom receives by far the largest proportion of world export of beef and is, in fact, the only country with an appreciable demand for chilled beef. The amount of beef imported into the United Kingdom increases each year, and in 1937 was over 10½ million cwts., of which more than three-quarters was frozen. As in the case of beef, the United Kingdom is the chief market for mutton and lamb, taking as much as 95% of the world exports in recent years. Imports into the United Kingdom in 1937 were also heavier than the previous two years, being over 6½ million cwts. Lamb exceeded mutton imports by more than three times.

International trade in pig meat is dominated by the movement of bacon and hams to the United Kingdom. Denmark supplies about half of all the bacon imported into the United Kingdom. In 1937 the United Kingdom imported over a million cwts. of pork and nearly seven million cwts. of bacon. (See also BACON.)

South American countries are the principal exporters of canned meat, the United Kingdom the largest importers, deriving the bulk of its supplies from these countries. The United States is also a large importer of canned meat. (C. A. MOR.)

**Medical Association, American:** see AMERICAN MEDICAL ASSOCIATION.

**Medical Association, British:** see BRITISH MEDICAL ASSOCIATION.

**Medicine.** The outstanding medical advances in 1937 are two related particularly to the treatment of dementia praecox or schizophrenia, and the various uses which have been developed for the drug called sulphanilamide.

For many years scientific medicine has endeavoured to make progress in attacking dementia praecox, a form of insanity affecting youth and leading invariably in the past to progressive degeneration and death. Out of the laboratories now have come two new methods, which are essentially forms of shock treatment, for this condition. One involves the injection of the drug called insulin to the point at which the patient loses consciousness or may develop convulsions due to a lessened amount of sugar in the blood. The other involves the injection of a drug called metrazol which produces convulsions like those of epilepsy.

Now that these methods have been tried on a great number of cases of this disease, reports are beginning to appear of numerous patients who have developed normal mental states and have been able to go back to their families and to their homes, and some of them into useful occupations. In some of the cases, however, there have been remissions and relapses so that return to the institution and renewed treatment have become necessary. In other cases there have been complete failures. It would seem, however, that early use of the treatment, and particularly when combined with the modern methods used in sanatoriums, including physical, laboratory, and scientific therapy, may bring about actual cures in many cases. Here is a new ray of hope in a condition where formerly all was darkness.

In addition to these discoveries in the field of nervous and mental diseases, attention should be called also to the development of the new method of study known as electroencephalography—a method of registering on a visible screen the actual activity going on within the brain. This method yields the possibility of great help in the diagnosis of various forms of diseases affecting the brain. It is particularly important to realize that

scientific measurements mean actual science in contrast to the guesswork on which previous procedures may have been based.

The third field of interest in nervous and mental diseases is the use of surgery in the treatment of certain forms of psychoses or mental conditions. Operations have been developed in Washington, D.C., and in Montreal which involve crushing of portions of the brain and removing portions of the brain. All of this work, however, is in much too early a stage to indicate any established usefulness.

**Sulphanilamide.**—In 1935, the investigator Domagk announced the development of a dark red dye substance which is the hydrochloride of 4'-sulphamido-2:4-diaminoazobenzene. This drug was known by various names, among them "prontosil." From this there came the further development of prontosil which is paraamino-benzenesulphonamide which is a white powder and not a dye. This is known as sulphanilamide. Now that these two drugs have had extensive use in various parts of the world, much credit is given to them for the control of diseases formerly uncontrollable. For instance, the drugs are specific apparently against certain forms of streptococcus known as beta haemolytic streptococcus. Formerly, meningitis caused by these germs was invariably fatal. Already innumerable cases have been reported of recovery from such meningitis following the use of sulphanilamide.

The drug has also been found of value in the treatment of type three pneumonia; in the specific treatment of gonorrhoeal infection of the eyes, particularly ophthalmia neonatorum, the infection of the eyes of the infant at birth; in other forms of meningitis than those due to the streptococcus; in certain cases of infection at childbirth; and finally in the treatment of infections of the mastoid bone, so that cases are reported of recovery in this condition without surgical operation.

So intense was the interest during the year 1937 in the new developments associated with this drug that one of the major disasters in medical practice in the United States resulted from this intensity of interest. The drug is available chiefly in the form of tablets, and in special solutions developed for injection. Because of its usefulness, attempts were made to develop solutions which could be taken by mouth, but the drug may be unstable in chemical combinations, and thus far no stable solution has been accepted by the Council on Pharmacy and Chemistry of the American Medical Association. It occurred, however, to a manufacturer to dissolve the sulphanilamide in a solvent known as diethylene glycol. This solvent is well established for various industrial purposes, but has never been considered suitable for internal use; in fact, the Food and Drugs Administration of the Department of Agriculture had ruled that it be not used in food substances. The manufacturer distributed well over 700 packages of the preparation, either as samples directly to physicians, or else to individual drug stores or wholesale drug houses. Shortly thereafter reports began to appear of sudden death following the taking of this elixir of sulphanilamide, in practically every instance death resulting from uraemia as a result of the effects of the diethylene glycol on the kidneys of those who had taken the preparation. Acting as a hygroscopic agent, the diethylene glycol completely blocked the flow of fluid through the kidneys, with death from uraemia as the inevitable result. Seventy-three deaths were established as resulting from the taking of this mixture and there may possibly be 20 others. By prompt action, the Food and Drugs Administration recovered every package of the material, and a special message has been sent to Congress urging amendments to the food and drugs legislation which will prevent such an occurrence in the future.

**Vitamin Research.**—Among the greatest of all the interests that have developed in recent years is the new attention paid to

the vitamins. The Nobel prize in medicine for 1937 was awarded A. von S. Gjörge for his investigation related to the isolation and synthesis of vitamin C. In connection with the vitamins there was announced during 1937 the synthesis of vitamin B<sub>1</sub>, the isolation of a new anti-haemorrhagic vitamin, the development of new standards for vitamin D milk, the development of crystalline vitamin A, and the identification of nicotinic acid as possibly identical with one of the fractions of vitamin B. All of these discoveries are of immense importance in relationship to the vitamins in controlling various forms of disease.

Moreover, in connection with the use of vitamin A, a device has been developed known as the biophotometer, by which it is possible to determine through examination of the eye whether or not a person suffers from a vitamin A deficiency. One of the early symptoms of vitamin A deficiency is the development of night blindness. It is possible that some of the motor accidents occurring particularly at night may be the result of a deficiency of this vitamin in the diet.

**New Materials and Apparatus.**—Among the new drugs which have been accepted during 1937 as having special value in various diseases, attention must be given to protamine zinc insulin which, when injected, has a longer and more gradual effect. By the use of this preparation, a person who has been taking three injections of insulin daily may be able to get along with two a person who has taken two injections may be able to get along with one. Mandelic acid has been found of special value in the treatment of infection of the kidney and of the urinary tract.

Among new anaesthetics, particular attention must be given to two new products known as vinathene and pantocain. The search for new anaesthetic substances continues with a view to finding something less toxic than those already in use and which may be easier to administer. Indeed, the development of new methods of anaesthesia represents one of the greatest contributions of medical science in the current century.

In the condition called myasthenia gravis, which is a disease affecting the nervous system, the muscles gradually waste away and lose their strength. In this condition, the product called prostigmin has been found to be of special value.

Interest attaches also to the product called benzedrine sulphate now frequently inhaled during a common cold in order to relieve congestion in the nose. Taken internally, this drug has been useful in raising the blood pressure, but also particularly in stimulating the brain. For a while there developed a craze for its use among university students who took the drug in order to think better and keep more wide awake during examinations. Since it was shown, however, that the stimulating effect of the drug on the heart and the blood pressure may be serious in certain cases, students everywhere have been warned against the routine use of such preparations.

In the field of physical devices some exceedingly interesting developments have occurred, particularly in the improvement of artificial apparatus to aid the hearing; in the development of new types of tents to be used by patients undergoing treatment with oxygen for pneumonia and similar conditions, and the new type of respirator for maintaining the breathing particularly in cases of paralysis of the nerves and muscles involved in breathing which occurs in infantile paralysis. The new type of respirator or iron lung represents an improvement because it covers only the upper half of the body and does not involve the insertion of the complete person into the apparatus.

Other forms of apparatus include a new type of machine for causing alternating filling and emptying of the blood vessels, a useful method of treatment in such conditions as Buerger's disease, Raynaud's disease, and others affecting the circulation of the blood in the legs.

Apparatus has been developed for the use of short-wave radiations in raising the temperature of the body. Improvements have been made in various types of cabinets for administering heat in the treatment of such conditions as syphilis, arthritis, gonorrhoeal infections, and other conditions in which heat has been shown to be of value.

Since it has been established that many people are particularly sensitive to dust, feathers and dandruff, new types of mattresses and pillows have been developed encased in materials which prevent the inhalation of dust or of dandruff.

**Sensitivity.**—More and more attention is being given to all forms of sensitivity of human beings to various substances. Today basic studies are made on the chemistry of the body and its functions in relationship to sensitization. It has been found that there may be sensitivity to chemical substances, that the patient who is sensitive has a normal tolerance for sugar, that probably the amount of calcium and potassium circulated in the blood is not of particular importance in relationship to sensitivity. It has been found that sensitivity to certain foods may produce a fever in the human body, that there are important changes in the blood in connection with some forms of sensitivity, and that people who are sensitive to some foods may develop excessive bleeding. Finally attempts have been made to develop extracts and concentrates of the pollens and other protein substances, with the idea that these substances taken internally might develop desensitization. An extensive study of these methods has not proved that this is a helpful procedure.

**Surgery.**—In the field of surgery, attention has centred largely on the possibility of performing various surgical operations on the heart so as to increase the blood supply to the tissues of the heart after various types of disturbances, and also on operations which are performed on the nervous system with a view to benefiting high blood pressure and other conditions related to disturbances of the so-called sympathetic nervous system.

**Vaccination.**—Since the attack on the infectious diseases continues to be one of the chief problems of medical science, special attention must be paid to the new experiments in relationship to infantile paralysis which have demonstrated that in the vast majority of cases the infection enters the human body by way of the nose, and that it may be possible, through the use of various solutions, to obstruct the entrance by way of the olfactory nerves in the upper part of the nose. It is possible that the specific virus causing measles may have been isolated. Apparently rabies or hydrophobia tends to develop rapidly whenever preventive medicine relaxes its vigilance, and the increase in rabies in the southern portion of the United States has been pointed out as a prominent problem.

In the treatment of pneumonia, new serums have been developed for types of pneumonia 5, 7, 8 and 14 that seem to be as good as the pneumonia serum for pneumonia types 1 and 2. Experiments, using the blood of rabbits, have shown that serums may be developed from the rabbit for pneumonia types 1, 2, 7 and 8, with the possibility that the unconcentrated rabbit serum is more useful than the old concentrated horse serum. Moreover, in the treatment of pneumonia there has been the development of a compound of quinine which seems to have specific action on the germ of pneumonia, and at the same time to be free from harm to the nerves.

In the prevention and treatment of whooping cough there has been taken place further refinement in the vaccines used for this purpose. In Denmark particularly most encouraging reports have been forthcoming. In Denmark also experiments have been done with toxoid against diphtheria which has been used intravenously, and also the application of solutions on the mucous membrane of the nose. These constitute routes that are alternatives to the

injection under the skin of this preventive preparation.

Extensive experimentation has been made during the year on the possible use of injection of various vaccines at the same time with the possibility that the child may be immunized by one injection or one series of injections against several different diseases.

**Public Health Work.**—Outstanding among the campaigns in the field of preventive medicine during the year was the enlightenment of the public on syphilis and gonorrhoea. These venereal diseases, formerly shrouded in mystery because of public modesty, now are attacked through public campaigns in the press, before forums, and over the radio. The new attack on syphilis is supported by the appropriation of millions of dollars in the campaign, and by the application of new methods of diagnosis and treatment, which indicate that with proper education of the public and of the medical profession, the application of the new methods may bring about a tremendous lowering of the incidence of these diseases. Especially to be mentioned are fever treatment in many forms of gonorrhoea, the use of sulphanilamide for gonorrhoeal infections of the eyes of children, and improved methods in the use of bismuth and arsenic. During the year, three States adopted a law making it compulsory to have a test of the blood for the presence of syphilis before issuing a marriage licence.

Increased attention by the medical profession to deaths from motor car accidents is bound to bring about a favourable effect on this problem. The fact that almost 40,000 people are killed each year in the United States, more than 100,000 seriously injured, and a million other people injured in moderate degree is an indication of the importance of this problem. Whereas motor car accidents did not appear on the list of causes of death 30 years ago, it is today somewhere between seventh and tenth in importance.

Problems of health, important from the public health point of view, which have had special attention during the year include new studies and new apparatus for air conditioning; demands for new legislation controlling the purity and safety of foods, drugs and cosmetics; investigations as to the health hazards involved in contamination of fruits and vegetables by the method of spraying to prevent parasitic infestation.

The increasing importance of industrial medicine caused the American Medical Association to establish a special Committee on Industrial Medicine which is to concern itself with these problems. (See also BIOCHEMISTRY: *Medicine*; INFANTILE PARALYSIS; SURGERY; VITAMINS.)

(M. FL.)

**Mediterranean, The.** During the year 1937 the Mediterranean has been the scene of important events and developments. The Civil War in Spain, the limitation of which to the peninsula became of such importance to European peace, gave birth to an experiment in isolation. A "pacific blockade," though warmly espoused by some persons in Great Britain, was clearly seen to be both impossible and useless. In place, an arrangement for observation of the Spanish coasts and land frontiers was established. Supervisors were to be embarked on board ships bound for Spanish ports, whose duty it was to superintend the unloading of ships in those ports and ensure that they carried neither arms, munitions, nor volunteers. At sea, the Navies of the United Kingdom, France, Germany, and Italy were to patrol in certain zones off the coast and report, to the International Committee for Non-intervention, the arrival within their zones of ships which had either not been under supervision or which refused to submit to examination.

The Spanish Mediterranean coast was divided for this purpose into zones. The coasts of Spanish Morocco, Majorca, and Iviça were allotted to France; from Gibraltar to Cape Gata to Great Britain; from Cape Gata to Cape Oropesa to Germany; from

Cape Oropesa to the Pyrenees frontier and the island of Minorca to Italy. Thus, the distribution was so made that the Powers whose duty it was to prevent supplies and volunteers from reaching the coast were those whose political sympathies might be expected to make them vigilant in excluding shipping.

The arrangement was put into force, but not for long. In consequence of a submarine attack reported to have been made upon the German cruiser "Leipzig" when cruising at sea, and of the bombing of a German armoured cruiser in harbour, Germany withdrew from the observation scheme. Her place was taken by the British and French Navies.

As the civil war continued, attacks were made upon the shipping of the neutral nations, indiscriminately, by flotilla craft, submarines, and aircraft whose nationality was not known. Ships were fired upon, torpedoed, or bombed. To bring this to an end, an arrangement was made, by an international committee sitting at Nyon, to patrol the sea routes, Great Britain, France, and Italy being allocated zones in the routes. After some difficulties, arising out of Italy's representation that too small an area had been placed in her control, the scheme was put into operation and met with success, the "piratical" attacks ceasing almost entirely. Later, the scheme of coastal supervision came to an end.

In the Balearic Islands, Minorca, with its small but excellent harbour Port Mahon, has remained in the hands of the Spanish Government. Majorca, which was occupied and brought under the control of the insurgents by Italian forces immediately on the outbreak of the civil war, has been kept in Italian hands. Although strong assurances have been expressed by General Franco that he will allow no portion of Spanish territory whatever to pass out of Spanish possession, there has been an unavoidable anxiety both in Britain and France lest circumstances may prove too strong for him. Majorca, situated as it is, closely flanking the lengthwise traffic of the Mediterranean, is of particular importance to Great Britain, while the crosswise traffic between France and her North African Empire, forming an essential link in the French military communications, is of no less importance to France. The occupation, therefore, of that island by a powerful naval and military Power could never be a matter of indifference to either of those Powers.

A new Italian base has been in the course of development in the island of Pantellaria. Lying as this island does in almost the narrowest part of the sea between Sicily and Tunis, its development as a naval and air base introduces a new element into Mediterranean strategy.

How far the increasing power of aircraft will affect either the command of the sea, or the continuance of traffic by sea in those

regions within the range of aircraft has been a matter of speculation for some years. According to the views of one school of thought, aircraft will render it impossible for ships of war to operate at sea, for merchant shipping to traverse sea routes, or for ships to lie in harbours within the reach of aircraft. The experience of the year 1937 in the Mediterranean has not confirmed these expectations. Ships of war and merchant ships have not been prevented from moving along all parts of the Spanish coasts, or from lying in Spanish harbours. The experience is for many reasons, of too limited a nature to enable definite conclusions to be drawn, but, such as it is, combined with the experience of the Yangtze in the Sino-Japanese war, it does not lead to the conclusion that either the bases of the British fleet in the Mediterranean would be rendered untenable in war by aircraft or that ships of war would be unable to move or to afford protection to shipping at sea. The fact that Pantellaria, lying within a short distance from the mainland of a foreign State, is being developed as a base, appears to indicate that Italian technical opinion does not share in the belief in the untenability of a position so situated.

In the eastern basin of the Mediterranean the serious disturbances, calling for the use of a comparatively large body of troops, have continued in Palestine, unbroken by the proposals of the Peel Commission.

Arab hostility to the Mandate has shown itself as fixed as it has been from the beginning. The position in the Mediterranean is affected by the repercussions of this unrest. If Great Britain should find herself involved in war, the situation in the Mediterranean would be affected if the oil supplies of the forces operating in the Mediterranean were threatened on land. The pipeline from Mosul, which brings the oil to the coast at Haifa, would be exposed to injury from a hostile population. The quantity—some 5.1% of the British imports of oil—may not seem considerable, but it is by no means negligible; and still less negligible would the strategical disadvantage be of being unable to supply the fleet in those waters from so convenient a source of supply.

Hence, as has happened in analogous situations in the past, it might prove necessary to despatch military forces to guard the land line of this supply; and, as much experience has shown, it is not possible to predict the limits to which such action might extend.

The other disturbing feature in the eastern Mediterranean has been the constant stream of anti-British propaganda which has

DELEGATES from nine nations meet at Nyon, Switzerland, to establish naval patrol against "pirate" submarines, aeroplanes and warships in the Mediterranean.

been poured from the wireless station at Bari into the Near and Middle East. Reference has been made to this in the British Parliament, and representations made to Italy. Recent Italian writings have displayed a tendency to represent Great Britain, both in the past and present, as the obstacle to Italian expansion and the creation of a *mare nostrum*.

The possibility that it might prove necessary, or desirable, to divert in war some of the British trade which now originates in, or passes through, the Mediterranean, has been a question that has attracted increasing attention in British circles. The British imports on the Mediterranean route amount to a little less than one-fifth of the whole British import trade; and of that, somewhat less than a half comes from east of Suez, somewhat more than a half comes from countries bordering the Mediterranean and the Red sea. Diversion of some of this round the Cape of Good Hope has many obvious economic disadvantages: longer voyages; great consumption of fuel by fuel carriers; heavier demands upon mercantile tonnage which, as the last war showed, must be used to its utmost effective power; loss of the freights and the trade normally conducted with intermediate ports; and the effects of all of these upon competition, always acute, in sea carriage—these cannot fail to be serious.

Against these disadvantages must be weighed the strategical disadvantages of affording protection. The possibility that diversion might in certain circumstances be needed is reflected in the extensive development which is now in progress at the harbour of Table bay.

A joint declaration on Jan. 2, 1937 was made by the British and Italian Governments, which recognized that "freedom of entry into, exit from, and transit through the Mediterranean is of vital interest both to the different parts of the British Empire and to Italy," and disclaimed any desire to modify the *status quo* in the Mediterranean; and each undertook to respect the other's rights and interests in that area. In answer to a specific question asked by the British Ambassador on Dec. 31, 1936, as to whether Italy intended that "the integrity of the present territories of Spain shall in all circumstances remain intact and unmodified," Count Ciano replied that such was Italy's intention. (See also INTERNATIONAL LAW: *Civil War*; ITALY: *History*; NON-INTERVENTION COMMITTEE; SPAIN: *Civil War In*.)

(H. W. R.).

**Mellon, Andrew William** (1855–1937), American statesman and financier, for a time referred to as "the greatest secretary of the treasury since Alexander Hamilton" and one of the world's wealthiest men. Born, March 24, 1855, he inherited a million dollars which grew several hundred times during his lifetime. This was made possible by the establishment of control over aluminium production, by real estate investments in Pittsburgh, and by participation in the affairs of over sixty corporations. At 66, he resigned all financial connections to become Secretary of the Treasury under Presidents Harding, Coolidge and Hoover. His administration was marked by debt and tax reduction made possible by a period of unprecedented prosperity. Following international financial negotiations in 1931, he was appointed ambassador to England. He resigned this post on his seventy-ninth birthday (1934). Soon after his return to the United States, he was unsuccessfully prosecuted by

the Federal Government for tax evasion and a few months before his death steps were taken to dissolve his \$174,000,000 aluminium company as a monopoly. His philanthropies, including large contributions to the Carnegie Library of Pittsburgh, the Carnegie Institute of Technology and the Mellon Institute of Industrial Research, were climaxed by provision for erection of a National Gallery of Art at Washington and the gift of his collection of paintings, valued at over \$19,000,000, as a nucleus. The will covering the large estate remaining in his hands upon his death at Southampton, L.I., Aug. 26, 1937, provided for the establishment of educational and charitable trust funds. Further information regarding his career may be found in the *Encyclopædia Britannica*, vol. 15, p. 226.

**Mellon Art Gallery (National Gallery of Art):** see ART EXHIBITIONS.

**Memel Territory**, a long strip of land along the right bank of the river Niemen on the frontier of East Prussia, comprises 976 sq.mi., and a population of about 150,000. According to the German census of 1910 this region had a population of 140,766, of whom 71,191 spoke German as their mother-tongue, 67,345 Lithuanian, and 1,970 were bi-lingual. The Germans greatly predominated in the town and port of Memel, the Lithuanians in the rural districts. By the Versailles Treaty Germany was compelled to cede the Memel Territory to the four principal Allied Powers. While they were delaying as to its final disposition, the armed forces of Lithuania suddenly burst in and occupied it in January, 1923. The Powers accepted the situation but tried to regularize it by the Convention and Statute of May, 1924. Memel Territory was to be part of Lithuania but was promised large autonomy. Its Government was placed in the hands of a governor appointed by Lithuania; an elected chamber of representatives (*Landtag*); and a directorate of five; the president of the directorate is appointed by the governor, but he himself appoints the other four directors.

Unfortunately racial hatred between Memellanders and Lithuanians prevented the smooth working of the Government. The first Landtag, elected in Oct. 1925, was composed of 27 Germans and 2 Lithuanians—a striking indication of the German sympathies of the Memellanders, even of those whose mother-tongue is Lithuanian. Lithuania, irritated by this, used all sorts of coercion to restrict the enjoyment of the promised autonomy and to lessen German influence. In 1934, 538 German employees were dismissed and 126 Germans were accused of treason before a Lithuanian military tribunal. Before the election of Sept. 1935, German newspapers were illegally suppressed, four candidates were deprived of citizenship to prevent their election, and some 9,000 Lithuanians were given the vote.

By an expropriation law of Sept. 6, 1937, Lithuanian authorities began to seize German land for barracks and other public buildings without consulting the local authorities and without assuring adequate compensation. President Baldiszus protested in the Landtag that this was contrary to the terms of the Memel Statute of 1924 and his protest was adopted by an overwhelming majority. See Art MEMEL in *Encyclopædia Britannica*; and Ian F. D. Morrow, *The Peace Settlement in the Polish-German Borderlands* (Oxford Univ. Press, 1936).

(S. B. F.).

**Mercury.** World production of mercury declined from 5,600 metric tons in 1929 to a low of 2,040 tons in 1933, and recovered to about 3,900 tons in 1936. The leading producers are Italy, Spain and the United States; over the past 25 years, the distribution of the output has been one-third each from Italy and Spain (with Italy slightly in the lead), and one-sixth

from the United States, the remainder being divided among a large number of minor producers, the chief of which are Mexico and the Soviet Union. The present distribution is not greatly different from this, except that Italy has taken a somewhat greater lead over Spain. In the extreme, Italian production has fluctuated between 52% and 17% of the total, Spanish between 48% and 17%, and the United States between 30% and 7%. Austria was formerly a producer on about the same scale as the United States, but in the readjustment of territory after the World War lost the producing district to Italy; without this addition to production capacity, Italy would rank below Spain, instead of above.

Italian production was 2,000 metric tons in 1929, 440 tons in 1934, and 1,470 tons in 1936; 1937 brought another sharp increase, and the output for the first seven months of the year was reported greater than the total for 1936. Spanish production dropped from 2,500 tons in 1929 to 660 tons in 1930, and recovered to 1,200 tons in 1935; due to the civil war, nothing has been reported for 1936 beyond the bare statement that production increased over 1935. Sixty years ago the United States supplied two-thirds of the world total, but the highest figure in recent years was 860 tons in 1931, dropping to 330 tons in 1933, and increasing to 600 tons in 1935; 1936 declined again, to 570 tons.

Recent increases in output have been due not only to general industrial improvement, but also to rearmament demands.

(G. A. Ro.)

**Metallurgy.** There was nothing spectacular in metallurgical advances in 1937, but the fluctuations in the prices of non-ferrous metals left company executives giddy. Electrolytic copper opened in London at £54½ per ton, advanced to a high of £79 per ton in March, and closed at £43¼. Lead opened at £26⅞ per ton, attained a high in March of £36, fell to £15½. Standard spot tin opened at £228⅜ per ton; advanced to £301 in March, and closed at £181¼. Zinc opened at £18⅞ in London, rose to £36¼ in March, and closed at £15½. American prices paralleled this record of extraordinary instability.

A short résumé of technical developments follows:

**Copper.**—Advances during the year were largely confined to fabrication, such as improvement in the extrusion of such alloys as cupronickel, aluminium bronze and aluminium brass and to the bright annealing of copper and all copper alloys.

**Gold.**—The continued high price of gold resulted in great activity but no great changes in metallurgy. Dredges were increasingly complex; what used to be very simple affairs becoming highly developed floating metallurgical plants. At Wiluna Gold Mines, Ltd., in Australia, novel metallurgy was introduced into the treatment of an antimony-gold ore, formerly treated by cyanidation. (See also GOLD.)

**Iron and Steel.**—The year 1937 was marked by much attention to the quality of pig iron, both as produced by the blast furnace

and as remelted in the cupola. German metallurgists did much in the way of developing chrome-molybdenum steels carrying 0.2 to 1.2% molybdenum that were decidedly cheaper and probably stronger than much more expensive chrome-nickel steels. A drawback of the new steels was a very narrow limit in the proper heat-treatment range, but labour for close attention to this point was cheaper than nickel. The Germans also extended their previous work on manganese as a substitute for nickel in certain austenitic steels. Casehardening by the zirconium group appears to have made substantial progress during the year. The production of aluminium-coated steel reached large scale commercial production both for wire and plate.

**Lead.**—There were no marked changes in lead-smelting practice during 1937. At the Trail, British Columbia, blast furnaces, a large number of small tuyeres were substituted for a small number of large tuyeres, apparently with good effect. The continuous desilverizing process introduced at Port Pirie, Australia, was reported as a complete economic success; but was not adopted elsewhere. The first published descriptions of the Northfleet, Kent, lead refinery appeared in 1937. This is one of the world's large refineries and is supposed to embody the best modern practice. It operates on bullion from Mount Isa, Queensland, and produces lead, silver, arsenic, antimony and copper. The process is a Betterton modification of the Parkes process. The world's tallest stack, 605½ ft., was completed at the Selby, Calif., smelter of the American Smelting & Refining Co.

A new important low-cost lead-zinc producer came into production in Yugoslavia, when Kopaonik Mines, Ltd., began shipments to the Trepca concentrator.

**Tin.**—The International Cartel continued in full control of tin production throughout most of the world. The high price of tin greatly stimulated research both for tin substitutes and in the use of electrolytic tin coatings requiring a smaller amount of tin to replace the hot-dip plate now used.

**Zinc.**—The introduction of vertical retorts into Germany was probably the outstanding development of 1937. Eight retorts were completed at Oker to treat the Rammelsburg complex ore, with a rated capacity of 10,000 metric tons per year, and another unit was under construction. Electrolytic zinc capacity increased greatly. The Sullivan Mining Co. of Kellogg, Idaho; the Hudson Bay Mining & Smelting Co., Flin Flon, British Columbia; and the Government subsidized plant at Magdeburg, Germany, all increased their capacity. The U.S.S.R. projected a new plant for the Altai district. Republic Steel Co. has begun electrogalvanizing operations on a large scale near Chicago, Ill. The production of zinc-coated strip in coils with a heavy plating sufficiently ductile to withstand fabricating operations was announced as a commercial success.

**Miscellaneous.**—Showing the use of fundamental investigations, the application of what was originally a purely scientific idea, that of the "Beilby layer" (an amorphous film on the surface of metals) and a comparatively new research technique, that of electron diffraction, have resulted in a practical result of interest to all automotive engineers and in fact to all users of motor cars. An aluminium piston anodically oxidized has a surface layer of aluminium oxide. In "running in" the piston, this aluminium oxide is converted into crystals that score the cylinder walls.

The above values are to be regarded as provisional, and subject to slight corrections. Gaps in the tables indicate that the corresponding data are not yet available.

If a layer of magnesium spinel,  $Mg_3(Al_2O_3)_2$ , is substituted, a permanently amorphous coating of better wearing properties is substituted.  
(D. M. L.)

**Meteorology.** For the country as a whole, precipitation in the United States for 1937 averaged slightly above

normal. Only one other year, 1932, has received as much as normal moisture since 1929. The annual falls by States for 1937 ranged from a maximum of 58.87 in. in Louisiana, which was somewhat above normal, to 8.71 in. in Nevada, 99% of normal. However, precipitation for the year was unequally distributed geographically. In the eastern States and the western portions of the country the annual totals were generally above normal, with some Middle Atlantic sections having the heaviest precipitation on record. On the other hand, the amounts were markedly deficient in the Great Plains area from South Dakota southward to Texas, with many localities having only about three-fourths of normal. An outstanding feature of the 1937 precipitation was excessive rainfall in the Ohio valley in the month of January, resulting in the greatest flood of record in that area. During the latter part of the year there was a general tendency to subnormal precipitation in most sections of the country. At the close of the year moisture, especially the subsoil moisture, was markedly deficient in the Great Plains States, but elsewhere conditions were satisfactory rather generally. In the United States there has been a general tendency to subnormal precipitation and above normal temperatures since 1929.

In the United States the year 1937 had more than normal sunshine. There was a slight excess of cloudiness in the north-central portion of the country, and also in the lower Mississippi Valley and western Gulf area, but in all other sections there was less cloudiness than in a normal year. The number of hours of sunshine in 1937 ranged from a total of 4,093, or an average of 11.2 hr. per day for the entire year, at

Yuma, Ariz.; to 1,851 hr., or an average of 5.1 hr. per day, at Binghamton, N.Y. For sunniness New Mexico, with an average of 10.1 hr. daily for the year, was a close second to Arizona, and for cloudiness the upper Great Lakes region, with an average of 5.5 hr. daily was a close second to Southern New York. Normally South-western Arizona and South-eastern California, with an average of about 4,000 hr. of sunshine per year, is the sunniest

portion of the United States, and the north Pacific coast, with about 1,800 hours annually, the cloudiest. For the summer months, June, July, and August, in a considerable south-western portion of the United States there is an average of 13hr. of sunshine daily. The winter season is the cloudiest when parts of the north-east and extreme north-west portion of the country have an average of only 2 or 3 hours of sunshine daily. (W. R. GR.)

Temperatures were well above normal over North-western Europe and the Arctic during January and February, and were unusually high in the Arctic during March. This led to an early southward drift of the Arctic ice in early March, bringing a spell of cold weather in the countries bordering on the eastern Atlantic. Rainfall was generally above normal over most of Europe during the months January to June, with temperatures above normal. During July, temperatures were consequently above normal over most of north-western and northern Europe, and over North America, very high temperatures being recorded in Canada from July 6 to 12. In October, floods followed heavy rains and thunderstorms in the Pyrenees, northern Spain, Tuscany, the Riviera, and Yugoslavia. November was mild over most of Europe, with abnormally low temperatures in eastern Siberia, and in the south-eastern part of the United States. During December, temperatures were below normal over nearly the whole of Europe, over Central Asia, and over the central regions of the United States.

In Australia, rainfall in January ended a drought, and rainfall was generally above normal in March. During the months April to October, rainfall was generally deficient, except in May in South Australia, Western Australia, and Tasmania, where it was above normal. During November, rainfall was above normal over most of the continent. (See also ARCTIC EXPLORATION: *Weather Forecasting*.) (D. BRU.)

**Methodist Church.** In 1737, John and Charles Wesley preached in Georgia. They were followed by George Whitefield, the evangelist, but no societies were organized. The first society was formed in New York, on what is now John street, in 1766 by Philip Embury, a local preacher from Ireland. At about the same time, Robert Strawbridge began to preach in Maryland. The first Methodist building in America was dedicated in New York in 1768. The first conference of Methodists was held in Philadelphia in 1773. Ten preachers were present, representing six circuits and 1,160 members. In 1784 Mr. Wesley consecrated Thomas Coke a bishop and sent him to America, with Whatcoat and Vasey, to organize the societies into a church. Coke and Asbury met at Barrett's Chapel on Nov. 14, 1784, and sent Freeborn Garrison to call the preachers to a Christmas conference at Lovely Lane Chapel, Baltimore. The Methodist Episcopal Church was then organized, Francis Asbury was elected and consecrated a bishop, deacons and elders were ordained, missionaries were sent to Nova Scotia and Antigua, and the first missionary collection of £50 was raised.

The report for 1784 showed 83 preachers, 47 circuits and 15,000 members. In 1937 there were nearly 18,000 preachers, 17,000 circuits and stations, 550 district superintendents and 1,100 men in special appointments. There were 550,000 enrolled in the Epworth Leagues and 3,915,000 in the church schools. During the year, more than 175,000 were baptized and 140,000 were received into full membership in the church. With work on every continent, there are more than 4,700,000 members. About 27,000 churches and 15,700 parsonages are reported, with a net value of \$455,000,000. This does not include the value of buildings and endowments of 98 educational institutions, 72 hospitals, 45 homes for the aged, 43 children's homes, 46 deaconess homes and 26 homes for business girls, or the property of the Woman's Foreign and Woman's Home Missionary Societies. The churches contrib-

uted \$49,000,000 for local expenses during the year and \$7,750,000 for benevolences or \$12.18 per member. There are 22 effective, 2 missionary, 7 central conference and 11 retired bishops. In 1790, the year of the first census, the population of the United States was 3,930,000 and there were 57,600 Methodists or about 1.5 to every hundred residents. In 1930 the population was 123,000,000 and the Methodists numbered 4,400,000 or about 3.6 per hundred.

Besides the Methodist Episcopal Church there are 18 other Methodist organizations, with a total for them all of 43,000 ministers, 61,000 churches and 9,000,000 members. Native Methodist Churches have also grown from mission work in Japan, Brazil, Mexico and Korea.

The final vote on the union of the Methodist Episcopal, the Methodist Episcopal South and the Methodist Protestant Churches, to be known as the Methodist Church, will be taken at the General Conference of the Church South in May 1938. The other two General Conferences and the Annual Conferences of the three churches have already voted favourably. (See also SUNDAY SCHOOLS.) (T. P. P.)

**Great Britain.**—There are in Great Britain 14,617 Methodist churches (an increase of 21 since 1936), with 828,950 members and probationers, an increase of about 10,000, though the net decrease of actual church members is 8,531. The churches have a seating accommodation of 4,052,973. Both Sunday schools and the number of scholars show decreases, there being 484 fewer schools, whilst the scholars (1,056,175) are numerically lower by 66,625.

The total income of the Methodist Church in Great Britain (not including Sunday schools' income or money raised for hospitals and non-Methodist purposes) is approximately £3,950,000.

Overseas, the United Church of Canada has 697,725 members and probationers; the Australasian Methodist Church, 137,149; and the New Zealand Methodist Church, 34,624; while Methodists in Ireland number 30,823. Counting the world over, and including the Methodist Episcopal Church of America, the followers of John Wesley number upwards of 12,000,000.

The annual conference of the Church was held in July at Bradford, Yorks, the Rev. Robert Bond, D.D. (hitherto secretary of the conference), being president, and the Rt. Hon. Isaac Foot, vice-president. This was the sixth conference of the United Methodist Church, and concern was expressed at the decline in church and Sunday school attendances, and emphasis laid on the necessity for an increasing awareness of Christian principles.

Among the subjects discussed were the Wesley Bicentenary, the 200th anniversary of the "Evangelical conversion" of John and Charles Wesley falling on May 24, 1938.

The report of the temperance and social welfare department showed that there were 1,529 Bands of Hope and 3,814 branches of the Abstainers' League. The Order of Christian Citizenship, a strong youth movement, has grown steadily, its members numbering 21,450. Some 2,000 young Methodists participated in an International youth rally at the Albert Hall, London, in January this being the first step towards a projected Christian International Youth Conference in 1939. In 1938 the Methodist Conference will be held in July at Hull, Yorks. The Rev. W. L. Wardle is designated president, and Mr. R. P. Tomlinson, vice-president.

**Metropolitan Museum of Art:** see ART EXHIBITIONS.

**Mexico,** a Federal republic located between the United States and Central America and bordering the Pacific and Atlantic (Gulf of Mexico); language, Spanish; capital, Mexico City; president, Lázaro Cárdenas; area, 767,168 square miles; Population (census, 1930) 16,552,722; (official estimate, 1935) 18,512,837. In 1930 approximately 55% of the population was

mestizo, 29% Indian, and 15% white, with less than 1% (150,000) foreigners. Approximately 14% of the total population speaks only Indian tongues. There are some negro and part negro elements on the Gulf of Mexico coast. The chief cities are: Mexico City, 1,029,068; Guadalajara, 184,826; Monterrey, 137,388; Puebla, 122,914; Mérida, 110,183.

**History.**—Mexico includes 28 States, each with its own governor and legislature and a limited autonomy, and two territories and a Federal district, with governors appointed by the president. The national Government is administered by a president elected for six years, and a congress.

Developments in Mexico in 1937 centred around governmental acts calculated to make effective the six-year plan of 1934, and thereby to bring to an orderly conclusion the social revolution. Economic conditions were apparently good up until mid-year, but real wages were far below the 1934 level, and on Aug. 1, 500,000 workers demonstrated in Mexico City, protesting against the high cost of living. The deceptive prosperity was partly due to a revived demand for minerals and oil from warring Europe and Asia, a depreciation of currency which boomed export trade, new capital investments, a boom in building and public works, and an increased tourist trade. An agricultural crisis raised foodstuff prices considerably, while the nation-wide oil strikes during the summer contributed to a business recession which continued throughout the rest of the year. Various Government emergency measures failed to remedy the situation, and it was a disputed question whether the administration's program of bettering the agrarian and proletarian classes at the expense of foreign and domestic capitalists had been economically sound.

The dominant personality of Mexico was President Cárdenas himself, who continued to maintain a personal hold upon the people stronger than that of any Mexican political leader since Benito Juárez in the mid-19th century. This rested largely upon his ability to dramatize himself, as in his earlier opening of the telegraph offices to the public for free short messages of criticism and suggestion to the central Government and by his literal conversion of old cannon into plowshares, and upon his democracy of manner, exhibited in his insistence upon living in a modest home instead of the traditional presidential palace at Chapultepec.

Politically, the year opened with a split over the attitude to be taken toward Lev Trotsky when he entered Mexico in January. On Feb. 9, Cárdenas issued an amnesty to all political exiles, some 10,000 in number. Former President Calles was the sole exception. In the July primaries the National Revolutionary party (the official party) won a heavy majority in congress. In August a political crisis developed in which Minister of Agriculture Saturnino Cedillo, last remaining Calles partisan in the cabinet, was forced out of office. He retired to his own State of San Luis Potosí and began raising a private army. President Cárdenas proceeded against him with Federal troops, but no open clash occurred. Tension continued, however, throughout September and October. In September, the president opened congress with a speech on the state of the nation, in which the keynote was that the administration intended to go forward firmly and fearlessly with its social and industrial reforms. He declared the results of the first half of his six-year term to have been: railway nationalization; bolstering of the nation's oil economy with steps toward nationalization of that industry; increased agricultural production as a result of the continuation of land divisions among the agrarian workers; and a gold reserve covering almost 40% of the outstanding banknotes. In November, Cárdenas gained judicial support for his land-division program when the courts declined to judge the constitutionality of his land decrees and refused an injunction to curtail further land expropriations. In December, Cárdenas changed the name of the National Revolutionary party

WORLD PRODUCTION OF SILVER in 1937 (276,000,000 fine ounces), showing part contributed by Mexico, the leading producing country

to "National Party of Workers and Soldiers," and ordered that Government employees no longer be required to make contributions to the party funds. These moves were to make the party one of the people rather than of Government employees.

The Church problem passed 1937 without violence except in some States where local persecutions were continued. The controversy had become one of State instead of Federal attacks on the Church, and the

president himself adopted a conciliatory policy toward religion. The Easter message of Pope Pius XI did not, as in the past, condemn Mexico's Government as being tyrannical; instead he followed a policy of hopeful moderation by appointing, in March, a friend of Cárdenas, Luis María Martínez y Rodríguez, as archbishop of Mexico. Government restrictions on the Church were lifted for the installation ceremony of the new archbishop in April. In June Cárdenas unexpectedly moved to nationalize the consolidated railways and run them for public service instead of private profit. A department of railways was created to administer them.

Outstanding among Cárdenas' activities was a land policy of expropriation and distribution of land among the peasants. The most important of these measures was the expropriation of the henequen plantations of Yucatan in the summer. In keeping with the agrarian reform program, these vast estates were divided among the peasants and ordered organized into communal holdings. In Sonora foreign interest was affected by land appropriation and distribution as they had been in the Laguna region of Durango and Coahuila in August 1936. These actions were in conformity with provisions of the Constitution of 1917, making large estates liable to partition and distribution among the country's peasant population. During President Cárdenas first three years ending in 1937, 5,000,000ac., more than all the land distributed during the two previous decades, were expropriated for the benefit of more than 500,000 landless peasants. Large landholders still retained over 150,000ac., or three times as much as that cultivated by the newly-landed peasants. Approximately 2,500,000 peasants were still without land. The redistributed land was placed in the hands of separate co-operative units closely associated through the National bank of Ejido Credit, the Government's chief agent in this project, and thus formed a huge collective farm. The functions of the Ejido Credit bank, founded in 1936, are to finance the peasants, advise them on planting, and supervise marketing operations.

The petroleum problem, relatively quiescent since 1928, became active again during 1937 with crises in May and June and in the closing weeks of the year. Late in May, 18,000 members of the Mexican Syndicate of Petroleum Workers struck against 17 foreign-owned oil companies, paralyzing the nation's \$500,000,000 petroleum industry. The strike was lifted only after President Cárdenas persuaded the workers to submit their demands to a Federal conciliation board. In August a special commission ordered wages increased to a 4.90 peso minimum, and a maximum 40-hour week, with a provision for a mixed commission of labour, company, and Government representatives to adjudicate future disputes. The entire year was marked by a bolstering of the nation's oil economy with steps suggesting nationalization of that industry, through the encouragement and support given petroleum labour strikes, the nationalization of millions of acres of foreign

oil lands, and the imposition of drastic limitations on the foreign companies in Mexico. The Government's avowed intention was to throw off the yoke which British and United States oil imperialism had maintained in a stranglehold on Mexico's petroleum economy since the days of Porfirio Díaz. Thus, at the expense of foreign capital and management, the huge profits from that industry were to be deflected from foreign capital to Mexican labour.

On December 18 salaries of Mexican petroleum workers were ordered increased by about one-third, thus creating a privileged class in the ranks of Mexican labour and setting a yardstick by which the Federal Government hoped to develop further its campaign to create a larger middle class in Mexico. This affected chiefly the large British and North American companies, and the latter protested their inability to pay the wage increases. The Labor Board replied that confiscation of property would then be resorted to in order to meet the 1,500,000-pesos strike wages. As the year closed, discussions had failed to disclose a solution acceptable to the foreign companies. Increased costs involved in making the award effective, it was asserted, would add so greatly to the cost of producing and refining oil as to lose all foreign markets to Mexico's supply. Their only hope as the year closed was to obtain a Supreme Court injunction to prevent the decision of the Labor Board from becoming effective on Jan. 3, 1938. An additional complication of the oil problem arose from differences between the status of British and North American companies, with the former agreeing to pay 15 to 35% royalties to the Government in return for the privilege of developing the new Pozarica field, regarded as one of the richest in the world. This arrangement, it was prophesied, would bring a shift of Mexican oil trade to Great Britain at the expense of the United States.

During the year Mexican foreign relations were generally friendly, despite the Government's strong anti-foreign oil policy. The Government expressed itself frankly in favour of the loyalist Government of Spain as the legitimate Government, and received and aided Spanish war orphans. Mexico continued to be a centre for political exiles from all parts of America. On December 21, ratifications were exchanged with the United States for the nullification of article 8 of the Gadsden Treaty of 1853, under which that country held rights which technically infringed upon the sovereignty of Mexico.

**Trade and Communication.**—Mexico's external communications are by steamship service, especially through Vera Cruz, by three main railways to the United States, and one to Guatemala; by increasingly important air transport routes north and south and to the West Indies; and by highway, notably through Nuevo Laredo. There are over 15,000 mi. of railways. Construction of 1,612 kms. of additional railway in four main projects, at an estimated cost of 150,000,000 pesos, was continued during 1937. Completion of all was planned by 1941, with current construction on schedule. Highway construction, under the Six-Year Plan, promises to revolutionize Mexican internal communications and materially affect the national economic life. The main arteries are: the 1,050 mi. Nuevo Laredo-Acapulco highway, opened in 1936, and the 2,700 mi. Nogales-Chiapas highway, a link of the Pan-American highway, whose construction was begun in 1937, with completion at a total cost of 240,000,000 pesos promised by the end of 1938. The national gasoline tax, yielding 31,306,925 pesos in 1936, is devoted exclusively to highway development. In July 1937 tentative plans were announced for construction of five cargo vessels for the development of trade on the west coast. Opening of new airways under Government subsidy is being pushed.

In 1936 exports totalled 775,313,330 pesos, of which mineral

products, principally petroleum, silver, gold, and lead, constituted 49%, with a further 25.75% in gold and silver bullion. In the first half of 1937 exports increased in value 5%. The principal customer is the United States, taking approximately 60% annually, with Great Britain second. In 1936 imports totalled 464,142,705 pesos, with machinery, automobiles, and other manufactured goods the principal commodities. In the first five months of 1937 imports increased 38%. The United States supplies over 60% of the imports. The relative increase in imports was officially ascribed to heavy purchases of machinery, \$38,000,000 for Government account alone in the first nine months of the year.

**Agriculture and Mining.**—Resources are mineral and agricultural. A leading world petroleum producer, Mexico's 1936 oil output was 40,400,000 barrels. In the first eight months of 1937 it was 30,250,000 bbls., a 15% increase for that period, but strikes caused a material decline in the latter part of the year. Mexico is also a leading producer of silver, as well as gold, copper, lead, zinc, and other minerals.

As the principal crop, corn, is the country's chief food source, Mexico is almost agriculturally self-sufficient. Cotton has recently come to the fore. Important exports are coffee, henequen, bananas, and chickpeas. In 1930 there were 10,082,958 head of cattle, mainly in the northern States.

A further resource, the tourist trade, increased materially in 1937 over 1936 when 99,570 tourists spent \$14,838,142.

**Banking and Finance.**—The monetary unit is the peso (value: 27.8¢ U.S.). The budget for 1937 was for 333,220,689 pesos (287,198,785 pesos in 1936), with receipts estimated at 330,613,642 pesos. Actual receipts for the first eight months of 1937 were 33% in excess of estimates.

**Education.**—Urban education is supported by the States with total 1937 budgets of 21,994,839 pesos, 17% more than in 1934; rural education, by the national Government. In 1936, 10,199 rural schools, with 14,523 teachers and 647,127 students, cost 23,696,029 pesos, a heavy increase over 1934, when there were over 8,165 schools, 10,233 teachers, and 582,820 students, maintained at a cost of 12,371,914 pesos.

**Army and Navy.**—The army and navy personnel numbers 49,485. The navy includes four gunboats and 25 other vessels. The 1937 budget provided 80,285,165 pesos for army and navy.

(L. W. BE.)

**Mexico City,** capital of Mexico, in the valley of Mexico on the south central plateau. The area is 15 sq. mi.; population (official estimate, 1935) 1,029,068. The Government of the city is controlled by the Federal Government through the governor of the Federal district. The city in recent years has expanded, absorbing the adjacent cities Tacubaya, Mixcoac, and Tacuba. A \$5,000,000 municipal waterworks system utilizes mountain springs for an abundant fresh water supply. Mexico City and its immediate vicinity abound with historic sights which attracted over 100,000 tourists in 1937. Touring has increased tremendously since the completion, in 1936, of the Nuevo Laredo highway from the United States border. Building permits during 1937 showed a notable increase over the preceding year both in number and volume.

(L. W. BE.)

**Mica.** For any satisfactory consideration of the subject of mica, it must clearly be understood whether sheet mica or scrap mica is under discussion, for the uses of the two types are almost as distinct from each other as if two different minerals were involved. For example, statistics show a production of 19,600 metric tons of mica in the United States in 1936, 9,000 tons in India, a similar amount in the Soviet Union, 640 tons in Canada, 500 tons in South Africa, 450 tons in Madagascar, and

smaller amounts in other countries, totalling some 40,000 tons. Analysis of these figures shows that only 600 tons of the United States output is sheet mica, and the remainder scrap, while the Indian and Madagascan outputs are predominantly sheet, although they contain a small undetermined amount of scrap; Canadian production contains about 10% sheet, and the Russian, while highly uncertain, is probably well under that amount; the South African figure includes only a few hundred pounds of sheet, but most of the smaller producers ship nothing but sheet material. All told, then, on the average sheet mica constitutes about 25% of the total, and scrap 75%. The chief use of sheet mica is in electrical insulation, with small amounts for stove glazing, phonograph disks, lamp chimneys, etc. Scrap mica is ground and goes mainly to the roofing industry, with smaller amounts to wall-paper, paints and rubber.

Industrial recovery and rearmament programs have made an active demand for mica, and the outputs of all the leading producers have recovered to beyond the pre-depression level, except Canada and the sheet output of the United States. India has shown a particularly strong recovery, with a 1936 output nearly four times the 1932 low, and a half greater than the 1929 high. Canada, however, has had a continued decline to a 1935 output only 15% of the 1929 high, with little recovery in 1936. Demand for scrap mica in the United States had practically no depression drop, and now stands at better than three times the 1929 figure, but sheet mica in 1932 was only one-sixth of the 1929 output, and was still one-third below 1929 in 1936. (G. A. Ro.)

**Michigan**, twenty-sixth State to become a member of the United States, popularly known as the "Wolverine State"; area, 57,480 sq.mi. (exclusive of 40,000 sq.mi. of Great Lakes' water surface within her boundaries); population (U.S. census, 1930) 4,842,325; (estimate Jan. 1, 1938) 5,293,000. Capital, Lansing, 78,397. Larger cities are Detroit, 1,568,662; Grand Rapids, 168,592; Flint, 156,492; Saginaw, 80,715. Of the State's population, 3,302,075 are urban, or 68.2%; 4,650,171 whites; 192,154 coloured; of the whites, 3,809,903 native born, 840,268 foreign born; about 350,000 of the total population live in the 15 cities of the upper peninsula, which comprises about one-fourth of the State's area.

**History.**—The year 1937, during which Michigan began her 101st year as a member of the Union, proved to be a peculiarly eventful one. Upon Frank Murphy, who, returning to the State after four years as governor general of the Philippine Islands, had defeated Governor Frank D. Fitzgerald for re-election in November 1936, fell the responsibility of formulating a policy for meeting the most serious industrial crisis which ever confronted the State. Only a few days after his inauguration as governor on January 1, the first large-scale sit-down strike in the United States was undertaken in the Flint plant of the Fisher Body Co., a subsidiary of the General Motors Corporation. It rapidly spread to other General Motors units. Except when rioting in Flint on January 11 prompted him to send the National Guard there, Murphy followed a policy of non-interference with the sit-down. When it appeared that he might be able to negotiate

an agreement in the General Motors strike, he requested Genesee county officers to delay the enforcement of a court order that sit-down strikers must leave the plants. The ensuing negotiations, with Governor Murphy as mediator, ended the General Motors strike 44 days after it was begun, and 140,000 employees returned to work. Strikes which broke out in March in other large automobile plants in the State were similarly settled in April, but in the meantime the movement had begun to spread to other industries, to hotels, stores and business establishments of all kinds. Rapid strides were made in the unionization of industry. In June a "labour holiday" in Lansing, an unauthorized power strike in the Saginaw valley, and C.I.O. reverses in Monroe tended to check the sit-down movement. The achievements of the C.I.O. organizers were illustrated in the fall elections in Detroit when the C.I.O. candidate, Patrick H. O'Brien, won second place in the mayoralty primary, despite the vigorous opposition of the three Detroit dailies. In the November election, however, O'Brien was decisively defeated by Richard W. Reading. The summer months witnessed an intensive struggle between C.I.O. organizers and the Ford Motor Co.; at the end of the year the latter was in sharp conflict with the National Labor Relations Board. The most striking fact in the history of 1937 labour struggles in Michigan was the absence of bloodshed.

The accomplishments of the State legislature which convened in January were considerable. A majority of the 100 members of the House of Representatives belonged to the Democratic party. The 32 members of the senate were closely divided along party lines; a conservative-liberal division within each party group so modified the alignment with respect to particular measures that the resulting legislation was frequently non-partisan in character. Among the more significant enactments were laws placing the entire State Government under the Civil Service; requiring applicants for marriage licenses to furnish certificates of freedom from venereal diseases; raising the standards for applicants to practice healing; effecting the consolidation under a single executive of prisons, probation, and parole activities; consolidating the administration of the various State institutions for the mentally ill; establishing the secret primary; making more effective collections under the sales tax; revising the State banking laws. The legislature also liberalized requirements for old age assistance. The administration was disappointed in the legislature's failure to pass a rural electrification measure, and in its neglect to adopt a labour relations measure to which the governor could give his approval. The legislature embarrassed the governor by appropriating \$18,000,000 more than estimated income; however, drastic cuts by the governor brought the budget within \$3,000,000 of balancing at \$107,000,000.

Such factors as the regular alternation in control by the two major parties in the four previous biennial November elections, the contributory effect of the Roosevelt landslide in the Democratic victory in the State in November 1936, and the potential political results of Governor Murphy's policy with respect to sit-down strikes, intensified the interest of political observers in the spring election of 1937. The Democrats made material gains: Edmund C. Shields and John D. Lynch were elected regents of the University of Michigan; Mrs. Lavina Masselink and James K. Jakway, chosen as members of the State board of agriculture, made that body for the first time in 40 years predominantly Democratic; Thomas F. McAllister was elected Justice of the Supreme Court; and Murray D. Van Wagoner, State highway commissioner. Republicans elected were: Walter H. North, Justice of the Supreme Court; Eugene B. Elliott, State superintendent of public instruction; Frank Cody, member of the State board of education.

Governor Murphy's appointments to important office attracted much attention by reason of being frequently non-partisan in char-

FRANK MURPHY, governor of Michigan

acter. Charles T. Fisher, Jr. was made State banking commissioner; upon his resignation at the end of the year, he was succeeded by Alvan Macauley, Jr. Richard T. Frankenstein, prominent labour organizer, was appointed a member of the Emergency Relief Commission. The appointment of John N. Fegan, Democrat, to succeed Melville B. McPherson, Republican, in the chairmanship of the State tax commission, provoked the latter to challenge the governor's power to designate who should serve as chairman of the commission—a dispute accentuated in importance by the fact that the governor had recently appointed a tax reform study commission.

**Education.**—In the field of education, the total State aid for schools was increased to \$40,200,000. Retirement fund benefits to teachers were increased from a maximum of \$500 per teacher to a maximum of \$1,200, the State for the first time contributing a portion of the income of the fund. Considerable demand was evidenced for a constitutional amendment making the office of superintendent of public instruction appointive rather than elective.

**Banking.**—The State banking department had under its supervision in 1937 some 365 State banks, seven industrial banks, 140 credit unions, and 175 small loan licensees—institutions having resources in excess of \$800,000,000. In its supervision of the liquidation of some 225 projects, the department speeded up the process, and placed particular attention on the collection of stockholders' assessments. At the close of the year exact figures respecting business progress were not available. In 1935, 5,592 manufacturing concerns produced goods valued at \$4,020,909,490, with motor vehicles and parts reaching \$2,263,088,259. Sales tax collections, totalling \$57,936,450, were more than 15% in excess of those of 1936. Reports on the tourist business, ranked as the second most important in the State, indicated a 15% increase over 1936, and placed Michigan income from this source at about 8% of the total for the nation. One of the most significant developments in the agricultural areas was the process of rural electrification, which in spite of the failure to obtain State sponsorship, was extended by some 4,000 miles of lines. The national unemployment census statistics published at the close of the year gave Michigan, which is seventh in population rank, as ninth among the States in the number of jobless. At about the same time an optimistic note was sounded by the announcement of several of the large automobile plants of a considerable increase in re-employment in the near future.

**Agriculture and Mining.**—In 1935 Michigan had farms covering 18,459,922 ac. with crops valued at \$70,597,000 and livestock items at \$115,023,000. Mineral production for the same year was \$77,149,256, led by iron ore (\$20,788,153) and petroleum (\$16,350,000). (L. G. V. V.)

**Michigan, University of.** The year 1937 was of special significance to the University of Michigan since it marked the completion of the university's first century following the first meeting of the board of regents held in June 1837, in Ann Arbor. This event was commemorated by a five-day celebration held in June 1937. The program included not only a survey of the university's past but a consideration of its future obligations and responsibilities in the modern social organization. With one or two exceptions, the 25 speakers were numbered among the 85,000 graduates of the university, since it was felt that their familiarity with the practical problems of the contemporary world, combined with their knowledge of the university, would give their mature judgment a special significance. The celebration was, in a unique sense, a family affair. During the past year Michigan has also undertaken, in a practical way, to emphasize its obligations to society through the formulation

of a project for educational centres throughout the State, to be maintained jointly by local groups and representatives of the faculties, as a further development of its programs in extension alumni education, and post-graduate medical courses. Thus, it is planned to develop short courses in such fields as seem indicated by local conditions, not for college credits but to furnish information for those who seek guidance in their problems. (A. G. R.)

**Microphotography:** *see* LIBRARIES; PHOTOGRAPHY: *Documentary Films*.

**Midway Islands,** a group of two small islands and several sand islets in lat. 28° 13' N., and long 177° 23' W., 1,149 miles N.W. of Honolulu, belonging to the United States of America. The larger is Sand island; about 85 acres; maximum height above sea level, 43 feet. The other is Eastern island; about 328 acres and very low. There are no native or permanent inhabitants.

They were discovered on July 5, 1859, by Captain N. C. Brooks, of the American-owned Hawaiian bark, "Gambier," who took possession in the name of the United States. Captain Reynolds, in the "U.S.S. Lackawanna," took possession formally on Aug. 28, 1867. In 1903 the islands were made a naval reservation, and they have been under the jurisdiction of the U.S. Navy Department since. Sand island is the site of a commercial cable station and the Navy Department has granted Pan-American Airways permission to establish temporary commercial air service facilities on that island in connection with its trans-Pacific airline operations. Both islands are little more than sand dunes and are non-productive. (O. M. H.)

**Milk.** Among developments that focused the attention of United States milk producers and distributors in 1937 were: 1. Variable and rising transportation costs. 2. Recurring price struggles. 3. The widening spread between fresh and evaporated milk prices. 4. The increasing volume of milk sold in store. 5. A movement toward consumer co-operative buying. 6. Increase in the use of paper containers. In the United Kingdom 1937 marked the issuance of a white paper which proposed that the Milk Commission insure the price of milk to British producers in order to maintain a milk supply for the manufacture of butter, cheese and other milk products. Milk production was downwar in England during 1937, especially for manufacturing purposes and in the autumn prices for the ensuing 12 months were raised from 15s. 3d. to 15s. 11d. per 12 gallons.

About half the U.S. milk supply is produced in one-third of the year, the seasons when cows freshen. This condition, plus large producing capacity and restrictions on moving milk from one region to another, makes for unevenness in markets and prices and leads to recurring disagreements and milk strikes. Probably outstanding in the industry's 1937 disturbances were those in New York where a new organization, the Dairy Farmers Union, headed a movement of producers to obtain higher prices.

In New York city there was a decided increase in the volume of milk sold in grocery stores, as against delivered milk, and movement toward consumer co-operatives to reduce prices. The State of New York appropriated \$50,000 to employ an accounting firm to investigate the costs and profits of milk dealers of whom there are about 4,000 licenced in the State. The State audit is to be reported early in 1938.

Transportation costs and the heavy expense of unnecessary duplication of trucks both in picking up milk in the country and subsequently delivering it in the city were subjects of renewed agitation among dairy co-operatives. Improvements in processing methods have enabled tinned milk to be sold at gradually decreasing prices, while fresh milk tends to increase in market price. Although milk is marketed in 676 cities under standard ordinances modelled on recommendations of the U.S. Public Health Service, there is an absence of uniformity of laws governing interstate trade in milk and many cities restrict their milk supply to a milk shed or area within fifty miles or so of the city, on the theory that milk from greater distances may not be kept fresh. This handicaps the movement of milk from surplus areas.

The National Co-operative Milk Producers Federation, which represents 350,000 dairy farmers, held its 21st annual convention in Baltimore, Maryland, Nov. 1-2, 1937. (See BUTTER; CHEESE; DAIRYING; MARKETING BOARDS.) (S. O. R.)

**Miller-Tydings Act:** see ADVERTISING: Legislation.

**Mills, Ogden Livingston** (1884-1937), a Republican party leader and former secretary of the treasury, was an active figure in American politics from 1910 to 1933. Born, Aug. 23, 1884, of wealthy Newport, R.I., parents, he received his bachelor and legal degrees from Harvard University in 1904 and 1907. As early as 1910, he was chosen treasurer of the Republican County Committee of New York County. He was nominated for the national House of Representatives in 1912, but was defeated because of the split in the Republican party. In 1914, however, he was elected to the State Senate where he fought to liberalize the party. After serving in France for 19 months, he became a member of the U.S. House of Representatives, and in 1926 was defeated by Alfred E. Smith in a contest for governor of New York. The next year, however, he was appointed assistant secretary of the treasury, a post which he held until he became full secretary in Feb. 1932. With the close of the Hoover administration in March 1933, he retired from active participation in party affairs but he continued to urge reforms and was occasionally mentioned as a possible presidential candidate. His death occurred in New York City, Oct. 11, 1937.

**Mineralogy.** In noteworthy articles during 1937, Bayley discussed mineralogy's contribution to science and industry (*American Mineralogist*, May) and Winchell reported on his zeolite researches (*ibid.*, February). A significant study of silicosis was made by Emmons and Wilcox (*ibid.*, April). In three papers the classification of natural silicates was treated (*ibid.*, May, Berman; November and December, Swartz). Gratton de-

scribed recently developed technique in mineralography, while the accessory minerals of igneous rocks were studied by Taylor (both *ibid.*, May). Tilley discussed the paragenesis of kyanite-amphibolites, and Anderson and Payne described the magnesium-zinc-spinels of Ceylon (both *Mineralogical Magazine*, September). Spencer reviewed the tecktite problem (*ibid.*, March).

The special May number of the *American Mineralogist* was of unusual interest and size. It included 35 articles totalling 435 pages, and was dedicated to Professor Charles Palache by his friends and former students. Professor Palache has been a member of the Department of Mineralogy of Harvard university for over 40 years. He is a past president of the Mineralogical and Geological Societies of America.

**Gem Minerals.**—Interest in authoritative information about gem stones was continued by wholesale and retail gem dealers. Several regional meetings were held under the direction of Mr. Robert M. Shipley of Los Angeles, Calif. Important texts, methods, and apparatus of service in the determination of gems were demonstrated. Through the recent publication in Great Britain, Germany, and the United States of books on gems, adapted to the general reader, public interest has been aroused. Steady growth of the amateur lapidary movement is also to be noted.

Blue zircon, often called the "gem of mystery," continues its popular appeal. Its occurrence, physical and optical properties, and methods of heat treatment were discussed by Anderson, Chudoba, and Payne (*Gemmologist*, London); and by Eppler, Brauns, and Wild (*Deutsche Goldschmiede Zeitung*). Eppler also submitted data on the ideal cutting of aquamarine and other varieties of beryl, of tourmaline, and of citrine or yellow quartz, erroneously called "topaz" in the trade (*ibid.*). He believes that stones cut according to his directions possess greater brilliancy. (See also GEMS AND PRECIOUS STONES.)

**Roebling Medal.**—A significant event in American mineralogy was the first award of the Roebling Medal of the Mineralogical Society of America to Professor Charles Palache at Washington, D.C., Dec. 29.

**Necrology.**—Three widely recognized leaders in mineralogical science died in 1937. Alexander H. Phillips died on Jan. 20 at the age of 71. For 49 years he was a member of the faculty of Princeton university. In 1931 he was president of the Mineralogical Society of America. On Jan. 28, Reinhard Brauns of the University of Bonn, Germany, died at the age of 75. He was noted for his many articles on the optical character of crystals, on gems, and on the rocks and minerals of the volcanic areas of the Rhineland and Laacher See District. On Dec. 12, Arthur Hutchinson, formerly Professor of Mineralogy at Cambridge university, England, died at the age of 71. He was a past president (1921-24) of the Mineralogical Society of Great Britain.

**Minnesota,** a north central State of the United States popularly known as the "Gopher State," has an area of 84,682 sq.mi., of which 3,824 are water. Population, U.S. census of 1930, 2,563,953, estimated July 1, 1937, 2,652,000. Capital, St. Paul, 271,606. The only city in the State with a larger population was Minneapolis, 464,356. Duluth had 101,463. Of the State's population 1,257,616, or 49% were urban. There were 2,538,973 whites, 9,445 coloured, 2,150,697 native-born, and 388,294 foreign-born.

**History.**—Minnesota business, bolstered by considerable gains

MINERAL PRODUCTION in the United States: Federal Reserve Board index, without adjustment for seasonal variation

in the first half of 1937, finished the year with net advances of 5 to 15% over 1936. Among the most marked gains were those in farm machinery, implements, and tractors. Good crops over much of the State yielded a farm income materially above that of the previous year, but because of the rise of prices the purchasing power of Minnesota farmers remained about the same. Labour history in 1937 was marked by strikes and violence. Major labour disputes included truck drivers, laundry workers, five and ten cent stores, mail order houses, hotel workers, brick makers, and automobile salesmen. A timber workers' strike caused a prolonged disturbance in northern Minnesota. A growing friction between A.F. of L. and C.I.O. unions was marked by the ousting of the C.I.O. unions from the central labour councils.

ELMER BENSON, governor of Minnesota

Officers of the State were Governor, Elmer A. Benson; secretary of State, Mike Holm; treasurer, C. A. Halvorson; auditor, Stafford King; attorney-general, William S. Ervin; commissioner of education, John G. Rockwell; chief justice, Henry M. Gallagher.

In the legislative session of 1937 the Farmer-Labor party attempted to fulfill its mandate from the 1936 elections. Governor Benson, inaugurated Jan. 5, proposed reforms in education, taxation, conservation, labour, and other fields. Clashes between a conservative Senate and a Farmer-Labor House impeded action. A deadlock on tax measures prolonged the session a week beyond the legal deadline, and a special session was called after efforts to break the deadlock had failed. Out of the regular and special sessions emerged a dozen tax bills effecting increases in virtually all taxes save the property tax. Other legislation included acts establishing county welfare boards; creating a State geographic board; amending the Workmen's Compensation Law to require all employers to carry compensation insurance; eliminating State levies on homesteads; extending highway traffic regulation; and authorizing cities and villages to acquire recreational facilities and to operate programs of public recreation. A thoroughgoing study of State and local government, made under gubernatorial authority, eventuated in a detailed report in the nature of a State finance and tax survey by Harry Fiterman and a demand by the governor for elimination of overlapping activities, for reorganization, and for economy.

**Education.**—Minnesota school enrolment for 1936–37 was 530,485 pupils, 22,046 teachers; total public school expenditure, \$48,169,809. The State has an illiteracy rate of 1.3%. The University of Minnesota had a total enrolment of 32,369, with a regular enrolment of 16,277 students, in 1937. A dozen or more denominational colleges were active, many of them with increasing enrolments.

**Charities and Correction.**—The State Board of Control,

created in 1901, is composed of three six-year appointees. In 1937 it had general control over 19 State institutions and supervision of 14 tuberculosis sanatoria. The total number of inmates in the State institutions was 17,463 in 1936.

**Banking and Finance.**—On June 30, 1937, there were 68 banks (196 of them national banks) with deposits of \$941,542,221 and resources of \$1,046,784,366. Taxable valuation of real and personal property in the fiscal year ending June 30, 1937, was \$1,371,980,515. Moneys and credits were \$656,890,258. The net State debt on June 30, 1937, was \$134,155,893.

**Agriculture, Manufactures.**—In 1936 Minnesota had 181,235 farms, with a total area of 30,238,648 acres. The total value of all farm property in 1936 was \$249,181,000; the gross income from crops, \$83,006,000; and from live stock, \$222,750,000. Measured by total gross farm income, Minnesota ranked seventh among the States. It led in production of butter, with 272,585,000 lbs. in 1936; in barley, with 31,620,000 bu.; in rye, with 4,325,000 bu.; and in flaxseed, with 4,235,000 bushels. It was third in production of oats, with 94,376,000 bu.; and fifth in corn, with 88,331,000 bushels.

The 1935 Federal census of business reported 3,738 manufacturing establishments in Minnesota, employing 81,600 wage earners who earned \$84,720,942. Fourteen meat-packing establishments reached a production valued at \$150,969,114; 74 flour and grain mills, \$101,129,180; and 836 dairies, \$80,158,458. Iron ore production in 1936 amounted to 33,781,763 tons. Flour production in 1936 was 12,726,000 barrels.

(T. C. B.)

**Minnesota, University of.** The university on the basis of enrolment ranks third among American universities. In 1936–37 it had an aggregate of 34,377 students of which 20,024 were candidates for degrees—a growth of 9.3% over the corresponding number of degree students in 1935–36. The legislature in 1937 increased the university appropriation for general maintenance from \$3,100,000 during each year of the biennium 1934–36 to \$3,500,000 for each year of the biennium 1937–39, thus permitting full restoration of all salaries and providing additions to staff. Legislative funds were also appropriated for a new school of forestry building, a business administration unit in a new social science building, and to furnish and operate a previously constructed psychopathic unit of the university hospitals.

Educational and research programs in the Institute of Technology have been advanced through construction and opening of hydraulics laboratory at the head of St. Anthony falls at Minneapolis, and by the acquisition of additional space for work in experimental engineering. Because the university was designated by the United States Public Health Service as a regional public health training centre, work in this field has been greatly expanded. Grants from major foundations have been received to support a five-year program in training for public service; for a three-year study of the needs, abilities, and characteristics of late adolescents in relation to education of the type developed by the university's general college; for an evaluation of the general college program; for special research in biology and medicine; for research in art education; and for other purposes.

(L. D. C.)

**Minorities.** There was little improvement in the lot of national minorities in 1937. The growth of extreme nationalism, accompanied by a tendency to abandon the forms of democracy in favour of authoritarian forms of government, weighed heavily upon them; and there were few countries in which their members were not regarded and treated as second class citizens. "National solidarity" was an all too common aim

which meant, not winning the loyalty of all citizens by liberal treatment, but strengthening the ruling majority at the expense of the subject minorities.

The chief minority problem of 1937 was undoubtedly that of the Germans in Czechoslovakia (*q.v.*) There the Sudeten Germans, or the 66% of them that were followers of Henlein, had been enjoying since 1935 the powerful support and sympathy of Germany. The intervention of the Reich, though it forced the Czechs to face the problem, also complicated it, since it converted a purely internal question into an international issue. The Sudeten Germans were thereby drawn into the game of power politics. Once Germany had taken up their cause, any concession which the Czechs might make seemed a concession to Naziism. Nevertheless, Czech statesmen have given proof of their anxiety to deal justly by the Sudeten Germans.

In February the Czechoslovak Government granted five out of seven demands presented to them by the "activist" German parties (who are anti-Nazi, belong to the Government Coalition, and represent one-third of the total German population). A wide agreement was drawn up embracing the general principles of minority treatment. The Czechs insisted that they were prepared to go to the limit of concessions that would not endanger the State. What they were not prepared to do was to grant the *Völkische* autonomy demanded by Henlein, which in their view would mean the disruption of Czechoslovakia. Some results have been achieved since February, but progress is necessarily slow, because the vital condition, a better psychological atmosphere, is still absent. Until the international situation improves, that condition is unlikely to be realized.

On July 15, the Geneva Convention, which in 1922 had established an international régime of supervision and arbitration in Upper Silesia, expired, and its valuable machinery of conciliation disappeared. For 15 years it had successfully performed a task of great difficulty, and must be accounted one of the positive successes of the League. In November Germany and Poland signed an agreement that guaranteed for their respective minorities a bare minimum of cultural and general rights. The rights so covered fell far short of those enjoyed by, for instance, the Sudeten Germans.

In September the Hungarian minority in Rumania presented a petition to the League against a circular which had been sent by the Rumanian minister of commerce to some 72 firms requiring them to replace a large proportion of their employees with full-blooded Rumanians. The petition achieved its object in as much as the Rumanian Government voluntarily withdrew the order.

Finally, all over eastern Europe, but especially in Poland and Rumania, the year was notable for recurrent manifestations of anti-Semitism. (D. S.)

**Minor League Baseball:** *see* BASEBALL: *The Minor Leagues.*

**Miquelon:** *see* ST. PIERRE AND MIQUELON.

**Missions:** *see* FOREIGN MISSIONS.

**Mississippi,** admitted as a State in 1817; popularly known as the "Bayou State"; area, 46,810 sq.mi.; population (U.S. census, 1930), 2,009,821; (estimate July 1, 1937), 2,023,000. Capital, Jackson, 48,282, largest city in the State. Of the State's population in 1930, 340,964 were urban, or 16.9%; 1,000,103 whites; 1,009,718 coloured; 1,999,429 native born; 145 foreign born.

**History.**—The State of Mississippi votes solidly the Democratic ticket. For the period 1936 to 1940 the principal officers of the State are governor, Hugh L. White; lieutenant-governor, B. Snider; secretary of State, Walker Wood; attorney general,

HUGH L. WHITE, governor of Mississippi

Greek L. Rice; State tax collector, James B. Gully; State treasurer, Newton James; superintendent of education, J. S. Vandiver; presiding officer of the State senate, Lieutenant-Governor J. B. Snider; presiding officer of the house of representatives of the State, Fielding L. Wright. The State senate has 49 members in addition to the presiding officer, the lieutenant-governor. The house of representatives has 139 members. In the membership of the State legislature farmers predominate with a total of 89 in the two houses; lawyers, 51; teachers, 45; merchants, 14; insurance agents, 12; with 22 other occupations represented in the membership with from nine to two members. All members of the legislature are members of the Democratic Party.

The State is comprised of 82 counties and each county is divided into five supervisors' districts or "beats." The units of local government for practically all purposes of the State are the counties and the supervisors' districts. The term of all State and county officers is four years, there being only one exception and that the eight-year terms for which the six members of the State Supreme Court are elected.

**Education.**—The State maintains two systems of public schools, one for whites and one for coloured, as required by the constitution. Consolidation of rural schools has been very extensive in the past decade, the rural schools of all 82 counties of the State having been to some extent consolidated. In some instances as many as 50 small schools have been consolidated into five rural consolidated schools for the county, that is, one to each supervisor's district. The county is the public school unit.

The State maintains a system of higher education in which is found the University of Mississippi, at Oxford; Mississippi State college, at Starkville; Mississippi State college for women, at Columbus; Mississippi State teachers' college, at Hattiesburg; Delta State teachers' college, at Cleveland; and Alcorn agricultural and mechanical college, for negroes, at Rodney. All six of these institutions, the senior colleges of the State, are under the jurisdiction of a single board of trustees, with the governor as president of the board and a chairman of the board who is selected by the membership of the board. Ten boards and commissions, created under authority of law, give attention to public welfare activities.

**Banking.**—There are in the State 223 State banks, including 40 branch banks, and 26 national banks, including one branch bank. Bank resources stood at \$188,264,000 on June 30, 1936 with deposits at \$141,184,000.

MISSISSIPPI: Composition of population

**Agriculture, Manufactures, and Mining.**—Agriculture provided direct employment for 66.8% of the State's total population. Sixty-six per cent of the total land area of the State is used for agricultural purposes, there being 311,683 farms covering 19,655,413 ac. in 1935 with a crop output of

\$114,327,000, of which \$89,883,000 was cotton and \$14,797,000 was cottonseed.

Manufacturing in recent years has developed very rapidly, particularly manufacturing having to do with the use of cotton and the use of wood products. The output of 1,062 concerns in 1935 was valued at \$121,931,115. The State has great potential mineral resources, including clay products, oil and gas, cement, sand and gravel, glass sands, lime, building stone, and miscellaneous minerals. Production in 1935 (largely natural gas) was valued at \$3,092,609. (A. B. Bu.)

**Mississippi River System.** The Mississippi river rises in Lake Itasca, Minn., and flows in a general southerly direction 2,434 miles to the Gulf of Mexico. From Cape Girardeau, above Cairo, to the Gulf of Mexico, the river flows through the fertile lands of an alluvial plain, about 50 miles wide and 600 miles in length. Without levees, some 20,000,000 acres are subject to overflow by river floods which occur late in the crop season. The principal tributaries of the Mississippi are the Ohio, entering the river at Cairo, Ill.; the Missouri, entering above St. Louis, Mo.; the Arkansas and the White, entering the lower Mississippi above Arkansas City, Ark.; and the Red, which connects with the lower river in the vicinity of Angola, La. The basins of these tributaries, with that of the upper Mississippi, are the chief sources of flood waters of the lower Mississippi. The entire area drained by the system is about 1,240,000 square miles, equal to one-third the area of the United States.

*Divisions of the Mississippi Basin*

Designation	Area in square miles	Ratio to entire basin
Lower Mississippi basin . . . . .	69,000	0.06
Red River basin . . . . .	90,000	0.07
Arkansas basin . . . . .	186,300	0.15
Missouri basin . . . . .	527,100	0.43
Upper Mississippi basin . . . . .	165,900	0.13
Ohio basin . . . . .	201,700	0.16
Total . . . . .	1,240,000	1.00

**The Lower Mississippi.**—Works for the improvement of the channel have been executed at various places below Cairo and levees built for flood control from Rock Island, Ill., to near Head of Passes, La., 484 miles above to 1,070 miles below Cairo. Effective revetment below Cairo is now in place on 144 miles of river bank; and 35 miles of permeable dikes, with 10 miles of sand dikes for channel regulation, are complete. The 2,934-mile levee system, with earthwork aggregating 996,616,383 cu.yd., protects a total of 27,850 sq.mi. of land against maximum known floods. During 1937 there were 37,295,000 cu.yd. of material placed in the levees. The Bonnet Carre spillway structure, completed February 10, 1931, was operated for the first time during the flood season of 1937. The Birds Point-New Madrid Floodway was also brought into successful operation during the emergency. A navigable channel nine feet deep and 300 feet wide for a distance of 741 miles below Cairo, and a depth of not less than 35ft., several hundred feet wide, for the remaining 240 miles to the Gulf of Mexico is available.

**Basins of the Red and Arkansas Rivers.**—Six locks and dams on the Ouachita and Black rivers provide a depth of 6½ ft. at low water, a distance of 351 miles from the Red river to Camden, Ark. In addition, the principal streams are improved throughout a total length of more than 1,000 miles.

**Missouri River Basin.**—Although improvement of the Missouri river to date has secured 6-ft. navigation from the Mississippi to Kansas City and lesser depths upstream, the storage available

in the future from the Fort Peck reservoir is expected to furnish a desirable increase. The Fort Peck dam and reservoir are under construction with the main purpose of establishing 8- to 9-ft. navigation below Sioux City, Ia. The site of the dam is on the Missouri river, 11 miles above the confluence of Milk river, in Montana. The project stands 71% complete at the end of this fiscal year. The reservoir when complete will have a maximum storage capacity of 19,412,000 acre feet. The project will contribute an important share of protection in the control of flood waters.

**The Upper Mississippi.**—Below Alton, Ill., 9-foot channel depth is maintained by open river works. Above this point for the purpose of securing similar navigation depths, a system of low-head dams and locks is in process of construction. When complete, there will be 26 of these structures with a total lift of 331.3 ft. at low water in the 650 miles of river between Alton, Ill., and Minneapolis, Minn. Locks and dams Nos. 7 and 8 were opened to navigation this year. The 9-ft. canalization project, as a whole, is 67% complete, the extension authorized this year for the 9-ft. channel above St. Anthony falls, Minneapolis, not being included.

**The Ohio River Basin.**—The Ohio river has a total length of 981 miles. All of the structures of a nearly completed system of 47 locks and dams designed so as to have no adverse effect on flood control are in operation, thereby providing 9-ft. navigation throughout the length of the river. The fixed dam now under construction at Gallipolis, Ohio, will replace 3 existing dams.

**Flood Control.**—The general Flood Control Act of June 22, 1936, establishes, for the first time in the history of the Federal Government, a definite flood control policy which provides for Federal participation in the construction of economically justified projects in co-operation with States, political subdivisions thereof or other local interests. Improvements under construction include the Sardis dam, Yazoo River basin; the Conchas and Fort Supply dams in the Arkansas basin; the Fort Peck dam, on the Missouri river; the Tionesta and Crooked Creek dams in the Allegheny valley; and the Tygart River dam, West Virginia. The Muskingum valley system of 14 flood control reservoirs, situated in southeastern Ohio, is 81% complete.

**Expenditures.**—For the improvement of the Mississippi river and its tributaries, including the work completed during the fiscal year of 1937, a total expenditure of \$1,363,700,000 (£280,221,925) has been made. (See also FLOODS AND FLOOD CONTROL.)

**BIBLIOGRAPHY.**—*Annual Reports of the Chief of Engineers, U. S. Army* (1936, 1937); "The Work of the Mississippi River Commission," Col. C. W. Kutz, p. 697, *Transactions A.S.C.E.* (Vol. 93, 1929); "Canalization of the Upper Mississippi," Col. E. L. Daley, *Civil Engineering* (February 1936). (J. L. S.)

**Missouri**, popularly known as the "Show Me" State; area 69,420 sq.mi.; population according to the U. S. census of 1930, 3,629,367, estimated July 1, 1937, 3,989,000. Capital, Jefferson City, 21,596. The largest cities (1930) were St. Louis, 821,960, and Kansas City, 399,746. Of the State's population (1930) 1,859,119 were urban, or 51.2%; 3,398,887 whites; 230,480 coloured; 3,476,934 native born; 152,433 foreign born.

**History.**—Missouri, part of the Louisiana Purchase of 1803, became a State in 1821. The present constitution, adopted in 1875, provides for a general assembly, consisting of a Senate of 34 members elected for four years and a House of Representatives of 150 members chosen for two years. Principal executive officers are (1937): governor, Lloyd C. Stark; lieutenant-governor, Frank G. Harris; secretary of State, Dwight H. Brown; State auditor, Forrest Smith; State treasurer, R. W. Winn; attorney-general, Roy McKittrick; State superintendent of schools, Lloyd W. King. The judicial system consists of a Supreme Court, three Courts of Appeals, and 38 Circuit Courts.

Missouri's representation in Congress consists of two Democratic Senators (Bennett Champ Clark and Harry S. Truman) and 12 Democrats and one Republican in the House of Representatives. The presidential popular vote in 1936 was Roosevelt 1,111,043, Landon 697,891; none of the third parties polling as many as 15,000 votes. The vote for governor was Stark (Democrat) 1,037,133 and Barrett (Republican) 772,934. In the same election the voters defeated a State constitutional amendment to increase the pay of State legislators, but adopted amendments permitting the pensioning of firemen and school teachers and creating a State conservation commission to supervise wild-life restoration. The 1937 general assembly substituted lethal gas for hanging in capital crimes, prohibited the sale of goods manufactured by child labour, and increased the retail sales tax from one to two per cent.

**Education.**—The public school system consists of the University of Missouri at Columbia, five teachers colleges, a school of mines, Lincoln university for Negroes, 8,047 rural schools and 962 high school districts. Washington university and St. Louis university at St. Louis are the largest advanced private colleges in the State. In the school year 1935-36 there were 525,506 pupils and 18,009 teachers in the elementary schools and 171,735 pupils and 6,835 teachers in the high schools. The five teachers colleges had 12,579 students (1936) and the university 6,907 (1937). Total expenditures for operation of the public schools in 1933-34, \$29,379,927.

**Charities.**—In 1935 Missouri established old-age pensions for indigents past 70, payments not to exceed \$30 per month for individuals and \$45 for couples. Scarcity of revenue and excessive applications for aid have held the payments much lower, the average for Dec. 1937 being \$13.52. The 1937 session of the general assembly created a Social Security Commission to supervise such welfare activities as old-age pensions, child welfare, and relief in cases of public calamity. An Unemployment Compensation Commission was created to supervise an unemployment insurance program based on the pooled fund plan.

**Finance.**—The balance in the State Treasury on Jan. 1, 1936, was \$11,794,268.64; receipts for 1936, \$77,740,222.59; disbursements 1936, \$68,946,980.12; balance in State Treasury Jan. 1, 1937, \$20,587,511.11. The total bonded State debt on Dec. 31, 1937, was \$116,621,000. Expenditure for relief in 1937 was \$3,601,629.37. The assessed valuation of property in 1936 was \$3,795,634,668.

**Agriculture, Manufactures, Mineral Production.**—In 1936 Missouri had 198,709 farms with a total acreage of 35,053,297, of which 13,141,500 ac. were devoted to crops and 15,174,618 to pasture. The 1936 total value of farm crops was \$176,173,000, of which corn, cotton, oats, tame hay, and winter wheat made up 77.5%. In 1937 Missouri ranked 5th among the States in corn and oats, 8th in wheat, and 12th in tame hay and cotton. Total value of livestock in 1936 was \$259,545,300, making a total farm production of \$435,718,300. Cattle, sheep, horses, mules, and hogs make up the bulk of livestock production.

In the 1930 census Missouri ranked 10th among the States in

LLOYD C. STARK, governor of Missouri

manufacturing on the basis of number of establishments, 11th in value of products, and 13th in number of wage-earners. The State Department of Labor and Industrial Inspection report for the year ending Dec. 31, 1936, lists 4,406 manufacturing plants, 244,557 wage-earners drawing \$396,312,527, and an output of \$1,560,734,496. Motor vehicles, slaughtering and meat-packing, boots and shoes are important industries.

Missouri ranks between 10th and 15th among the States in mineral resources. Mineral production for 1935 was valued at \$35,800,213. The Bureau of Mines summary for 1935 indicates the chief minerals worked as:

Product	Amount	Value
Lead	97,493 tons	\$7,799,440
Coal	3,645,996 tons	6,924,000
Cement	3,291,332 bbls.	4,940,713
Stone	2,263,350 tons	2,695,352
Sand and Gravel	3,109,104 tons	1,889,787
Lime	312,462 tons	1,759,918

Missouri led the United States in lead production during 1936 with 110,428 tons out of a total of 373,986. (L. E. A.)

**Missouri River:** see MISSISSIPPI RIVER SYSTEM.

**Mohammedanism:** see ISLAM.

**Mola, General Emilio** (1887-1937), commander of the Northern Army and second in command to General Franco of the Insurgent forces in the Spanish Civil War, was killed in an aeroplane crash while flying over the northern front on June 3, 1937. General Mola was born in Cuba in 1887 and spent all his life in the army. In 1926 he was made chief of the colonial forces in Morocco and in 1931 was summoned to be Director-General of the Police of Spain. He soon resigned, however, due to the excitement following police firing upon a student demonstration. In 1935 a Rightist government returned him to his Moroccan post, but he was again dismissed in 1936 by a Leftist government. He was in virtual exile until he led the Insurgent troops into Spain from Morocco with General Franco.

**Molotov, Vyacheslav Mikhailovich** (1889- ), president of the Soviet Union Council of People's Commissars since 1930, and a member of the Politbureau (in which the real power resides), was born at Kazan, became a member of the Communist party in 1906, and by 1909 had been arrested and exiled. After much work as a Bolshevik journalist he played a prominent part in the October revolution, 1917, and became closely associated with Lenin; from 1920 to 1921 he was secretary of the Central Committee of the Party in the Ukraine, and from 1922 that of the same organ of the U.S.S.R., which holds complete legislative and executive power when the All Union Congress is not in session. Since holding high office, M. Molotov has always ranged himself on the side of moderation, and has been particularly vocal on behalf of international peace; it was he also who, in 1935, proposed, as the spokesman of the Council, the remodelling of the Constitution that came into effect at the close of 1937.

**Molybdenum.** The United States is the foremost producer of molybdenum, with about 80% of the world's recorded production to date, and a current output of about 88% of the total. Australia, Chosen, Japan, Spain and Sweden have contributed in the past, but are no longer active; Norway has long been a producer, but contributes only 4% of the current output, while Mexico, which first produced in 1932, now supplies 6%; Morocco, beginning in 1933, now adds another 1%, and various smaller producers the same amount, making a total of 8,800 metric

tons in 1936. An output of 2,200 tons in 1929 declined to 1,280 tons in 1932, but new developments in the applications of molybdenum in alloy steels and cast iron have resulted in a demand which has increased the 1932 low by nearly seven fold in four years. (See also MACHINERY AND MACHINE TOOLS.)

(G. A. Ro.)

**Monaco.** A small principality on the Mediterranean; area, c. 8 sq.mi.; population (1933) 22,153, of whom 1,750 were native Monacans. Its towns are Condamine (10,700), Monte Carlo (9,430), and Monaco (2,020).

Elections took place in July 1937. Lists of candidates presented by the Union Démocratique party, presided over by the mayor of Monaco, were elected in their entirety.

M. Émile Roblot, honorary prefect, was nominated on July 16, 1937, by His Highness the Prince of Monaco (Louis II; b. 1870; succeeded 1922) to succeed M. Bouilloux-Lafont in his duties as minister of State of the principality, that is to say, head of the government of Monaco.

**Monetary Units of Leading Countries:** see EXCHANGE RATES.

**Money, Purchasing Power of:** see PURCHASING POWER OF MONEY.

**Mongolia** (INNER AND OUTER), is a vast sparsely populated tableland occupying about 1,000,000 sq.mi. in North-eastern Asia. It is bounded on the north by Siberia, on the west by Chinese Turkestan, on the east by Manchoukuo, on the south by China Proper. Of the two component parts of Mongolia, Outer Mongolia (622,744 sq.mi.) is greater in extent; but Inner Mongolia (334,100 sq.mi.), understanding by that term the three Chinese provinces of Chahar, Suiyuan and Ningsia, is more thickly populated. The population of Outer Mongolia is usually estimated at 750,000-800,000, while there are about 1,500,000 Mongols in Inner Mongolia. Mongols constitute the majority of the population in those provinces of Manchoukuo which lie west of the Hsingan mountains and in the Soviet Republic of Buriat-Mongolia and some of them are to be found in Chinese Turkestan. They are mostly a nomadic and pastoral people, although in regions where they have mixed with the Chinese they show some tendency to adopt a settled agricultural life. Their unit of social organization is the tribe, or banner. Lamaism, a somewhat corrupted form of Buddhism, is the dominant religion; and Lamas, or priests, constitute a considerable part of the population. Most of the Lamas are attached to lamaseries, temples or monasteries which are among the largest Mongol communities. Although the peoples of Inner and Outer Mongolia are similar in race, language and habits, these two regions are separated by a long stretch of the Gobi desert and for almost two decades have been under quite different political influences. The history of the two should, therefore, be considered separately.

**History: Inner Mongolia.**—A feature of life in Inner Mongolia has been the rapid development of Chinese colonization, especially along the line of the Peiping-Suiyuan Railway. This led to much friction between the Chinese agriculturists, who wished to settle on the land, and the nomadic Mongols, who desired to keep large open spaces for the pasturing of their flocks and herds. There were occasional Mongol riots and revolts; but the Chinese officials, on the whole, maintained the upper hand until a new factor entered into the situation as a result of the creation of Manchoukuo. Japanese military influence began to spread from Manchoukuo into Inner Mongolia and the Japanese were quick to take advantage of the antagonism between the Mongols and the Chinese.

A so-called Mongolian Autonomous Political Council, with headquarters in Pailingmiao, came into existence under the leadership of Prince Teh, a Chahar Mongol. Prince Teh's policy was to hold the balance between Japan and China, endeavouring to obtain the maximum degree of Mongolian autonomy; but his hand was largely forced by the sweeping Japanese advance into North China in the summer of 1937. The Japanese had already obtained an adherent in Li Shou-hsin, a Manchoukuo Mongol who commanded an irregular force which had taken over several counties of Chahar in the winter of 1935-36. Mongol cavalry co-operated with the Japanese in their advance to Paotow, railhead of the Peiping-Suiyuan Railway. At the end of October an Autonomous Government of Mongolia was formed, headed by Prince Yun, a leader of the Suiyuan Mongols, with Prince Teh as vice-chief of State. The territory of the new State provisionally includes Suiyuan, and the northern part of Chahar. It is provided with Japanese military and political advisers.

**History: Outer Mongolia.**—The Republic of Outer Mongolia came into existence as a result of the invasion of this region by Soviet troops waging war against the White leader, Baron Ungern-Sternberg, who had made Outer Mongolia a base of operations. With this Soviet aid a group of Mongolian revolutionaries established themselves in power; and since 1921, when the so-called People's Revolutionary Government was established in Urga (now renamed Ulan Bator), the capital of Outer Mongolia, that territory has been in very close relations with the Soviet Union. Non-Soviet foreigners have been entirely barred from the country for the last few years and almost all recent information about it is based on Soviet sources. The régime in Outer Mongolia has been closely patterned on Soviet models, although with some allowance for the primitive economy and religious prejudices of the country. A pact providing for mutual assistance in the event of invasion was signed by the Soviet and Outer Mongolian Governments at Ulan Bator on March 12, 1936.

**BIBLIOGRAPHY:** H. H. Howorth, *History of the Mongols from the Ninth to the Nineteenth Century*; Henning Haslund, *Tents in Mongolia*; Owen Lattimore, *The Mongols of Manchoukuo*; *China Year Book*, 1936 (Chapter II). (W. H. CH.)

**Montana,** a State of the North-western United States popularly known as the "Treasure State"; area 146,572 sq.mi. making it the third largest State in the Union; population according to the U.S. census of 1930, 537,606, estimated by the Census Bureau July 1, 1937, 539,000. Capital, Helena, 11,800 which is fifth city in size in the State. Larger cities are Butte, 40,000, Great Falls, 29,000, Billings, 18,000 and Missoula, 15,000. Of the State's population in 1930, 181,036 or about 33% were urban; 517,327 were whites of whom 444,366 were native born; 14,798 were Indians. There were 216,479 gainful workers in 1930 of whom 79,518 were engaged in agriculture, 14,952 in mining, and 33,618 in manufacturing.

**History.**—What is now Montana was included in the territory of Idaho created in 1863. Montana territory was organized in 1864. The territorial period was dominated by mining, first of gold, then of silver, followed by copper which continues important to the present time. In 1889, Montana was admitted as a State. The Constitution which with amendments remains in force today is lengthy and contains much specific legislation. The amendments are mostly legislative rather than constitutional in character. The executive department is divided between several offices and administration in practice is handled by *ex officio* boards. Roy E. Ayers was elected governor in 1936, Sam Mitchell, secretary of State, and Harrison Freeborn, attorney-general. A law of 1937 has tended to centralize executive power in the governor. Legislative apportionment is based on counties, and this gives an

advantage to rural communities. The Populist movement with its demand for free silver was strong in the '90s. Recently, organized labour and the farmers' union have controlled the legislature.

**Education.**—The public school system has about 80,000 children enrolled in the grades, 27,000 in high school, and 4,000 in the six branches of the university. There are two other institutions of college grade in the State.

**Charities.**—Charities and relief are administered almost entirely by the State Board of Public Welfare and by Federal agencies. The State maintains institutions for orphans, blind, deaf, dumb, insane and for the tubercular. It also has reform schools for boys and girls, and a State penitentiary.

**Finance.**—The public debt of the State is \$14,000,000. The gross annual expenditures of State and subdivisions amount to \$40,000,000. State taxes are largely indirect, property taxes go to the counties.

**Agriculture, Mining, Manufacturing.**—Agriculture is the most important industry. Wheat production for 1937 was 27,000,000 bu., sugar beets 10,000,000 tons. There are 1,200,000 cattle in the State and 3,000,000 sheep. Mining statistics for 1935 reveal a total product valued at \$52,096,553 led by 154,957,470 lbs. of copper at \$12,861,470. Other minerals valued at over \$4,000,000 were silver, petroleum, natural gas, gold, zinc, and coal. Manufactures are largely milling, lumber, and smelting and had products valued at \$124,778,215 in 1935. The chief public problem is water conservation and irrigation.

**BIBLIOGRAPHY.**—Jordan, Harry J., *Montana's Production 1930-37*. Missoula, 1937. (P. C. P.)

**Monte Carlo:** see MONACO.

**Montreal,** in the Province of Quebec, Canada, is situated on an island at the confluence of the Ottawa and St. Lawrence rivers, approximately 1,000 mi. from the Atlantic ocean and 2,760 mi. from Liverpool. It is at the head of ocean navigation and the terminus of lake vessels. It is served by three canal systems, the St. Lawrence canals, 1,230 mi. to the Great Lakes, the Eastern United States canals, via the Richelieu river and Lake Champlain, 127 mi., and the Ottawa river canals, 119 miles. The head offices of the Canadian Pacific railway and of the Canadian National railways are situated at Montreal.

Population of the city of Montreal (Federal census, 1931), 160,925, and of greater Montreal, including its suburbs, 973,637. In 1936, as estimated by Lovell's *Directory*, the population was: city of Montreal 1,233,623, greater Montreal 1,406,596. Greater Montreal is governed by a Metropolitan commission, the majority of whose members are appointed by the city council of Montreal. The city council consists of 35 aldermen, of whom 5, selected by the council, comprise the executive committee. The mayor is elected by the city as a whole and is not a member of the executive committee.

Control of education is divided between the Catholic School Commission of Montreal and the Montreal Protestant Central School Board. The method of appointing members of the Cath-

ROY E. AYERS, governor of Montana

olic School Commission of Montreal was modified during 1937. A commission has been appointed by the Provincial Government to examine and report on the Protestant school situation.

The port of Montreal is the largest in Canada. The number of sea-going vessel arrivals in 1936 was 2,051. Net registered tonnage was 5,728,293; value of merchandise exported, \$208,605,108; and value of merchandise imported, \$151,608,469. For 1936 the amount of building permits issued stood at \$6,938,943; bank clearings at \$5,386,188,857; and bank deposits at \$10,150,016,770. The assessed value of real estate is \$1,238,995,256. (J. A. MA.)

**Montreux Convention:** see CAPITULATIONS.

**Mooney, Thomas J.:** see CALIFORNIA: *History*.

**More, Paul Elmer** (1864-1937), American critic and author, who in association with the late Irving Babbitt of Harvard university led the movement known as the New Humanism which glorified free-will and sought to re-establish a spirit of intellectual individualism. From 1921-33 he was lecturer in Greek philosophy and the history of Christian thought at Princeton university. His most recent works included *Christ, the Word* (1927), *The Demon of the Absolute* (1928), *The Catholic Faith* (1931), and *The Sceptical Approach to Religion* (1934). His death occurred at Princeton, N. J., March 9, 1937. For further information, see the *Encyclopædia Britannica*, vol. 15, p. 794.

**Mormons** (or LATTER DAY SAINTS). During the whole history of the Church of Jesus Christ of Latter Day Saints its members have been disciplined in the principle that the duty of the Church and its membership is to see that no member suffers from need for the necessities of life. The declared ideal of the Church is to make "every man equal according to his family, according to his circumstances and his wants and needs." Under Church law the first Sunday in every month is a fast day. Members are to give for the support of the Church poor and needy the food (or its price in money) that, not fasting, they would have eaten. Obedient to these principles, the Church has set up a Church Security Plan, to provide the necessities of life for needy members and to rehabilitate civically, morally, and spiritually those who have suffered during the depression. To rebuild thrift and self-respect, all employables receiving aid are to give some service therefore. Compensation paid to persons helped is based not upon a daily wage, but upon the daily need. A man with a family of five receives for his service what his family of five needs; a man without a family, doing the same work, receives only what he himself needs.

Effort is made to put the employables back into the industrial life of the country, both as employees and on their own account. Various work projects are established for the collection or production of food stuffs, clothing, fuel, shelter, for the beautification of Church property, and for the betterment of homes of the employables. Community projects are created and assisted. The second purpose of the plan is worked out by bringing the unemployed into local social and church activities and into the civic and cultural life of communities.

In 1937 there were 1,392 churches with a membership of 678,203; while the reorganized branch of the Church had 575 churches with 99,492 members. (J. R. CL.)

**Morocco.** The present article is concerned with the French zone only of this north-west African country. (See also SPANISH MOROCCO and TANGIER.) The reigning sultan, Sidi Mohammed (succ. 1927), is the nominal ruler, but the zone is effectively governed by the French resident general and com-

mander-in-chief, General Noguès. The area is c. 200,000 sq.mi., and the population 6,296,000. The normal French system of education is operated for both Europeans and natives, but the percentage of native illiterates is high. (X.)

**History.**—When General Noguès took over the position of resident-general in Oct. 1936 from M. Peyrouton, he found Morocco in the midst of a severe economic crisis resulting from the prolonged drought. The region south of the Atlas (the Sous) was particularly affected. Events in Spain naturally had a considerable repercussion in the French zone. The very fact that in a Spain that had been conquered by their ancestors, Moroccans were now fighting against European soldiers created a dangerous precedent.

General Noguès first adopted a series of measures to alleviate the distress of the natives and the pressure upon the small farmers. From Feb. 1937 onwards, reforms made themselves felt. The *Comité d'Action Marocaine* was dissolved (May 18) and several newspapers were suppressed. Nationalist and Communist agitators organized (Sept. 1) disturbances at Meknes, usually a very peaceable town (10 killed). At the end of October, serious disturbances took place at Fez, Casablanca, Marrakesh, and Oujda. Troops occupied the native town of Fez. The principal leaders were arrested and deported. These energetic measures re-established order.

On Oct. 29 there left Port Lyautey for the first time a vessel laden with 1,000 tons of crude oil.

The negotiations entered into with Great Britain for the suppression of the capitulatory régime in Morocco terminated in the agreement of July 29.

**Trade and Communications.**—Agriculture is the chief industry; and the principal minerals are phosphates, lead ore, and manganese. Imports and exports for 1936 were frs. 1,150,502,000 and frs. 781,484,000 respectively. At the end of 1935, there were 4,320mi. of main and secondary roads. About 1,000mi. of railway are in operation or under construction, as well as about 500mi. of narrow-gauge railway.

Estimated revenue and expenditure for 1937 were frs. 870,069,500 and frs. 895,057,570 respectively.

**Defence.**—Apart from the sultan's Black Guard, all military forces are drawn from the French Metropolitan and Colonial armies, chiefly African troops, and part of the Foreign Legion.

(R. PIN.)

**Morrison, Herbert Stanley** (1888— ), British politician, was born in East London, and, after being errand boy, shop assistant, telephone operator, and assistant circulation manager of a newspaper, became secretary of the London Labour party in 1915. In 1920–21 he was mayor of Hackney, and in 1923 entered Parliament as a labour member for South Hackney; he was rejected in 1924, regained the seat 1929, lost it again 1931, and regained it in 1935. He was minister of transport 1929–31, and was made a privy councillor in the latter year. In office he was responsible for many reforms in road traffic regulations, as also for drafting the legislation which resulted in the London Passenger Transport Board. Mr. Morrison's outstanding service to his party, however, has been in the sphere of local government. He was the "organizer of victory" who created the electoral machine by which the Labour party secured control, in 1934, of the London County Council and the majority of the Metropolitan Borough Councils, and improved its position in 1937. He has been an L.C.C. alderman and leader of the Council since 1934. As such he has been closely associated with the scheme for a "green belt" round London, with the decision, after 11 years of controversy, to build a new Waterloo bridge, and with other reforms. Besides numerous

pamphlets, he has written *Socialization and Transport* and *How Greater London is Governed*.

**Morrow, Jay Johnson** (1870–1937), American soldier and administrator, governor of the Panama Canal (1921–24; 1925–29), and American member of the commission which mediated the Tacna-Arica boundary dispute. He was born at Fairview, W. Va., Feb. 20, 1870, and graduated from the U.S. Military Academy in 1891. After serving as instructor in military engineering at West Point, he was sent to the Philippines in 1901 as military governor of the Province of Zamboanga. He was the engineering member of the Board of Commissioners for the District of Columbia from 1907–09 and during the World War was chief engineer of the 1st American Army and deputy chief engineer of the American Expeditionary Forces, attaining the rank of brigadier-general. After the Armistice, he first went to Panama as engineer of maintenance, but retired from the Army in 1922 soon after his appointment as governor. He died at Englewood, N.J., April 16, 1937.

**Moscow.** The capital city of the U.S.S.R. and of the R.S.F.S.R. Pop. (1936) 3,567,900. See *Encyclopædia Britannica* vol. 15, p. 838.

With 600,000 workers, the city forms an important industrial centre. Its chief industries are metallurgy, machine building, textiles, clothing, and printing. Output in 1936 was 12,133 million roubles. There is a railway junction (11 lines) and airport. Of great economic importance for the town was the opening, in July, 1937, of the 128km. long Moscow-Volga canal, through which Moscow became a river port in direct connection with the Caspian, Baltic, and White seas.

In accordance with the Ten Years' Plan of the Soviet Government and Communist Party for the rebuilding of Moscow, adopted in July, 1935, considerable building activity took place in 1937, and the old-world city of the pre-War period became more and more modernized. Since May, 1935, Moscow has possessed an underground railway (Metro), the second section of which, 9½mi. long, was finished in Nov. 1937. A third section is now being built, and is to be opened for traffic in 1939. The number of passengers carried in Moscow by tram, bus, and underground was, in 1936, 2,136.6 millions.

In 1936, Moscow possessed 34 theatres, 65 museums, 79 higher educational institutions with 92,195 students, and 83 technical colleges with 32,097 students; 549,579 children attended elementary and secondary schools. See Sir E. D. Simon and others *Moscow in the Making*, London, 1937. (S. YAK.)

**Mosley, Sir Oswald Ernald**, 6th Bart. (1896— ), British politician; educated at Winchester and Sandhurst; in Parliament 1918–31, as successively, Conservative, Independent, and Socialist; chancellor of the Duchy of Lancaster, 1929–30; left the Labour party 1931, to found the "New party," and later became leader of the British Union of Fascists ("Blackshirts," *q.v.*). On Oct. 9 "the leader" was hit by a stone at an open-air meeting in Liverpool and removed unconscious to hospital. On Dec. 8, his assailant was acquitted on the charge of "wounding with intent to cause grievous bodily harm," but on a second charge of "inflicting grievous bodily harm" the jury disagreed. In Feb. 1938, the prosecution offering no evidence, the defendant was discharged. On Oct. 15 damages totalling £20,000 were awarded to Lord Camrose and the Daily Telegraph, Ltd. against the printers, publishers and editor of *Action*, the organ of Sir Oswald's movement, after a libel action in respect of an allegation that Lord Camrose's family had Jewish connections.

NATIVES FLEEING from the storm in *The Hurricane*, a motion picture of the South Seas realistically produced in Hollywood

**Motion Pictures.** Through 1937 and emerging into 1938 the once self-contained and self-sufficient motion picture institution found itself intimately integrated with the whole pattern of world affairs, and in a world of tangled politics and finance. Over most of the globe the screen had by the close of the year become a concern or instrument of Government. Only in the United States, the British Empire and Scandinavia was the motion picture a substantially free medium of expression. Controls and restrictions in other lands varied from coercive taxation to complete bureaucratic operation as in Soviet Russia.

It was the 50th year since the beginnings of Thomas A. Edison's research resulting in the peep-show kinetoscope which broadcast the seed of the cinema around the world in 1894-95. It was also the 41st year of the picture on the screen, the 25th year of the "feature" or multiple reel drama and the 10th year of film recorded sound and talk.

Most of the complexities of the screen's social and political position revealed by the developments of 1937 were to be considered consequences of the acquisition of the spoken word, raising linguistic barriers, racial and sectional considerations and deeply invading the prior complete internationalism of the art.

The end of 1937 found Mickey Mouse in a Graustarkian snarl in Yugoslavia, suspect of fostering revolution, and at the same time the only American screen figure welcomed on the State-ruled screens of Russia. Little Shirley Temple, première box-office star of the world screen, was barred in Germany as a baleful influence on the young. Miss Gracie Fields, Britain's foremost star and comedienne, was honoured by the award of the Order of the British Empire. Original versions of American pictures were permitted in but one theatre of 200 seats in Italy, and in France in five theatres in Paris and five in the provinces. All other showings required "dubbed" versions, bearing sound tracks in the native languages. In Italy all pictures in anywise to be deemed favourable to Great Britain were barred. In France the Russian Soviet product, previously barred, was admitted by the Popular Front Government.

An annual poll of theatres in the United States, Canada and Great Britain, conducted by *Motion Picture Herald*, found showmen of the English-speaking world listing the following as preferred by their audiences: Shirley Temple, first; Clark Gable, second; Robert Taylor and William Powell, third; Gary Cooper,

fourth; Gracie Fields, fifth; Bing Crosby, sixth; Fred Astaire, Ginger Rogers and Georgie Formby, seventh; Jane Withers, eighth; Jeanette MacDonald, ninth; and Sonja Henie, tenth.

Of this list three were British: Jane Withers employed in Hollywood; Miss Fields, also under contract with Twentieth Century-Fox Film Company in Hollywood, but, as was Mr. Formby, elected in this list for work in British pictures. Miss Henie, who came to fame in Hollywood, is a Norwegian.

Viewed in the large, the world map presented a picture of efforts against dominance of the screen by the American industry and its production community of Hollywood. This dominance was entirely commercial in character and a consequence of the World War overseas. Internal issues in many, or most, countries became manifest as exhibitors and theatre interests struggled against nationalistic restrictions to maintain for their screens a flow of the American product to which their box office customers had been conditioned. Meanwhile indigenous producers in every land demanded walls against Hollywood in terms of tariffs, quotas and subsidy. The American industry, ever more international than national in operation and outlook, redoubled its efforts at acquiring and concentrating in Hollywood the most conspicuously important talent of every important national and racial area. In sequel the early days of 1938 found several Governments considering prohibitions against exodus of native stars.

Marked extensions of the use of the screen beyond the confines of amusement were to be observed, notably in advertising and related activities of general industry. Also gestures, promising potential progress, were made toward advancing the use of the screen in formal education. Largely extended use of the sub-standard films, 8mm. and 16mm., due in part to technical improvements in cameras, projectors and sensitive materials, and reduction in costs, became conspicuous in what is commonly designated as the "non-theatrical" field. The 16mm. film which was originally designed for service of the amateur and home audiences was becoming more the servant of industry, while the less expensive tiny 8mm., at first a toy novelty, acquired both capacity

THIS AEROPLANE MOTOR created the violent gale in the scene shown above

and status with an apparent destiny of occupying the home market and the attention of an increasing number of amateurs. Another factor of influence was the increasing availability of libraries of projection prints, presenting subjects especially produced for the markets involved and others at last made available from the accumulations of past releases of the dramatic producers. These developments were the more marked in the United States and in the British Empire. In continental Europe, the 9½mm. film developed and widely introduced by Pathe Freres some years before the advent of sub-standard pictures elsewhere, continued to

dominate the popular and non-theatrical markets, purveying kindred material.

The rising importance and application of the 16mm. film in the United States began toward the end of the year to invade lesser theatres devoted to the showing of standard films and thereby suggesting developments of almost revolutionary significance in the field of established exhibition. This 16mm. entry was gained by reason of its ready utility in the production of local newsreels and topical records, used to supplement programs of pretentious studio drama. It was found that for audiences up to perhaps six hundred persons the image from a 16mm. print could be satisfactorily projected, and that production of simple records of local events was readily within the capacity of ordinary amateur cinematography.

Potentially more important possibilities were introduced by this development, foremost among them the prospect that a new type of small theatre served exclusively by the inexpensive, non-inflammable 16mm. films, and requiring little in the way of projection room attention by skilled operators, might arise to compete with the lesser houses of the standard films in the hinterlands and marginal districts, a market including several thousand theatres in the United States and Canada alone, and with further prospects in communities not now served by the theatres. This was further indicated by the success of a number of small but successful "road show" projects involving the use of 16mm. films carried into remote regions with all equipment for exhibition in light inexpensive motor cars. Continued improvements of sound apparatus gave 16mm. films a recording and reproduction quality comparing favourably with the standards of the pretentiously produced material of the big theatres.

The external manifestations of the medium and disseminations of the technology of picture making and distribution, however, gained scant attention from the established art and industry. The movie industry was and is too completely concerned with its endeavours at maintenance of the status quo and the meeting of continuously obtruding problems of the trade, to give heed to manifestations any more remote than tomorrow.

Less obvious, and in fact apparent to a relatively few intimate observers, was the reluctance of a coterie of the builders of the modern industry to relate themselves to today's great corporations as the officers and servants of those corporations and their stockholders rather than as in the manner of the earlier day when they were masters and substantially sole owners. A consequence is much litigation, many claims, some receiverships and smouldering recurrent conflicts with that sector which the picture industry parlance calls "the bankers." The conflicts in this category of relations also derive impetus from the fact that the motion picture, unlike most extensive industries, is an art and industry of personalities and consequently other factors are insignificant. The loss or acquisition of a handful of names, either in screen figures or executives can affect many millions of dollars and determine the destiny of imposing enterprises. This explains in part many of the extraordinary salaries and bonuses paid to motion picture executives, several of them in the vicinity of \$500,000 a year. The year 1937 saw none of those salaries diminished and some of them increased.

The most important aspect of the international situation was the negotiation for future motion picture trade relations between the United States and Great Britain after the impending expiration in 1938 of the ten year Cinema Films Act of Britain with its rising scale quota. Trade and Parliamentary discussions were extensive. There was however a prospect that legislation might be supplanted by special terms of a general trade treaty between the nations. The terms of the final period of the Act required an exhibition quota of not less than 20% all-British product, a

provision opposed by American interests and a majority of British exhibitors, and supported by British producers and affiliated interests. Meanwhile, in recognition of the motion picture's value of indirect promotion of American trade, the industry was enjoying a friendly attitude in the State Department.

As 1938 dawned a decided majority of the American motion picture concerns were in apparently sound condition. Of the half score of major corporate groups, three were conspicuously prosperous, several others in healthy condition and a remaining three representing probably nearly 30% of the invested capital of the industry, were in varying degrees of difficulty, chiefly internal and representing heritages of the market debacle of 1929 and its sequel depression. Box office business at the theatres, however, continued to promise support sufficient for conservative production operations.

Meanwhile in the production community of Hollywood there was difficulty in many quarters in arriving at an understanding of what might be considered conservative endeavour, in the face of spectacular evolutions affecting the orders of picture making. Two elements conspired to make picture production tremendously more costly. First was the upturn in commodity and labour prices together with a complete unionization of all departments of picture making, which resulted in a direct increase of 30% in costs. Second, and even more expensive, was the establishment of a new level of super-production, a demand for a flow of pictures of a pretentious order without precedent. This advance became acutely obvious by early summer, when Adolph Zukor, in charge of production for Paramount Pictures Corporation, observed: "The pictures that we must make to satisfy the public today represent as big a step upward and forward as the feature picture did in comparison with the short product of the old nickelodeon programs." Not long after, Mr. Zukor announced the budgeting of a production program to include some 20 pictures at about \$1,000,000 each. Meanwhile the world market in the concluding months of the year saw the release of several pictures costing over \$2,000,000, most conspicuously the production of the Napoleonic drama, *Conquest*, variously reported as costing between \$3,600,000 and \$3,800,000. This cost however, it was pointed out, was to be considered as extraordinary in that some of the unusual and unanticipated delays and costs of production were in consequence of the death of the late Irving Thalberg, under whose administration the project was started. Incidentally the high cost of talent of top rank was exemplified in this picture with the reported payment of \$365,000 to Charles Boyer for his rôle of Napoleon, a figure however surpassed conspicuously by an earlier and even more pretentious Thalberg production, *The Good Earth*, in which Paul Muni is said to have received a total of \$407,000 salary.

The remarkable rise in cost of the upper rank of pictures in 1937 was in part a consequence of developments of the depression years. In endeavours to lure the impoverished, bargain hunting public of the United States to the box office, theatres widely adopted the "double bill policy" which meant offering two picture dramas on a program for a single admission. As a result, the demand of showmen was for a premier feature to headline the show and a less costly picture to complete the program. In the beginning both pictures came from the same flow of production. The successful or "hit" pictures became known as "A" pictures and the less successful fillers of the program were classified as "B" products. "A" pictures drew rental prices on their merits, while "B" pictures, regardless of cost, were bought at "filler" prices. Very shortly Hollywood began making "A" and "B" pictures by deliberate planning. The "A" pictures received every attention at any cost, while "B" pictures were more and more cheaply made. Competition for the talent, in all departments, to make "A" pictures became more and more hectic, while the incidental "B" pictures fell into

lower and lower estate. The early councils of 1938 in Hollywood were concerned with restricting budgets.

The American industry faced internal problems in relating itself to radio broadcasting with advertising sponsors drawing heavily upon Hollywood talent. Two concerns, Metro-Goldwyn-Mayer and Warner Brothers made studio contracts, tending to supplant individual star deals with the radio. Other problems were the movement of independent exhibitors to bring about State legislation addressed at divorcing exhibition from production and distribution, an attack on the distributor-owned circuits of theatres, at which something more than 60% of box office admissions are collected in the United States. In one State, North Dakota, the "divorce bill" was enacted into law and was in the process of test in the courts.

Perhaps the most internationally important picture of the year was Herbert Wilcox's British-made *Victoria the Great* starring Anna Neagle. By special sanctions of the Crown and Government access was had by the producer to sources, material and locations, which gave the picture an extraordinary authenticity and documentary quality, superimposed upon its drama.

Japan through 1937 consolidated plans for screen domination of the Orient. All films for Manchoukuo were handled through a Government trust, and early in the autumn an embargo until Jan. 1 on all importation of films, except newsreels under special permit, was put in effect for Japan. In December the embargo was extended to April, 1938, and a commission was sent to the United States to set up arrangements for a special Government-controlled organization to buy all pictures in the American market for Japanese exhibition.

The Argentine was conspicuous among South American States in promoting an indigenous industry by national legislation. Native production vastly increased in India, with increasing difficulties for the American industry. In Mexico, the American industry faced rising native production and feared expropriation by the Leftist Government. (See also ADVERTISING: *Advertising Mediums*; PHOTOGRAPHY: *Motion Pictures*.)

(T. RA.)

**Motor-Boat Racing** witnessed one of its most active seasons in many years in the United States, while in Europe several successful assaults on former speed records succeeded in lifting previous figures to well above their former levels.

The most noteworthy speed achievement was that made by Sir Malcolm Campbell in "Bluebird" when, on Sept. 1, 1937, he set a record of 129.5 statute m.p.h. on Lake Maggiore, bettering the former record of 124.96 m.p.h. held by Gar Wood with "Miss America X" since Oct. 20, 1932. "Bluebird," designed by Fred Cooper, is 23ft. in designed length and is powered with a V-12 Rolls Royce aero motor of 36 litres piston displacement, delivering between 2,000 and 2,500 horsepower. The two runs on

"NOTRE DAME," owned by Herbert Mendelsohn, winning the oldest speed-boat trophy, the Gold Cup, at Detroit

which the record is based were, outward 130.43, and return against the wind, 128.57 statute miles per hour.

On the Seine, in Paris, a French team headed by Jean Dupuy won the Spreckels International Trophy for outboard drive boats for the third time in succession, covering in the two-hour limit, over a short course, 155.566km. (97.3mi.) or an average of 48.6 miles per hour.

In the United States, the race for the Gold Cup, oldest and most cherished speed-boat trophy, saw a field of ten starters in Detroit, including two Italian and one French entry. The winner was Herbert Mendelsohn's "Notre Dame," driven by Clell Perry, which averaged 63.675 statute m.p.h. for the three heats and made 68.645m.p.h. on her best 30-mile heat. The Italian "Alagi," Captain Theo. Rossi, was second with an average of 62.359m.p.h. for the 90 miles. "Notre Dame" also won the President's Cup on the Potomac, U.S., with "Alagi" again second. At the same meet, on Sept. 27, "Alagi" set a world record for Twelve-Litre hydroplanes in the mile trials of 91.408 statute miles per hour. The results of the season's racing shows that the smaller, lighter boats are going faster than larger ones with more power. (H. L. ST.)

**Motor-Buses.** Recent developments have been directed towards refinements in design rather than towards radical changes.

The oil engine, by reason of its high thermal efficiency, is being adopted in Europe, where the fuel prices are favourable, and to a lesser degree in America, where petroleum costs are low. In Italy economic pressure has stimulated the development of buses consuming producer gas using charcoal as fuel. Producer-gas buses are being operated to a lesser extent in other European countries. Much attention has been paid to the reduction of noise and smoke of the oil engine by extensive research into fuel injection and combustion characteristics. There is a tendency to locate the power plant at the rear or underneath the floor in order to provide increased passenger accommodation.

Several transmission systems are being employed to facilitate gear changing. The epicyclic gear-box with the fluid flywheel is widely used in England, electrically operated epicyclic gear-boxes are popular in France, while in Germany multi-speed servo-operated gear-boxes are in favour. In America electric transmission is used on certain of the larger types; in some cases power is supplied direct to the electric motor by overhead wires in urban areas. On arrival at suburban areas, the wires are disconnected, the engine is started, and the vehicle proceeds under its own power. In the automatic transmission group, the hydraulic torque converter has been fitted to some extent in England, while several other devices are still in the experimental stage.

The servo-assisted hydraulic brake is favoured in England while in other European countries, and in America air brakes are largely in use. The development of braking systems which are automatically self-adjusting is being pursued, and it is likely that this feature will be widely adopted.

High tire mileages are now obtainable, and this has led

R MALCOLM CAMPBELL'S "Bluebird," which made a new world's record 129.5 miles an hour on Lake Maggiore, Locarno, 1937

neral reductions in pressure, with a view to enhancing riding comfort, a feature which has been the subject of much research. Variable rate and independent suspension for the passenger vehicle is still in the experimental stage, but considerable advance has been made in connection with seat design. Absorbent rubber materials are superseding the spring type, while the shape of the cushions is carefully designed to give the passenger adequate support.

Air-conditioning plants are being fitted in certain instances in America, while in England heating and ventilation plants are being installed for long-distance travel.

In bodywork design, both interior and exterior, utility has been the major consideration; elaborate decoration has been avoided, but simple colour schemes and the use of fabric-covered panels have provided an attractive appearance. Fully fronted vehicles are popular, while so-called streamlining has been influencing design. In Germany, where the new roads make higher speeds possible, the wind resistance has been effectively reduced by body treatment. In England, large single-deck buses are being constructed with three axles; one recent design has two steerable front axles. This is resorted to on account of the legislation governing the maximum size and weight allowed on a two-axle vehicle. (See also MOTOR CARS: *Trucks and Buses*; MOTOR TRANSPORTATION.) (A. A. M. D.)

**Motor Cars.** Aside from technical and mechanical improvements in the automobile during 1937, there has been a continuation of certain trends in design, and the introduction of new ones. The significant trend still is, as it has been in the past, the rapid obsolescence of previous models. This is not the result of intentional styling by the designers, but rather the result of continued progress by technicians in a number of industries. This can more easily be seen by what has happened in the automobile in years past. For example, the streamline contours of the automobile are the result of improvement in sheet metal and die design. The high compression ratios which result in larger power outputs in modern engines are largely the result of development of anti-knock motor fuels. High engine speeds are the result of development of light, high strength alloys, satisfactory lubricating methods, and fatigue-resisting bearings. Each improvement in design of the automobile has added to its value, but yet most of these improvements have been unaccompanied by raises in price. Processing and manufacturing methods have not kept step with the improvements in design, and as a result an industry producing a product originally in the luxury class has wandered until it has become a ranking industry in the world. Despite the fact that the automobile industry was hampered by strikes and labour trouble in America, the production for 1937 was still 8% above that in 1936. Truck and passenger car factory output in the United States and Canada amounted to 4,975,000 units, passenger cars making up 4,050,000 of the total. The total

wholesale value of products of the automotive industry in the United States amounted to \$4,177,000,000 for the year. The United States finished the year with a total registration of 29,650,000 vehicles, including trucks and buses. World registration at the end of 1937 was estimated to be 42,400,000 units, of which 70% were registered in the United States. Over 517,000 men were employed in automobile and body plants with a weekly payroll amounting to \$15,500,000. The industry as a whole in the United States represented the largest purchaser of gasoline, rubber, steel, malleable iron, mohair, lubricating oils, plate glass, nickel, and lead. At the same time, the industry provided the railroads with 3,725,000 carloads of freight. There were 46,250 car and truck dealers in the United States and 98,529 repair shops. Retail gasoline outlets number 380,000. England is the largest builder of automobiles in Europe, having one car for each 21 people. In the United States there is one car for each five people, but the concentration is not as great as it is in England. The English have 40 automobiles per sq.mi. while the figure is only nine in the United States.

**Trucks and Buses.**—During the past few years several notable trends have been in evidence, mainly, the cab-over-engine tendency, the introduction of Diesel power plants, styling, specialization load equipment, and driver accommodations. The cab-over-engine development came about in answer to the needs for a shorter wheelbase and better visibility for the driver. Several Diesel engines are already in use and more have been announced for production. Because of the expense of building Diesel engines, these engines have become practical only where the saving in fuel costs is enough to overcome the increase in original investment. Older model trucks were built to carry a number of different kinds of loads, and as a result were handicapped in carrying any particular kind. The more recent models are designed specifically for a certain kind of load and as a result lowered costs are obtained. The possibility of combining advertising with load carrying has led to increased styling in trucks, most models being built with smooth lines and attractive finishes. The sleeper cab type of truck is fairly common in vehicles used for long hauls, while a new cab with room for six passengers has been introduced by one company. British truck builders have shown the same trends as the American companies in addition to the development of an eight-wheel lorry. This type vehicle is of the cab-over-engine design and has four front wheels, both pairs being linked to the steering mechanism.

American bus manufacturers have favoured the engine in the rear in the most recent models. This has been done to provide better accessibility for adjustment and service, and also to lighten the driving gear. British bus manufacturers, however, still prefer to locate the power plants in the forward part of the frame.

**Passenger Cars.**—The appearance of the car and the comfort of the passengers both received consideration during 1937. The streamline appearance has been furthered by a smoothing of the lines of the car and by the fairing of external parts of the car

**Motor Racing:** see AUTOMOBILE RACING.

**Motor Transportation.** At the close of 1936 there were approximately 40,287,000 motor vehicles on the roads of the world, an increase of some 8% over the previous year. That there has been a further growth during 1937 is certain from figures published at intervals during the year, but as the year progressed there were signs that the rate of increase was slowing down. The United States of America still leads with 70% of all these vehicles. The following table shows the motor vehicles registered in the principal countries in 1936:—

	Passenger vehicles*	Goods vehicles	Total
United States . . . . .	24,219,000	4,002,000	28,221,000
Great Britain . . . . .	1,755,000	514,000	2,269,000
France . . . . .	1,687,000	480,000	2,167,000
Germany . . . . .	1,061,000	309,000	1,370,000
Canada . . . . .	1,041,000	193,000	1,234,000
Australia . . . . .	511,000	179,000	690,000
Italy . . . . .	300,000	115,000	415,000
Soviet Russia . . . . .	56,000	300,000	356,000
Union of South Africa . . . . .	246,000	34,000	280,000

\*Motor bicycles are excluded.

(This table includes all countries with 250,000 motor vehicles or more.)

In relation to population the United States still heads the list with 4.5 persons to a vehicle, followed by New Zealand with 7 persons, and Canada with 9. European countries are headed by France with 19; Great Britain, 21; Denmark, 27; Belgium, 41; Germany, 49; Italy, 103. If motor bicycles were included, Great Britain would show the greatest development.

Per mile of highway, Great Britain with 11.2 vehicles has the highest density. It is followed by Belgium with 10.2; Switzerland with 8.9; United States with 8.6; Holland, 8.5; Germany and France each with 5.2; while Canada has 2.8 vehicles.

In all countries the road motor vehicle is extending its activities, and everywhere it is causing embarrassment to railways. Where railways are State-owned, this may mean financial embarrassment to the State. The consequent destruction of railway capital earning power has been a potent cause of regulation of motor vehicles. The congestion on the roads leading to extended demands for the expenditure of vast sums on new roads and the improvements of existing roads have also caused action to be taken to limit the numbers of vehicles. Further, the competition between haulers by road has often been destructive of efforts to maintain regular services at reasonable charges and caused such a crop of bankruptcies among the operators as to make a demand from them for regulation.

The regulation has taken many forms. In Northern Ireland, for example, it resulted in the establishment of a board to take over all the road services. A similar board was established for the railway, and the two were to endeavour to work for the economic co-ordination of road and rail. So far the Road Transport board has made a substantial loss (£200,000=\$1,000,000), and an enquiry is to be held. In South Africa a large part of the road transport is conducted by the railways, other parties being limited or extended, and similar action is being taken in New Zealand. In Germany, the rates charged for distances of over 50kms. by road must equal certain railway rates. To make the law effective haulers are strictly divided into those who limit the work to a maximum of 50kms., and those who engage only in long distance haulage. The latter must all belong to a State association, and all transactions must be settled through it. This division is obviously uneconomic. In the United States the problem is rendered very difficult by the division between Federal and

States authority, and the wide differences between the action taken by the individual States. The result is that the desired co-ordination between rail and road transport has made little headway. In Great Britain the licensing system has been used to check new entry and hinder expansion of road carriers for hire, and by degrees order is replacing a chaotic condition.

Other countries are trying other ways of solving the problem, but no country has so far succeeded or seems likely to do so. This is because in none are the hours and wages of men employed in road transport made similar to those usual on the railways, and in no country has road transport been placed under the same regulations as regards rates, and the same obligations as regards carrying. In the United States an Act prohibits undue preferences, but such legislation cannot be made effective so long as the carriers by road are so numerous and so little organized. A further difficulty in the way of arriving at an economic division of function is that while railway traffic is required to pay rates which will provide for interest on the capital expended on the track, in few countries does the taxation on motor vehicles and their fuel provide for any surplus on their share of the current expenditure on roads. The taxation is increasing, and in the United States preliminary figures indicate it reached the sum of \$1,580,000,000 in 1937, while in Great Britain it totalled about £73,000,000, compared with a current road expenditure of about £60,000,000. Such figures indicate that in this respect the difference between road and rail is being substantially modified.

A matter of grave concern in connection with motor transport is the number of persons killed and injured by motor vehicles on the roads. Much is being done in the way of testing drivers before issuing licences; installing traffic lights, notices, and other systems of control; including highway safety courses in the curricula of primary and secondary schools; improving road surfaces so as to reduce the liability to skid; constructing by-pass roads to reduce the traffic passing through narrow streets in towns; improving the brakes on vehicles and their inspection. In spite of this, few countries can show any material reduction in the toll of accidents. The most that can be said is that the accident are not rising with the growth in the number of vehicles in use. The following figures show the number of automobile deaths per 10,000 motor vehicles in 1936 in the countries named:—

Canada . . . . .	10.5	Great Britain . . . . .	25.1
Union of S. Africa . . . . .	11.2	Germany . . . . .	42.1
Norway . . . . .	12.8	Belgium . . . . .	43.1
United States . . . . .	13.0	Switzerland . . . . .	49.1
Australia . . . . .	16.8	Holland . . . . .	51.1
Sweden . . . . .	23.1	Italy . . . . .	61.1

In the United States of America the deaths have risen every year during the past 15 years except in 1932, and in 1937 were 39,700, which are more than double the number in 1923—18,400. In Great Britain the deaths in 1937 numbered 6,591, which was 30 more than in 1936, while the number of injured was 226,339—a decrease of 1,474. In South Africa in 1936 the persons killed numbered 1,015, and the injured 14,406. (See also AGRICULTURE *Internal Combustion Engine*.)

(W. T. ST.)

**United States.**—Highway transport is America's fastest growing form of public transportation. The volume of business carried is extremely large and constantly growing larger. The enactment of State laws and of the Federal Motor Carrier Act of 1935 already has done much toward putting this form of transport on a firm foundation. The Federal law is being interpreted slowly and gradually along sound economic lines. Since 1935 the Motor Carrier Bureau of the I.C.C. has prescribed rules and regulations governing insurance requirements, and for safety of operations has required reports of accidents serious

enough to involve major injuries and fatalities; has issued identification plates for all carriers coming under the act; has promulgated an accounting classification; has issued a fair-sized number of certificates of convenience and necessity; has prescribed hours of service for drivers; has required the filing of tariffs and forced compliance with the filed rates. But much remains yet to be done, for new applications for extensions and mergers are being filed at a faster rate than they can be passed upon.

The number of truck operations exceeds that of the bus because trucks are used not only by cartage companies in cities but by "over the road" haulers and by private businesses as a part of their service to consumers. Yet the motor-bus has made rapid strides in both city and long haul service. At the end of 1937 bus operations were found in 801 of the 982 cities that had a population of 10,000 or more. Further analysis showed that in 496 of these cities motor-buses have entirely supplanted all other means of fixed route public transportation. This group of companies owned 24,500 motor-buses and in 1937 the number of passengers carried was estimated at 2,810,000,000. Total revenue from operation amounted to \$192,100,000. Inter-city carriers linked together practically every important city and town in the United States. Such carriers owned 24,750 vehicles ranging from 7-passenger sedans to 33-passenger streamlined cruisers operated by large companies on through routes connecting the larger and more important cities. For 1937 it was estimated 627,000,000 passengers were carried by this group and operating revenues totalled \$298,000,000. By far the majority of bus-operating companies were owned by individuals or corporations not connected with other forms of transportation. In cities, however, electric railroads that were still functioning owned 13,500 buses, which are operated as a part of their service, either directly or through subsidiaries. In the inter-city field some 60 steam railroads also had considerable interest in highway transport.

In 1937 the motor-buses operating over regular or fixed routes in the United States with little more than 5% of the combined total plant and equipment investment in passenger transport facilities carried 28.6% of the total number of passengers handled by all facilities and obtained a little more than 27% of the operating revenues and yielded a fairly reasonable return on its investment.

Highway transport by "over the road" haulers was a development dating back to the railroad embargo period during the World War. Born of necessity to get shipments through to destination more quickly, the "ship by truck" movement became general in every part of the country. Regular routes have now been es-

tablished, operating on schedule and charging published tariff rates. Many classes of commodities are handled. More than half the nation's livestock is transported to market by motor truck, along with three-fourths of the perishable fruit and practically all the milk supply of metropolitan communities. The U.S. Department of Commerce showed in 1935 three-fourths of the 188,809 trucks owned by 61,216 for-hire truckers operated locally. It is said that farmers have 1,000,000 trucks. A count of trucks in the 93 cities with over 100,000 population as of July 1, 1936, showed 938,500. From these figures, there are at most 2,000,000 for-hire trucks, of which 75% are found in local cartage.

(C. W. S.)

**Motor Trucks.** In recent years there has been a general tendency to improve the outward appearance of motor trucks, as well as those features of their design which make for driver's comfort. Cabs are now generally of all-steel construction, with well-rounded contours, provision for good vision, and adequate means of ventilation. Appearance has been improved also by the use of deeply crowned fenders and ornamental radiator grilles.

The general design of trucks has been influenced to a considerable extent by local regulations and local conditions with respect to fuel supply. In the United States there has been a strong tendency toward the cab-over-engine type of truck, in which the driver is seated over the engine instead of behind it. This design shortens the truck for a given length of loading space, which is of value in that it conserves space in garaging, parking, etc., and in that it makes the vehicle more maneuverable. It also gives a better distribution of load between the front and rear axles. Heavy four-wheeled trucks usually are equipped with single front and dual rear tires of the same size, and to load all tires equally there must be half as much load on the front as on the rear axle. With the cab-over-engine design this load distribution is easily achieved, whereas with the conventional lay-out the load on the front axle is usually much less than that required by this rule.

A recent trend in British truck design has been to increase the pay-load capacity of trucks of 2½ long tons unladen weight far beyond what has been customary in the past. Up to some years ago such trucks had a pay-load capacity of something less than 2 long tons, but this year a number of British manufacturers have succeeded in producing trucks coming within this unladen-weight limit which have a pay-load capacity of 5½ tons. The reason behind this development is that under a new law adopted some years ago, the speed limit for trucks of less than 2½ tons unladen weight is 30 m.p.h. whereas that for heavier trucks is 20 miles per hour. The total number of trucks of more than 5½ tons pay load produced annually is quite small.

A new type of truck produced in England during the past year has four front steering wheels and two rear driving wheels. The advantage claimed is that there is less side-skidding of tires in turning corners than with the conventional six-wheeler having two steering and four driving wheels, as the steering wheels can be so linked together that in turning corners the axes of all wheels produced meet (nearly) in a common point, which is the condition of skidless turning.

For some years past all trucks of two tons and more load capacity produced in European countries have been equipped with Diesel (heavy-oil) engines, which latter burn a fuel that is cheaper than gasoline, and only about one-half the volume per horse-power-hour produced. In Continental countries, however, and particularly in Germany and Italy, there has been a drive to substitute motor fuels of domestic origin, such as coal gas and producer gas, for the imported petroleum fuels that so far have

RIGHTENING A TARPULIN for a long truck haul through the U. S. South-west

**MOTOR TRUCK** built to travel on railroad tracks or highways without changing tires or wheels

been used almost exclusively. Manufacturers in these countries now equip trucks with engines that are readily convertible from Diesel or compression-ignition to gas or spark-ignition engines.

During the 12 months which ended Sept. 30, 1937, 928,072 motor trucks were produced in the United States and Canada. It is customary to combine the productions of these two countries, because all or practically all Canadian plants are branch plants of firms domiciled in the United States. In the United Kingdom production of motor trucks increased from 92,176 in 1935 to 107,609 in 1936. (See also **MOTOR CARS: Trucks and Buses; MOTOR TRANSPORTATION.**) (P. M. H.)

**Mountain Climbing.** In the Alps the summer of 1937 was favourable until the middle of August, but since the last unclimbed routes of the Matterhorn were overrun by the end of the season in 1932, and the formidable northern cliffs of the Grandes Jorasses were stormed in 1935, the field for new ascents in Europe is exhausted, and explorers turn their attention to more distant ranges.

Fortunately, Alpine accidents were less noteworthy than in 1936. There was one exception, however, in the case of the astonishing drama staged by two young men in Bavaria, who embarked on a particularly difficult way up the Watzmann in bad weather in midwinter. They also created a new precedent in the annals of mountaineering by refraining at first from co-operating with the rescuers and refusing to answer shouts. Eventually the heroic exertions of an enormous search-party, comprising the élite of Bavarian climbers carrying thousands of feet of rope, preceded by aeroplanes and supported by regular troops, made it possible to rescue the two men from the consequences of their folly, and lodge them safely in hospital—but only after a desperate struggle lasting a whole week and gravely endangering numerous lives. The Central Committee of the Swiss Alpine Club has published a manifesto deprecating the granting of testimonials and rewards for mountaineering performances of this sort.

In Alaska a fine achievement by American mountaineers was the first ascent, by Washburn and Bates, of Mount Lucania, 17,150ft. above sea-level, the highest virgin peak in North America.

In the Caucasus a British expedition ascended the south peak of the Matterhorn-like Ushba, and effected a new route up the great ice-face of the beautiful snow-mountain, Tetnuld, another big Caucasian peak.

Among various Himalayan ascents which reached heights of 24,000ft., was a spirited attempt on Kamet, the peak of 25,450ft., first climbed by the Smythe expedition in 1931. In June three

corporals and a private serving in the 1st Battalion of the East Surrey Regiment in India established a camp at 21,000ft., and got to 23,500ft. without the help of any porters. Another fine feat was Chapman's ascent of the great peak of Chomolhari, situated on the borders of Tibet and Bhotan, almost 24,000ft. above the sea. Smythe and Oliver in Garhwal also ascended the fine up-standing satellite of Kamet known as Mana Peak, 23,862ft.: this was described by Smythe as the hardest climb he has ever done.

In the north-west Himalaya one of the strongest parties ever organized, consisting of German climbers under the leadership of Dr. Wien, and accompanied by first-rate Himalayan porters, met with a terrible disaster on the gigantic virgin peak of Nanga Parbat, already notorious for the destruction of ten men under Herr Merkl in the stormy weather of 1934. In 1937, through no fault of its own, practically the whole expedition was wiped out in the night in a minor ice-avalanche which overwhelmed the camp at a height of 20,000 feet.

**BIBLIOGRAPHY.**—*Alpine Journal*, No. 225 (Season of 1937); *Quarterly Review*, April 1935 (Nanga Parbat); *Mitteilungen of the Deutsche u. Oesterreidrische Alpen-Verein*, 1937 (Accident on Watzmann). (C. F. ME.)

**Mount Holyoke College**, pioneer American institution for the higher education of women founded in 1837 by Mary Lyon and situated at South Hadley, Massachusetts. Official centenary celebrations were held on May 7 and 8, 1937, during the administration of Dr. Mary E. Woolley, who completed on June 30 exactly 36 years and 6 months of service as president. She was succeeded by Dr. Roswell Gray Ham, Ph.D., LL.D., whose inauguration took place at the opening of the 101st academic year. Founder's Day exercises on November 5 marked the actual 100th anniversary of the seminary. The registration figures for the 1937 session are: 966 undergraduates, 52 graduate students, 3 unclassified, in residence; 19 students at Mount Holyoke (freshman year) in Hartford, Conn.; 6 juniors in France and 3 in Germany. The faculty numbers 136. The endowment fund, as of June 30, 1937, was \$4,899,649.21; the total college income for preceding year was \$1,257,123.52; the centennial gifts received during 1935-37 were \$920,992.38. (R. G. HA.)

**Mozambique**, a Portuguese colony on the E. coast of Africa, bounded N. by Tanganyika and S. by Natal, with Lake Nyasa and Nyasaland, North and South Rhodesia, the Transvaal and Swaziland on the W.; area 297,700 sq.mi.; pop. 4,028,750, of whom all but 36,000 are natives. Lorenzo-Marques is the capital and one of the chief ports; others are Mozambique, Beira, Porto Amélia and Quelimane. The colony supplies large contingents of native labourers to the mines of the Transvaal and Southern Rhodesia, as well as to its own mines, including gold—of which £1,940 was exported in 1934. The chief products are sugar, maize, coco-nuts and copra, sisal, citrons and beeswax. In 1935 imports totalled about £2,244,630 and exports £1,758,920; and in 1935-36 the budget balanced at about £2,980,000. A small defence force of 100 Portuguese officers and 2,400 men, with 2,000 native troops, is maintained.

There are 460mi. of railway under State administration, and lines from Lorenzo Marques and Beira connect with the general South African railway system, communication also being available to Lobito Bay, Angola, on the W. coast. In 1937 an expenditure of £3,000,000 on new railways, roads, posts, and other public works was sanctioned. There are over 3,150mi. of motor roads in the colony, 7,200mi. of telegraph line, and about 4,000mi. of telephone. Early in 1938 a passenger air-service was inaugurated connecting Lorenzo Marques with the Imperial Airways bi-weekly services with Johannesburg, the largest hangar in Africa having

een erected at Lorenzo Marques. In 1937 the construction of ve directional radio stations was approved.

**Mufti, The Grand** (OF JERUSALEM), Haj Amin Effendi Al Hussein (c. 1878— ), half-brother of is predecessor, was educated for the post at the Azhar university, Cairo; during the World War served with Feisal at Damascus and with the Military Governor of Jerusalem, assisting in recruiting; but after the Balfour Declaration became anti-British, and in 1920 fled to Transjordan to avoid serving a sentence of 10 years' imprisonment. Returning under amnesty, he was (1921) appointed by the British authorities to the Grand Muftiship, in 1922 being elected president of the Supreme Moslem Council, in which capacity he had control both of the religious Courts and of some £120,000 per annum. Responsible to some extent for recurring anti-Zionist disturbances, in 1936 he was elected president of the newly formed Arab High Committee (see PALESTINE), and endorsed the strike against and boycott of the Royal Commission in the autumn, though in Jan. 1937 he appeared before that body, testifying to the complete hostility of himself and his followers to any Jewish home in Palestine. In July 1937, when it was clear that his influence was employed against the administration and the headquarters of the higher Arab Committee was raided by the police, he escaped, and on October 1 was deprived of his offices—the H.A.C. and all National Committees being simultaneously declared unlawful. On October 16 he escaped from his hiding-place in Jerusalem, and was eventually granted asylum in the Lebanese Republic by the French administration, which acted on information received from the British Foreign Office.

**Municipal Airport of Cleveland:** see AIRPORTS: Plan.

**Municipal Airport of Newark:** see AIRPORTS: Plan.

**Municipal Government.** The outstanding events in municipal government during 1937 have to do with public housing, strikes, relief, health, finance, and politics. The United States Housing Authority was set up by act of Congress on Aug. 21, 1937, as a permanent agency, with \$500,000,000 to spend, primarily to encourage public housing in cities. There were, Jan. 1, 1938, some 50 municipal housing authorities; and some 20 municipal projects, including the \$13,500,000 Williamsburg apartments, have been completed under emergency Federal grants. This is the beginning of public housing as a normal municipal function in the United States.

Strikes have been the chief problem of municipal police, though a spectacular crusade against racketeers was carried on in the city of New York by a special prosecutor appointed by the Governor. Sit-down strikes made their appearance with mass and sympathetic picketing. Serious disorder resulted in Chicago, Detroit, Youngstown and other automobile and steel centres. This obscured the nation-wide rise in the urban crime rate for 1937 after five years of steady decline. Municipal relief costs dipped somewhat during the spring and summer, but rose again toward the end of the year. The number employed on work relief decreased continuously as many highway, bridge, park, school and other projects came to completion. Few new major projects were undertaken. (See STRIKES AND LOCK-OUTS.)

The nation-wide anti-syphilis campaign of the U.S. Public Health Service was spectacularly advanced through an intensive city program in Chicago and the beginning of similar campaigns at other centres. The general health record of cities continued to improve along with a drop in death rates. A study of city population by the National Resources Committee, published during

the year, lists 3,165 cities in continental United States, of which 96 are metropolitan districts, and shows that the population of the urban centres does not reproduce itself and that the trend of the city birth rate is still downward. City school attendance figures showed a distinct drop in the early grades.

In the field of municipal finance the trend has been encouraging. By the close of 1937, all but one of the serious debt defaults of the larger municipalities had been composed. Though city tax levies increased slightly, tax collections show less delinquency than at any time since 1931. An important study released by the New York Planning Council shows that premature land subdivision and improvement has been the chief cause of permanent financial and governmental embarrassment in many American cities. Congress enacted a new Municipal Debt Relief Act to take the place of the former Municipal Bankruptcy Act which was invalidated by the Supreme Court. New legislation with regard to municipal accounting, auditing, and reporting was enacted by 20 States. City credit continued to improve. Long-time municipal borrowing fell to its lowest point in ten years, except for 1932, though the municipal bond yield for the 20 largest cities was 2.62% in Jan. 1937, the lowest recorded in 43 years. No important new sources of revenue were developed by cities. New York city and New Orleans continue to be the only important cities levying city sales taxes. Real estate continued to carry 60 to 70% of the local tax load. There were no important city boundary extensions, and city-county consolidation was defeated by the voters in Atlanta, Philadelphia and Milwaukee.

There has been a continuous spread of the merit system among municipal employees. The more notable advances during the year took place in Los Angeles, Akron, Tucson, 11 New Jersey cities and New York city, where "career service" is being extended upward to include the top non-policy posts, and to include police court justices as well. During 1937, pay cuts of municipal employees were restored in many centres. Training schools for city employees, attended by over 15,000 officials, were held primarily by State leagues of municipalities as in New York, Virginia, Kansas, California and Minnesota.

Many important city elections were held. The old-line political machines did not fare well, though they continued to hold certain centres. City manager charters were repealed by the voters in Binghamton, N.Y., and Knoxville, Tenn., but sustained two to one in Toledo, Ohio. In most cities the voters as a whole supported "law and order" and the expansion of municipal services, and showed increased political independence. The most notable election was that in New York city, in which the new Labor Party won the balance of power and joined Fusion in keeping Mayor La Guardia in office with his record of broad social service, efficiency, merit appointments and humanized government. New York's large "rubber stamp" board of aldermen disappeared on December 31 and its place was taken by a city council of 26 elected by "proportional representation." (L. Gu.)

The reorganization of local government areas in England and Wales, begun in 1932 and intended to reduce their number and to bring their boundaries into greater accordance with social and economic realities, was almost completed by the end of 1937. The numbers of urban and rural district councils were considerably reduced, and at the end of the year there were 299 municipal boroughs, 634 urban districts, and 506 rural districts in the country. The county of Middlesex has now achieved the unpleasant distinction of complete urbanization, and is the only administrative county, other than London itself, to have no "rural districts" within its boundaries. No additions have been made for some years to the number of municipal authorities exercising county borough powers; but a number of urban districts, especially in the Greater London (see LONDON) area and in the

industrial midlands and north, have sought and obtained characters of incorporation as municipal boroughs, 32 having done so since 1931.

Local government expenditure in Great Britain now amounts to over £600,000,000 per annum, towards which in 1936-37 about £193,000,000 was raised by local rates, rather over half of the remainder being supplied by Government grants. The rateable value of England and Wales for 1936-37 was approximately £300,000,000.

**Munitions of War.** For the most part, the year 1937 witnessed no revolutionary changes in the composition, evolution, or tactical employment of munitions of war. But if it did not bring forth much that was epoch-making, it compensated in volume and variety for any paucity of invention. All major nations devoted increasingly large proportions of their budgets to the development of existing and experimental types of armament, and all save the United States to the accumulation of huge war reserves of these. Notable was Great Britain, now in the midst of her £1,500,000,000 rearmament program, the cost of which, according to reliable predictions, is likely to come closer to £2,000,000,000 ere it meets completion. (See REARMAMENT.)

Acute international situations emphasized the broad connotation of the word "munitions," which, ever recognized by the military, is at last being better appreciated by the lay civilian. For the term applies by no means exclusively to implements of combat, but rather embraces many of the raw materials entering into their fabrication, or contributing directly or indirectly to their manufacture and employment. Thus the 234,000 gross tons of steel and 427,886 tons of scrap iron exported from the United States in April 1937 (an all-time high for any one month since 1921) largely constituted, in effect, war munitions, although not so classified under her neutrality act of 1935, and caused numerous agencies committed to programs for Universal Peace almost as much concern as though they had been finished guns and projectiles.

Yet whatever their social and economic significance, it is patent that munitions, even in times of peace, are playing an increasingly important part in our daily life. Witness the fact that Poland launched in 1937 an expensive ten-year program for moving her entire armament industry, now located in Upper Silesia, into a triangle of land at the mouth of the San. There, it is best protected in event of hostilities.

With any discussion of munitions is inseparably connected some reference to their tactical employment. Hence frequent mention will be made of observations based upon the current war in Spain, and the resultant effects which these are exerting on armament trends the world over. Such trends have, for the most part, run closely parallel; for secrecy in design and development is well-nigh impossible, one nation's accomplishment of today becoming common property tomorrow. Hence no studied effort will be made to outline the achievements of individual commonwealths, but rather to indicate world-wide tendencies in the following basic instruments of modern warfare.

**Aircraft.**—Huge expansion programs are everywhere in evidence. Thus a credible estimate reckons the number of military aircraft in Europe as of Jan. 1937 at 25,000 to 30,000, with a prediction that this figure might readily be doubled by the beginning of 1938. Great Britain alone budgeted during 1937 a gross of £48,132,000 for her air forces, as against £30,340,000 in 1936.

The military characteristics of aircraft of all types underwent material improvement. The latest bombers operate at top speeds of 250-280 m.p.h., weigh up to 30 tons, have wing spreads of 150

ft. and carry more and larger guns, capable of resisting attack from any angle. Recent observations in Spain indicate that their increased speed perhaps offers greater defence against attack by pursuit planes than does the heavy armament. But all-metal ships have proved more vulnerable to machine-gun and cannon fire than those of composite construction, requiring more extensive repair after damage. And tractable landing gears, injured by gunfire, have caused the loss, on landing, of many ships which might otherwise have been safely grounded.

Fighting planes now attain speeds of 300 m.p.h., with ceiling of 30,000 feet. Conventional armament includes two automatic cannon forward, and two machine guns aft. An automatic landing device perfected during 1937 by the U.S. Army Air Corps and assuring safe landings without human hands touching the controls, constitutes one of the outstanding achievements of the year.

Air transport of troops and *matériel* is receiving increased attention, notably in Russia and France. It is of record that at one manoeuvre in the former country, 1,200 men and 18 guns plus 150 machine guns, light and heavy, were transported 10 miles and then landed by parachutes in eight minutes. Complete field hospitals with full equipments of personnel and *matériel* have likewise been successfully so landed, the number of trained parachutists in the Soviet Army now being estimated at 70,000. Sardonicly, parachutes have proved death traps for many Spanish aviators, their opponents machine-gunning them at leisure after they have left their disabled ships. Spanish war experience has failed to substantiate predictions that civil aircraft can readily and successfully be converted for military use; such planes as have been so converted have proved particularly vulnerable to attack by others of standard military types.

**Anti-Aircraft.**—The accuracy of anti-aircraft fire is constantly increasing, so much so that current observations indicate that the ratio of ships brought down by pursuit craft to those destroyed by gunfire from the ground, which during the World War was five to one, has now been completely reversed in favour of the artillery. The so-called "parallel barrage" in which batteries of anti-aircraft weapons, electrically controlled and synchronized, place a curtain of fire before an advancing plane, has proved highly effective. Searchlights up to 60 in. diameter (mobile) and 80 in. (fixed) now have a range, in clear weather, of 9,000 yards. Employed in groups of four and converging on the target from points 2,000 to 4,000 yds. apart, they render invaluable aid to the anti-aircraft artillery during night operations. Increased perfection in sound-ranging instruments (for detecting the sound of an aeroplane motor at great distances, and locating its position) has also been achieved, although the rapid development of motor silencers offers a new problem to combat. Solution may lie, however, in a recent invention which locates a plane by heat rays emanating from its motor, even though this may at the moment be "cut out" (stopped) to confuse sound detectors.

Experimentally, "Grenade Planes" armed with fifteen 45 lb. bombs, to be released successively through "torpedo tubes" from a position above and slightly ahead of a hostile bomber, are said to be under consideration by two major nations. Huge net pendant from floating balloons and designed to entrap oncoming aircraft, are reported as having been developed by at least one of the Great Powers.

**Tanks.**—Armour is increasing in weight, it having been demonstrated that plates of less than 35 mm. in thickness are vulnerable to infantry cannon. As a result, maximum speeds have been revised downward, though a battle speed of 18-20 m.p.h. is still considered most desirable. Armament remains more or less standardized in the form of an automatic cannon of 37 mm. calibre or thereabout, plus one or more machine guns per tank. Diesels

75MM. FIELDPIECE in firing position

TYPE OF LIGHT U.S. ARMY TANK

HOWITZER of 155mm. calibre in firing position

A 155MM. GUN CARRIAGE

lower plants are under constant development, as are motors of more conventional design. France and Russia are devoting some attention to super-tanks weighing up to 70 tons. Certain observers hold that these possess capabilities even in excess of their size, maintaining that seven 100-ton tanks would equal in effectiveness in the field of battle, 100 of seven tons. General practice however indicates a tendency toward standardizing on a light tank of eight to nine tons, and a heavier type of not over fifteen tons. However, mammoth "support" tanks mounting guns of up to 4in. and even 6in. calibre are under consideration in France, and "transport" tanks, for bringing up infantry to consolidate positions gained by battle tanks, appear also to be on the cards.

**Anti-Tank Defence.**—Here, various nations are employing single-shot, quick-firing, and automatic guns of calibres up to 77 millimetres. One German school holds for the value of the first-named because of its readiness of concealment, one-man transport, and consequent possibility of heavy concentration at threatened points. Made in 13.35, 17, and 20mm. calibres, and weighing 65 to 90 lbs., these are modern elaborations upon the 37mm. anti-tank gun of World War fame. Admittedly effective against armour up to 25 or 30mm. in thickness, they would appear ineffectual against the stouter plating now being introduced.

Aside from projectile weapons, other anti-tank agencies being given consideration are mine-fields and "catch trenches" (*i.e.*, tank traps). "Tank Chasers," lightly armoured cars of high manoeuvrability carrying guns capable of penetrating tank hulls, have been tested, but proving highly vulnerable have re-

quired heavier armour, with consequent reduced speed, resulting in their gradual transmutation into veritable tanks themselves. Bombing from above, by aircraft, has not proved effective against massed tank attacks.

**Artillery.**—Trends are toward attaching more and heavier artillery equipment to infantry units. Thus the armament of a Soviet infantry regiment now includes: 81 light machine guns, 60 heavy machine guns, 27 grenade throwers, 6 small cannon (37mm.), 6 regimental cannon (76mm.), and 2 anti-aircraft guns; while Italian practice hereafter will be to incorporate in each infantry regiment, four pieces of pack artillery (*i.e.*, a battery of sixty-five 17mm. cannon). The United States has not gone so far in this direction, however, the tables of organization for an infantry regiment of 110 officers and 2,362 men in her new infantry division of 12,839 men (as against a World War figure of approximately 22,000) calling for 72 light machine guns, 36 heavy machine guns, and 36 light mortars.

**Infantry Shoulder Weapons.**—Despite the fact that various types of semi-automatic rifles were in use during the World War, no nation has as yet completely supplied its foot soldiers with *matériel* of this nature. Such a step is now in progress in the United States, however, that country having entered upon active production of the .30-calibre Garand semi-automatic rifle which will gradually supplant its present infantry piece, the Springfield rifle, model of 1903.

**Chemical Warfare.**—Progress in chemical warfare has been almost entirely in the field of defence. All European nations,

recognizing the possibility of sudden gas attacks, exerted during 1937 every effort toward developing adequate means for neutralizing the danger. Production of gas masks for civilian use in Great Britain reached the stupendous figure of 500,000 per week. This huge output made possible the very modest unit cost of but 2s. 6d. each. (Masks for combat troops are more complicated, more expensive and more efficient.) Germany designates her civilian-type masks as of three classes, one for men, one for women, and one for children. Italy is unique in that her largest life assurance society now offers to advance to its policyholders, loans to finance the purchase of masks at 76-70 lira each.

General tendencies are toward standardization on three types of mask, the most effective for the military and civilians engaged in home defence activities, the second for civilians actively employed but not so engaged, and the third for inactive civilians. Gas-proof clothing for personnel assigned to degassing operations is being produced in increasing quantities. The construction of gas-proof shelters capable of housing one to 8,000 persons is actively under way. In one such, with a capacity of 25 people, power for operating the fan of the air-purifying and ventilating apparatus derives from a bicycle drive actuated by the foot-power of one man. Other similar machines to be operated by two to four men have capacities of about 25 persons per operator. Those with capacities of above 100 persons have motor-driven fans.

**Engineer Corps Equipment.**—Marked advance has been made in reducing the weight, and thus increasing the portability of pontoon boats, as well as of collapsible vessels designed for the transport of troops across small bodies of water. Thus Japan now employs four types of rubber rowboats, weighing from 15.8 to 75.5kg., with capacities of from 2 men for the smallest, to 4 rowers and 12 passengers for the largest. Still another variety, weighing 120kg., is used (in pairs) for the construction of rafts (a platform being added), capable of transporting a fieldpiece with its equipment, or 30 men. The United States has substituted an 1,100lb. aluminium boat for a former 1,800lb. vessel of wood, with highly satisfactory results. Swedish army engineers have developed practicable bridge-building materials from cardboard, which disintegrates in water after serving its purpose. In the field of signal corps equipment, considerable progress was recorded during 1937 toward increased perfection of two-way field radio apparatus. (See also WORLD ARMAMENTS; CHEMICAL WARFARE.) (C. Gd.)

**Music.** Music in 1937 continued to display the chastened mood that set in after three decades of feverish innovation. That period might be defined as extending from the earliest works of Debussy to the last of Alban Berg. Then one composer after another added to the technical armoury of his craft.

New theories, new 'isms appeared in a procession which ultimately threatened to become monotonous. The lull began to set in a few years ago, and now the musical world is occupied in sorting out, testing, and assimilating the new devices it has acquired. This is naturally less exciting than inventing them, but in the end it is likely to prove more useful to the art of music. It is, however, having one unforeseen result, that of lessening the differences between composers and bringing them back to the use of a common language—or rather two languages, for one great cleavage still divides them, that between composers who are faithful to the principles of tonality and those who have deserted them for atonal methods.

**Music Festivals.**—Apart from this one serious divergence there exist such affinities between young composers of different nations that one commentator on the 15th Festival of the International Society for Contemporary Music (Paris, June 1937) remarked that, if the country of origin of each work had not been indicated, no listener could have guessed it, as "the more you heard, the more they seemed alike." These festivals of music selected by an international jury, no two of whose members may be of the same nationality, constitute a useful gauge of musical fertility, but although primarily designed as an international arena for heterodox musicians who, in the nature of things, encounter opposition, it is noteworthy how, year by year, these become less conspicuous, and the festivals tend to rely more and more upon names which are either already famous or at least familiar.

Thus, at the Paris festival, apart from in memoriam performances of works by Dukas and Szymanowski, who had died during the 12 months preceding the festival, the jury's selection included string quartets by Honegger and Milhaud, a suite by Florent Schmitt, a symphony by Malipiero, which had previously had its world première at Seattle, and other works by composers of note without which the festival would have proved of much less interest. There were works by Conrad Beck, Luigi Dallapiccola, Jean Françaix, Elisabeth Maconchy, Alan Bush, Hanns Eisler—all names previously known—but there were no "discoveries" unless a concerto for string quartet and orchestra by Joseph Valls be accounted such. The Poles arranged a separate concert at which works by Wojtowicz and Maciejewski were applauded, and there the story ends. The Maggio Musicale at Florence was mainly concerned with the past, but an evening was devoted to the memory of Respighi, whose posthumous *Lucrezia Romana* has been completed by his widow, and an oratorio by Malipiero, *La Passione*, was performed.

The Venice Festival of Contemporary Music again brought mainly familiar names to the front: Stravinsky, Malipiero, Dallapiccola, Markievich, Françaix, and Roy Harris. The attention attracted by the International Society for Contemporary Music has led to the foundation of many similar festivals in different countries. But the general report of them is that there was nothing that excited either extravagant enthusiasm or acute controversy. Some say that the musical world is losing its capacity for either, but it is more likely that the capacity has not been put to the test. Yet the attention given to contemporary music has increased considerably.

Early in 1937, the American League of Composers published a statement that during the previous six years it had performed 493 works by living composers, and the Federal Music Project at Washington has listed performances of 5,000 works by 2,000 American composers between Oct. 1935 and March 31, 1937.

Among the various national sections of the I.S.C.M., the British (London Contemporary Music Centre) is outstandingly active, and the British Broadcasting Corporation devotes a monthly concert to contemporary music of the most challenging kind.

In Paris, a new group has been formed after the pattern of Les Six, and the École d'Arcueil. It calls itself "La Jeune France," and consists of Olivier Messiaen (organist, pupil of Dukas), Daniel Lesur (Schola Cantorum), Yves Baudrier, and André Jolivet, eldest (born 1905) and least orthodox of the group.

**Symphonies.**—The most remarkable trend in composition is the general return to the absolute, *i.e.* non-program symphony, which would have aroused the surprise and envy of symphonists of the post-classic era. Glazunov, for instance, one of the last of them, composed his 8th Symphony in 1904 and lived until 1936 without writing another. In the decade following upon the war period one might have thought the symphony moribund. In 1937, Miskovsky eclipsed all modern records by composing his 18th

Symphony. In England Arnold Bax has reached his Sixth and there are rumours of a Seventh.

During the year there have appeared noteworthy symphonies by Edmund Rubbra, George Dyson, and E. J. Moeran. In America symphonies have been produced, among others, by Emerson Whithorne, Samuel Barber, Bernard Wagenaar, and Anis Fuleiman. In Germany, Max Trapp has reached his Fifth. In Holland, Henk Badings is a representative symphonist. Rachmaninoff's Second Symphony was composed in 1907. Thirty years afterwards, in 1937, he produced his Third.

In most musical countries in which the form of the symphony has ever found a home, and in some others, composers have been producing symphonies with an activity unequalled since the 19th century and scarcely exceeded in its later decades. This remarkable phenomenon may be attributed in part to the magnetism of the high state of technical proficiency attained by the modern symphony orchestra, which Sir Thomas Beecham recently described as the most characteristic product of the present age in music. But in a broader sense it arises from the general reaction in favour of a return to the older forms which is so conspicuous a feature in contemporary music. To this reaction may be also attributed the feverish quest of forgotten masterpieces, the revival of symphonies by Johann Christian and Philipp Emanuel Bach, Boccherini, Clementi, and others, and the adaptation to the modern orchestra of old *concerti grossi*.

**Ballet.**—Another phenomenon is the increased interest taken in ballet, sometimes even at the expense of opera. This is conspicuous in England, but perhaps even more so in America, where new producing organizations have been formed and are still coming into existence. It is for one of these that Stravinsky wrote his ballet, *Jeu de Cartes*, produced in 1937 at the Metropolitan and since then in other countries. At Philadelphia, another concern has produced two characteristic American ballets, *Terminus* and *Barn Dance*. *Checkmate*, by Arthur Bliss, was produced by the Vic-Wells ballet while on a visit to Paris in June 1937. In the spring it had presented *The Wedding Bouquet*, a choral ballet by Lord Berners, with text by Gertrude Stein. In the winter it produced Constant Lambert's *Horoscope*. A recently formed Polish ballet visited London in the autumn with several new ballets by Polish composers. Other ballets mentioned in annals of the year are Florent Schmitt's *Oriane, la sans-égale*, Alex. Moormolen's *Diana*, Zdenek Hula's *The Blue Flower*, Vittorio Rieti's *David Triumphant*, Philippe Gaubert's *Alexandre le Grand*, Edwin Karhu's *L'Amour Triomphateur*, but it is impracticable to enumerate them all. The interest has grown to such an extent that it has been found expedient to provide a reference book describing the productions, on the lines of *The Complete Opera Book*, but although it appeared in 1937 it is already in need of a supplement to bring it up to date.

**Opera.**—In comparison, the story of opera in 1937 is less eventful, although new productions have been numerous. In Germany, for instance, six new operas were produced in the month of November alone, but only Joseph Haas' *Tobias Wunderlich* appears to have attracted much attention. Two posthumous productions, of Alban Berg's *Lulu* and of Otakar Ostrčil's *Hansens Königreich*, rank among the more important events. Other operas to be mentioned are Eugene Goossens' *Don Juan de Mañara*, Paul von Klenau's *Rembrandt van Rijn*, Othmar Schoek's *Maschmilla Doni*, Wolf-Ferrari's *Il Campiello*, Malipiero's *Julius Caesar*, Vladigeroff's *Zar Kalosan*, Josef Mandić's *Mirjana*, Bernard Paumgartner's *Rossini in Naples*, Hans Haug's *Tartuffe*, Aramir Weinberger's *Wallenstein*, Roffredo Caetani's *Hypatia*, Albert Stoessel's *Garrick*, William F. Hanson's *The Bleeding Heart of Timpanogos*, and Walter Damrosch's *The Man Without a Country*, but it would require many pages to deal with the year's

output of operas, and there is little reason to suppose that the rate of mortality among them will be any lower than in previous years. The taste in opera inclines strongly to established works. The success of the Mozart performances at Glyndebourne (Sussex) may be regarded as symptomatic. Although costly, and requiring a train journey from London, these admirable performances are so well supported that their advertisements are daily supplemented by the warning "all seats sold."

**General.**—It would be tedious to pass in review, country by country, the activities of the musical world. Those that are interpretative, from repertory seasons to the travels of famous virtuosi, have no permanent interest, and the permanent interest of creative activities needs time to assert itself. In England there has been much such activity in chamber music, revealed in new works, of which Arnold Bax's Third String Quartet is the most important. There has also been remarkable productivity on the part of women composers, characterized for the most part by what a certain writer has called that terrible masculine earnestness rarely found in man. A pang of regret was occasioned by the retirement of Lionel Tertis, the "apostle of the viola," to whose playing and teaching is due the expansion of that instrument's repertoire.

A feature in French music is the renewed interest in choral compositions, of which oratorios such as George Dandelot's *Pax* and Georges Migot's *The Sermon on the Mount*, and cantatas like Milhaud's *Cantate Nuptiale* for the golden wedding of his parents afford evidence. But this tendency has also been observed in other countries. Interesting examples are *The Glorified Kokila* by Piet Ketting, and *Jaani Tulemine* (Midsummer Night) by A. Vedro, respectively Dutch and Estonian.

Germany's music continues to be affected by political issues, the most "advanced" of her composers being forced to seek audiences elsewhere.

One of the most musically active countries has been, as usual, Czechoslovakia, but even from the smaller countries which date their existence from Versailles, such as Estonia, come reports of increased attention given to music. In some other cases there is a lurking suspicion that authorities have discovered the value of music for propaganda purposes. If only all propaganda were equally harmless.

An interesting development is the foundation, by Bronislaw Huberman, of the Palestine Symphony Orchestra at Tel Aviv. Its guest conductors have included Toscanini, Dobrowen, Dr. Malcolm Sargent, and others.

Western music is expanding in Japan, where Alexandre Tcherepnin holds an annual contest in composition. This year's winner was Akira Ifukube who is stationed in Hokkaido and self-taught, with *Bon Odori*, founded on a country dance tune. Another competition was sponsored by Joseph Rosenstock, conductor of the New Symphony Orchestra, founded 12 years ago by Viscount Hidemaro Konoye, who has recently been conducting in Europe and America. This brought to light: a Symphonic Suite by Toshiji Ogiwara; *Adagio in modo antico* by Kishio Hirao; *Four Parodies* by Shiro Fukai; *Symphonic Étude* by Bunya Koh; and a Piano Concerto by Saburo Moroi.

Musical activities have come to a standstill in war-stricken Shanghai, but in the last month of 1936 there was produced there a ballet *The Dream of Wei Lien*, by Aaron Avshalomov (born Nikolaievsk 1894), who has made special studies in Chinese music, and its use of the pentatonic scales. It was performed by a Chinese cast with the Municipal Orchestra under the composer's direction, and is reported to have been a remarkably interesting production, musically and choreographically. If possibly the Far East is here given disproportionate attention it is simply because the extension of musical activities has become coterminous with

the planet and that, in itself, is a circumstance that claims to be placed on record.

In 1937 America lost the composers Henry K. Hadley and Arthur Foote. In a different sphere the death of George Gershwin was a blow, for he had aroused definite hopes of bridging the unfortunate gulf between popular music and that of the concert-room. America also lost the two last survivors of the "old guard" in musical criticism, Richard Aldrich and W. J. Henderson.

**Mussolini, Benito** (1883– ), Italian statesman and dictator; born at Predappio, and educated at Lausanne university, entered journalism, and edited Socialist papers before the World War, in which he served and was wounded; became premier of Italy after the Fascist "March on Rome," 1922. After qualifying as an air pilot on Jan. 12, 1937, Signor Mussolini in March visited Libya to inaugurate the new strategic road driven westward along the coast from the Egyptian frontier. In June he received the Grand Cross of Hitler's recently established Order of Merit of the German Eagle. At the end of July Mr. Neville Chamberlain, the British premier, addressed a personal letter to "Il Duce" expressing his hopes for the resumption of normal and friendly relations between the two countries and the recipient replied in a like friendly strain, following up this gesture by a speech on Aug. 20, at Palermo, where he had attended the Italian naval manoeuvres, in which he asserted that a permanent reconciliation with Britain was possible, and referred to the Italian determination to keep Bolshevism out of the Mediterranean. From Sept. 24 to 29, Mussolini was in Germany, visiting the Krupp works, attending the German army manoeuvres, and conferring on Herr Hitler the title—shared only with himself—of "Corporal of Honour" in the Fascist militia. On the 28th he addressed, with the new Corporal, a large audience in the Berlin Olympic stadium. On Oct. 28, in the presence of Hitler's representative, Herr Rudolf Hess, Mussolini celebrated in his capital the anniversary of the "March on Rome" by distributing medals to the relatives of 1,790 Italian soldiers killed in the Spanish civil war, and laid stress in a speech on the growing friendship between Italy and Germany. The following day he inaugurated Aprilia the fourth town to be built on the newly drained Pontine marshes. On Nov. 20 was announced Mussolini's assumption of the portfolio of Italian Africa in his own cabinet; and his last important act of the year was to announce, in a speech at Rome on Dec. 11, Italy's decision to leave the League of Nations.

**Nahas Pasha, Mustapha** ( ?– ), Prime Minister of Egypt, is of humble parentage, started life as a telegraph clerk, but later qualified in law at Cairo and became a judge. After the World War, his activities as a Nationalist led to his deportation, with Zaghlul and others, to Malta, but his exile was brief, and he became chief Wafdist representative in Sarwat Pasha's Coalition Government, and, on Zaghlul's death in August 1927, leader of the Wafdist party. In February 1928 he successfully opposed the projected treaty with Great Britain because it did not provide for the complete evacuation of the British troops. He was premier from March to July of that year, and again for a short time early in 1930. In March 1936 he headed the Egyptian delegation to the conference that preceded the signing (August 26) of the Anglo-Egyptian Treaty of Alliance, by which Egypt attained sovereign statehood,

and in May again became premier, holding also the portfolios of the Interior and Health. In April-May 1937 he led the deputation to the Montreux Conference, and added to his popularity by negotiating the abolition of the Capitulations.

On Nov. 28, 1937, an attempt on his life was made near Heliopolis by a young anti-Wafdist "Greenshirt," who turned out to be a grandson of Arabi Pasha—whose revolt in 1882 led to British intervention in Egypt. The country was deeply stirred by the news of this attempted assassination, for Nahas Pasha is everywhere regarded as a calm and confident statesman, entirely honest, disinterested and loyal to his comrades and countrymen.

On December 30, following a disagreement between King Farouk and Nahas Pasha concerning, among other matters, a projected bill to protect the Constitution and the maintenance by the Wafdists of a "Blueshirt" army, the King dismissed Nahas Pasha together with the entire cabinet.

**National Archives,** a Federal agency of the United States created by act of Congress approved June 19, 1934. Its major objectives are: (1) the preservation in the National Archives building of all inactive records of the Government of such administrative value or historical interest that they should be permanently preserved; (2) to administer such records so as to facilitate their use by the Government and by scholars. The act provides for appointment by the President, subject to confirmation by the Senate of an Archivist of the United States and defines his duties. It authorizes him to inspect the records of any agency of the United States Government, to requisition for transfer to the National Archives such records as the National Archives Council, created by the act, shall approve for transfer, and to make regulations for their arrangement, custody, use, and withdrawal. He is authorized also to accept from non-Government sources motion pictures and sound recordings pertaining to and illustrative of American history, and to preserve them for historical purposes and study. R. D. W. Connor was appointed Archivist of the United States by President Roosevelt on October 10, 1934.

The erection of a National Archives building was first proposed by President Hayes in 1877. On December 10, in a special message to Congress, he called attention to recent fires in Government buildings which had destroyed or imperiled important public records, and recommended as a means "for securing these valuable archives" the erection of a fireproof "hall of records." Congress took no action at that time. Following similar fires in 1880 and 1881, the Senate passed a bill authorizing the erection of a hall of records, but the House of Representatives failed to act on it. For more than forty years thereafter Presidents, cabinet officials, historical and patriotic societies, and many others repeatedly urged Congress to take the necessary action. During this period bills authorizing the erection of a hall of records were introduced at every session of Congress but failed of passage. It was not until 1926 that Congress authorized the erection of a National Archives building. The cornerstone of the building was laid on Feb. 20, 1933; the building was completed on Feb. 19, 1937, at a total cost of approximately \$13,000,000. It was designed by John Russell Pope in the classical style to harmonize with the Capitol, the White House, and other buildings in Washington.

The building has a storage capacity of approximately one million cubic feet of records. At the close of the calendar year 1937 110,000 cubic feet of records had been transferred to the building. These include the files of the United States Senate through the 70th Congress, and transfers from all of the Executive Depart-

nents and many other Government agencies. Valuable documents in bad condition are protected by coating each side of the paper with cellulose acetate by means of heat and pressure.

(R. D. W. C.)

**National Congress of Parents and Teachers:** see PARENTS AND TEACHERS, NATIONAL CONGRESS OF.

**National Debts.** In all but a few instances, the year 1937 was one of increasing national debt. In the United States, the amount passed \$36,000,000,000 despite the desire of the Administration to reverse the rising trend. In Great Britain, there was little change during 1936 and early 1937, but authorization of a £400,000,000 rearmament program of which one-quarter was funded in April extended the debt beyond £8,500,000,000. Large increases also proved necessary in France, Germany and Russia, it being only in smaller countries like Austria, Hungary, Norway, Poland and Sweden where reductions were made.

There are several factors which make a comparison of national debt structures difficult. Not only must one rely on figures from Government sources which are usually interested in understating their debt burden, but one must also use exchange rates which are variable in the changing of figures so that debts may be compared. In many countries, too, a large amount of public debt is carried by localities, which while omitted in this discussion, actually adds greatly to the economic burden of many nations when compared with those where local obligations are small. Bearing such limitations in mind, however, it is interesting to compare the status of leading nations in respect to their national debt. While figures are not for the same date, they represent the general picture for the year with the translation of exchange based on the rates of Dec. 31, 1937.

The accompanying table shows that Great Britain and the United States had by far the largest debts, the former slightly exceeding and the latter rapidly approaching \$40,000,000,000. France with over \$13,000,000,000, Germany with over \$7,000,000,000, Italy with over \$6,000,000,000, and Canada, Russia and Japan with over \$3,000,000,000 each, followed. Per capita figures,

however, offer a more satisfactory method of comparing the debt burden of these countries. Thus while Great Britain and the United States have debts of approximately the same size, the individual burden in Great Britain is \$891.52 as compared to but \$281.80 in the United States. In fact despite their smaller total debts, Canada (\$340.98), France (\$311.93), and even Switzerland (\$297.36) also exceed the United States on a per capita basis. Other burdens exceeding \$200 were Belgium (\$236.90), Netherlands (\$232.81) and Australia (\$209.84). At the opposite end of the scale were Bulgaria (\$7.60), Colombia (\$13.93) and Finland (\$19.24) as well as the populous countries of China (\$2.23) and Russia (\$21.46) whose large debts were small in proportion to the number of inhabitants.

Classification of the British debt reveals that £3,519,079,197 or 44.4% was in unfunded internal obligations, £3,364,884,607 or 42.5% was funded, and the remainder of £1,032,563,090 was external. By far the largest single item was the 3½% war loan which totalled £1,911,458,825. So many changes occurred in individual items of the United States debt during the fiscal year, June 30, 1936, to June 30, 1937, that the following chart is necessary to indicate their nature:

	June 30, 1937	June 30, 1936
<i>Held Outside Treasury</i>		
Pre-war bonds . . . . .	\$ 198,000,000	\$ 200,000,000
Treasury bonds . . . . .	19,936,000,000	17,168,000,000
U.S. Savings bonds . . . . .	800,000,000	316,000,000
Adjusted Service bonds . . . . .	389,000,000	945,000,000
Treasury notes . . . . .	10,617,000,000	11,381,000,000

**National Defence:** see NATIONAL GUARD.

## National Defence Contribution.

Having come within £1,500,000 of balancing his 1937-38 budget (see BUDGET: *Great Britain*), Mr. Neville Chamberlain in England announced a new tax, the "national defence contribution," on the growth of the profits of trades. Whereas he had forecast a rising defence expenditure for the next two or three years, he purposed to borrow in 1937 the full average sum authorized to be spent out of loan for that purpose. To meet the future rise in budget expenditure, he needed "some device capable of growth in itself but easily adjustable." From current profits (less losses) would be deducted either of two standards, at the tax-payer's choice: the "capital standard," being for companies 6%, for individuals and firms 8%, on the capital employed or the "profits standard," being the average profits of 1933, 1934 and 1935.

The remainder would be taxed at a graduated rate from nil to one-third, according to the profit ratio and to its relative growth. This "special and temporary" contribution would not apply to professions or employment, or to profits below £2,000. Its estimated yield in 1937-38 was £2 millions and in a full year £25 millions to £25 millions.

The proposal provoked widespread opposition. As a result, the Finance Bill embodied a number of amendments, chiefly these: the "profits standard" would be the choice of the three best years between 1933 and 1936 or the two best between 1933 and 1935; the exemption limit of 6% under the "capital standard" would be raised in cases of exceptional risk, wastage, or deferred yield; and the scale of tax was lowered.

These and other concessions would reduce the annual yield to £15 millions.

When, however, the new chancellor of the exchequer, Sir John Simon, presented the bill on June 1, he faced such damaging parliamentary opposition that Mr. Chamberlain, now prime minister, intervened with a promise to substitute a simpler tax yielding £25 millions a year.

This new version consisted of a flat rate of tax—5% for companies and 4% for unincorporated concerns—upon all profits after deducting interest and other annual charges. Professional incomes, and profits of public utilities with statutory limitations on their prices or dividends, would be exempt, and the tax might be wholly or partly remitted in order to encourage industry to settle in the Special Areas. The contribution, accepted by Parliament in this form, was estimated to yield £25 millions in a full year, subject to proportionate loss of income tax. (H. V. H.)

THE "MYSTIC MAZE" of U.S. governmental debt, as pictured by Summers in *The Cleveland News*

Although the growth in the amount of bonds outstanding accounted for a majority of the debt increase, a considerable portion (41%) was composed of funds which while adding to the debt were paid from new and specialized sources of revenue collected for a definite purpose. The outstanding reduction was in adjusted service bonds and certificates which were paid off to war veterans at a rapid rate.

Warnings against mounting debt structures were frequent during 1937. Despite the general alarm, however, there were no important defaults, although there was considerable refunding to secure lower interest rates. Changes in the valuation of currencies of certain countries complicated the international situation and caused sudden shifts in debt interrelationships. With the business recession of the last months of the year seriously reducing incomes in many countries, there was little indication that the rising debt trend would be reversed for some time to come.

Fig. 1—DEBT OF THE UNITED STATES at various points during the formation of the government and up to the outbreak of the Civil War—in millions of dollars

Fig. 2—DEBT OF THE UNITED STATES at various dates from the Civil War to the present time. Note that in this table the columns represent billions of dollars—in the other table millions: also that the debt in 1893 was less than a billion

**National Education Association,** an association dedicated to the upbuilding of democratic civilization and supported by the loyal co-operation of the teachers of the United States "to advance the interests of the teaching profession, promote the welfare of children, and foster the education of all the people." The Association's Representative Assembly is composed of delegates from 52 state and territorial associations and 600 affiliated local units. The Association has a direct membership of about 200,000. Special branches of education are represented by 24 departments such as School Administrators, Elementary Principals, Secondary Principals, Classroom Teachers, Adult Education, and the like.

Important publications of the Association during the year were the *Journal*, a monthly periodical which goes to all members; the *Proceedings*, a 987-page report of the Association's conventions; the *Research Bulletin*; department bulletins and yearbooks; material for American Education Week; and many special bulletins and reports. The Association's winter convention was held at New Orleans in February 1937, attendance 10,000; its general convention at Detroit in late June, attendance 12,000. Three of the Association's most active committees during the year were the Educational Policies Commission, which published a 128-page book *The Unique Function of Education in American Democracy*; the Committee on the Horace Mann Centennial; the Committee on Social-Economic Goals, which issued an important report entitled *Implications of Social-Economic Goals for Education*. The Association has been active during the year on behalf of teacher welfare (salaries, tenure, retirement, and freedom of teaching) and upon the Harrison-Black-Fletcher Bill, providing substantial federal aid to general education. (See also ADULT EDUCATION.)

(J. E. Mo.)

**National Farmers' Union.** In 1936 the union, which has 130,000 members in England and Wales, took the initiative in setting up a Co-ordinating Committee with the Farmers' Unions of Scotland and Northern Ireland. It is also represented on a Standing Joint Committee with the Central Landowners' Association. The Union in 1937 accepted an invitation to send representatives to an Empire Producers' Conference, to be held in Sydney, N.S.W., in March 1938, which is to consider the question of setting up a permanent body to represent farmers' interests throughout the Empire. This is a matter of great importance in view of the Ottawa and foreign trade agreements.

The year was notable for the passing of the Livestock Industry Bill and the Agriculture Bill. In connection with the former, the co-ordinating committee of the three unions nominated Lord Bingley as representative of the interests of United Kingdom producers on the International Beef Conference and Empire Beef Council. The union set up a Diseases of Animals Committee, which will function in connection with the disease eradication program under the Agriculture Act.

The union again represented producers' interests in the negotiation of contract terms and conditions for the growing of sugar beet in 1938, and unsuccessfully opposed before the Railway Rates Tribunal the railway companies' application for a 5% increase of rates and charges. **National Geographic Society.** Organized in 1888 "for the increase and diffusion of geographic knowledge," and since 1899 directed by Gilbert Grosvenor, the National Geographic Society rounds out a half-century of noteworthy achievement in 1937. It now has a membership of 1,100,000 in all parts of the world—the largest educational institution of our time. During its 50 years the society has sent into the field numerous scientific expeditions which have made important discoveries and added substantially to mankind's knowledge of geography, meteorology, oceanography, volcanology, and allied fields. Other expeditions have brought to light chapters of unrecorded history. Narratives of these expeditions and other explorations, and its photographic surveys, are presented to the society's membership in the *National Geographic Magazine*. To form a pictorial record of world geography the society has assembled a gallery of some 250,000 photographs, many in natural colour.

During 1937 the society sent expeditions to Canton island in the Pacific ocean to observe the total eclipse of the sun of June 8 (in co-operation with the U.S. Navy); into the interior of semi-tropical Kwangsi Province, south-eastern China, to study little-known tribes and to collect plants and animals; to the Netherlands Indies to collect animals and birds; and to South Africa to study and photograph the crowned hawk-eagle and other rare birds. The society's Special Gold Medal was presented to Dr. Thomas C. Poulter for his scientific achievements as director of research of the Byrd Antarctic expedition of 1933–35. Continuing its map series the society published a map supplement of South America in ten colours and pictorial maps of the White mountains of New Hampshire and of the British Isles. The society published *The Book of Birds* in two volumes, edited by Dr. Gilbert Grosvenor and Dr. Alexander Wetmore, the first comprehensive work containing illustrations in colour of all the major species of American birds north of Mexico.

Some of the studies reported in the *National Geographic Magazine* were: Indian life in the United States by Dr. M. W. Stirling, chief, Bureau of American Ethnology, Smithsonian Institution; the Aztec Empire in Mexico, by F. H. H. Roberts, Jr., Smithsonian Institution; observations on the total solar eclipse of July 1936, in Russia, by Dr. I. C. Gardner of the National Bureau of Standards; butterfly migrations, by Dr. C. B. Williams, chief entomologist, Rothamsted Experimental Station, Harpenden, England; effect of the gulf stream on the distribution of fish life in the north Atlantic ocean, by Dr. R. W. Miner, curator of marine life, American Museum of Natural History; native customs in Uganda, by Jay Marston; new plants in the vicinity of Peking, by P. H. and J. H. Dorsett, U.S. Department of Agriculture; explorations in the Cape Horn region, by Amos Burg.

Illustrating the 54 articles published in 1937 were 1,607 photographs, 383 in colour, and 27 maps accompanying the text.

(G. Gr.)

**National Guard.** The effectiveness of the land forces of the United States was measurably increased by amendments to the National Defense Act in 1933 and 1935. This legislation conferred a certain Federal status on the National Guard of the several states by creating a new reserve component of the Army of the United States called the National Guard of the United States. At the same time provision was made for the establishment of a reserve for the National Guard called the Inactive National Guard. The creation of the National Guard of the United States makes for that speed and unity of action essential in a 20th century conflict. Thus, once the Congress has declared an emergency the President is authorized to order the National Guard into active service without further procedure of any sort.

The military advantages accruing from this change are immediately apparent when compared to the former time-consuming method. So, too, the dual status conferred upon the National Guard by this legislation obviates the uneconomic mustering out and disbandment of units at the termination of an emergency; now units merely revert to their State status when the emergency is past.

In addition to these beneficial changes, Congress has also made provision for the creation of a pool of additional officers with the view of enabling the Guard to bring its officer corps to war strength without recourse to other agencies. Other legislation has increased this component to an authorized strength of 205,000 but the funds necessary to activate the last 5,000 are not yet available. It is the intent of the War Department, however, to bring the total strength of the Guard to 210,000.

As a result of these far-seeing amendments the National Guard has become a still more formidable instrument of national defense. Today it is prepared physically, morally and materially to take its place promptly in the first line of defense shoulder to shoulder with the Regular Army. (See also ARMIES OF THE WORLD.) (A. H. BL.)

**National Income.** At the present time, because of fundamental economic and political changes being wrought throughout the world, more than ordinary interest attaches to information which permits economic comparisons of the various nations. Unfortunately, there are very few bases for satisfactory analyses. Perhaps the most comprehensive measurement of the operation of any economy is the national income. In this article an attempt is made to bring together as many estimates of national income in various countries as are available and to present the results within the limited space allotted. The gravest danger of such an undertaking is the likelihood of oversimplification.

The figures shown in the accompanying tables generally tell their own story and, therefore, the major portion of the article

will relate to the limitations of the figures. The reader is advised to give adequate consideration to these qualifications before drawing any conclusions from the tables.

In the United States estimates of the national income have been prepared with a degree of completeness and care which is equalled by few if any countries. While research in this field in Great Britain and some other countries was begun earlier than in the United States, the general absence of continuous participation by governmental or independent research agencies in these countries has delayed progress. Most of the estimates shown in Table I are unofficial and many are so lacking in comparability from one period to another as to discourage too much reliance on changes in their relative magnitudes. The inherent limitations of the various estimates may be assigned to two elements, namely, the differing accuracy of the figures themselves and differences in the concepts and scope of the estimates.

While statistical source materials in the United States and Great Britain still leave much to be desired, nevertheless, the various censuses, income tax reports, and other primary reports provide data well in advance of most other countries. Even though the income estimates are developed carefully for some nations, they might be subject to wide margins of error because of the fact that absolute figures are available for only small segments of the economy. In other countries even with fairly satisfactory primary data, the income estimates represent little more than well considered guesses. National income has been defined in innumerable ways by economists and statisticians. In the United States, estimates are presented for the national income produced which is defined as "the net value of goods and services produced," and also for national income paid out which represents "compensation to individuals for the labour, capital and management services they render." Generally, most of the estimates included herein tend to represent income produced. Differences in the scope and coverage of the various series, however, are particularly significant. Some economists still advocate the inclusion only of physical commodities and the exclusion of intangible serv-

ices in estimates of the national income. In the United States commodity producing industries contribute only half of the national income as currently measured. There are also differences of opinion concerning the inclusion of income in kind, such as commodities consumed on the farm by farm families, board and lodging furnished domestic servants, or meals supplied to restaurant employees. Certainly the exclusion of farm products consumed on the farm would markedly affect the estimates for agrarian nations. Also, imputed income from owned durable goods, such as houses, is included in some estimates and excluded in others.

Generally, the income figures include only the production of those goods and services which enter into the exchange economy. In countries where a substantial portion of the production takes place within the family unit, the estimates based only on commodities entering into market operations provide very limited comparisons with estimates of other countries. For many of the figures included in Table I it is impossible to ascertain exactly what is included and excluded, since the estimates often represent merely over-all approximations without adequate consideration of the degree of coverage.

**Price Factors.**—Of perhaps equal importance and confusion with the problems of concepts and scope are the qualifications arising out of converting the figures for different countries into the currency of one country and of the effects of differences in costs of living. National income is of necessity measured in terms of money because of the absence of any other unit for evaluating and combining various goods and services. When prices are fluctuating within a relatively narrow range, the dollar income estimates from year to year are valuable indicators of changes in real income. However, when prices fluctuate widely, unless rates of foreign exchange reflect such variations, the conversion of the estimates into dollars or pounds or any other single monetary unit introduces errors. Under a situation where there are no trade barriers and no control over foreign exchange perhaps the exchange rates would vary with price trends or vice versa, but since 1931 the changing gold or silver contents of currencies and numerous restrictions on foreign exchange have rendered almost meaningless the conversion into one currency. Therefore, it is suggested that the figures in the middle or late '20s provide a more satisfactory basis of comparison than do the estimates for recent years.

In addition to the matter of price changes and rates of exchange, it is necessary to add a word of caution in using varying per capita incomes as measures of standards of living. In the United States, per capita incomes are generally lower in the Southern States than in the North and in rural areas than in urban cen-

tres. However, these differences do not measure variations in standards of living, economic status, and general well-being. Life on farms is inherently different from that in cities and cannot be subjected to comparable measurement in terms of dollars. The same is true for different countries. The degree of industrialization and urbanization is, therefore, a significant factor in evaluating the varying per capita incomes.

**Use of the Estimates.**—As previously stated, the estimates presented are derived from a great variety of sources. These figures have been converted into dollars on the basis of average foreign exchange rates for each year and resulting per capita incomes have been obtained by dividing the best available population estimates for each year into the income totals. Figures are not available for all of the countries listed for identical years and, therefore, estimates are presented for three different periods.

In view of all of the qualifications discussed above, the reader might well question the validity of gathering together and presenting such estimates. However, while these qualifications are numerous and substantial, there are certain variations which are so marked and persistent as to allow significant conclusions. Generally, the United States, Great Britain, Canada, Switzerland and Australia appear to fall into a distinctly higher per capita income range than do the other countries and supporting general information also reveals the highest standards of living in these countries. The next income range includes Germany, France, the Netherlands, Denmark and Sweden, which again reflects what one would expect from related evidence. The smaller Central and Southern European countries are in a distinctly lower class. The extremely low income of India is probably indicative, as are those also of China and the balance of Asia. The income estimates of the U.S.S.R. are less subject of conversion into dollars than other countries but occasional dollar estimates during 1920 indicated average incomes in Russia of approximately the same level as the smaller European countries.

The figures in Table II show the recent trends in national income in those countries where continuous data are available. In the lower half of the table, the figures represent the indexes of real income insofar as the wholesale prices used to deflate the monetary incomes are representative of general price changes. Obviously, this is not entirely satisfactory. The low points of the depression and the extent of recovery vary substantially from country to country. When the indexes are adjusted for price changes, it becomes apparent that the recovery in many countries has been a pure price phenomena. Also, in some countries, particularly Great Britain and France, real income continued up throughout the period shown. However, the sensitiveness of the wholesale price indexes probably are at least partially responsible for such results.

(R. R. N.)

**National Insurance.** Industrial workers in Great Britain and Northern Ireland are more fully protected by state action against sickness, unemployment, poverty, and old age than in any other country.

The latest addition to the series of national insurance schemes is the Widows', Orphans' and Old-age Contributory Pensions Act, which operates from Jan. 1, 1938. This scheme includes black-coated workers and others of limited means of both sexes, who were not previously eligible for inclusion within manual workers' schemes. Men contribute 1s. 3d. a week for all benefits, 10d. a week for widows' and orphans' pensions only, and women 6d. for old age and orphans' pensions. Until Jan. 2, 1938, applicants were admitted up to 55 years of age; after that date the age limit for admission is 40, and contributions will be on a sliding scale according to age at entry. The main qualifying conditions for pensions are: for a widow's or orphan's pension—that 104

weeks have elapsed and 104 weekly contributions have been paid since the date of entry into insurance; for old age pension—continuous insurance for 10 years immediately before the age of 65 and payment of 260 weekly contributions. Benefits under this scheme are: widows' pensions of 10s. a week, with 5s. for the eldest child and 3s. for others; orphans' pensions of 7s. 6d. a week, and old age pensions of 10s. a week at the age of 65 for insured men and women and also for the wives of men pensioners at the same age. Income limits for entry to this scheme are £400 a year for men and £250 for women, of which up to £200 and £125 respectively may be unearned. Sir Kingsley Wood, M.P., minister of health, when introducing this scheme in the House of Commons in April 1937, anticipated that 2,000,000 persons would be concerned in this measure.

Hitherto all manual workers and non-manual workers receiving less than £250 a year, unless holding exemption certificates, have been required to take out health, pensions, and unemployment insurances. Now more than 19,000,000 persons are covered by the health and pensions sections.

The state provides part of the cost of benefits and administration of the health and pensions schemes, but the main contributions are from employers and workers. Income and expenditure of these schemes annually is:

Income	£	Expenditure	£
Contributions . . . .	28,000,000	Benefits:	
Interest . . . . .	6,000,000	Sickness . . . . .	10,000,000
Parliamentary Votes .	6,000,000	Medical . . . . .	10,500,000
		Disablement . . . .	6,500,000
		Maternity . . . . .	1,500,000
		Other . . . . .	2,500,000
		Administration . . .	5,500,000
	<hr/> £40,000,000		<hr/> £36,500,000

For the combined health and pensions schemes, men contribute 1s. 8d. weekly and women 1s. 2d.

Benefits include: sickness—men 15s., women, unmarried and widows, 12s., married, 10s. weekly; disablement benefit, men 7s. 6d., women 6s. weekly; maternity benefit, 40s. Sickness benefit may continue for 26 weeks, after which disablement benefit is payable.

**Unemployment Insurance.**—The first experimental unemployment insurance scheme was introduced in the National Insurance Act, 1911, but there was considerable enlargement in 1920, when about 11,000,000 workers were introduced to unemployment insurance.

Now there are two main sections: the general scheme, which covers 14,611,000 workers (July 1937), and the agricultural scheme, in which 600,000 land workers are insured.

Contributions, shared jointly by the State, employer, and worker, are: men 2s. 3d., women 2s., youths (18–21) 2s., and girls (18–21) 1s. 9d. Weekly benefits are: men (21–65) 17s., women 15s., youths 14s., and girls 12s., with additional 9s. for adult dependent, and 3s. for each dependent child.

In the middle of 1934 the accumulated debt of the unemployment insurance fund was funded at £105,780,000 to be repaid at £5,000,000 a year until 1971.

At the same time the unemployment insurance advisory committee, under the chairmanship of Sir William Beveridge, was appointed to advise the minister of labour on variations in the administration and allocation of the fund.

For the past three years rising employment and falling unemployment have resulted in a surplus being accumulated. At the end of 1937 this surplus amounted to £62,000,000; at the end of 1938, according to Sir William Beveridge's estimate, the surplus will be about £82,000,000.

The advisory committee makes its report on the disposal of

this surplus annually. In 1937 the minister adopted the committee's suggestion to reduce from six to three days the number of "waiting days" between the end of employment and qualification for benefit.

Towards the end of 1937 a new unemployment insurance bill was drafted. This proposes to grant to the committee powers to use any part of the fund's balance towards redeeming the debt of approximately £100,000,000 which still remains after the 1934 funding. The committee believes that a substantial repayment of the debt will reduce the annual debt charge of £5,000,000, thus releasing money for improving other conditions of the scheme including benefits.

It is expected that the committee will also consider, before announcing their 1938 recommendations, the evidence of the trade union congress in support of increased benefits to meet the rising cost of living.

Numbers supported by the unemployment insurance fund in recent years (July in each case) were: 1933, 2,508,000; 1934, 2,162,000; 1935, 1,992,000; 1936, 1,660,000; and 1937, 1,443,000. For national insurance in the United States see SOCIAL SECURITY.

**National Labor Relations Act:** see LABOUR ARBITRATION.  
**National Monuments:** see NATIONAL PARKS AND MONUMENTS.

**National Parks and Monuments.** In less than two thirds of a century a system of national parks and monuments undreamed of a century ago in any political economy has been established and developed in the United States.

The Yellowstone, the first national park, was established in March 1872. On Dec. 31, 1937, there were 142 separate areas in the national park and monument system of the United States with a total area of 17,086,671 acres. Twenty-six of these areas are national parks, areas reserved by the Congress because of their superlative scenery or some historic or scientific feature of outstanding national interest. Seventy-four are national monuments, areas established by presidential proclamation under authority of the Congress because of historic, prehistoric, or scientific interest of national calibre. In addition there are two national historical parks, 11 national military parks, eight battlefield sites, eight national memorials of various types, 11 national military cemeteries, one national parkway, and the park system of the

GOATHAUNT, most northerly camp in Glacier National Park

VISITORS TO THE NATIONAL PARKS: monthly average

National Capital, consisting of 694 separate units in and around Washington, D.C.

Congressional authority has been given to the establishment of several additional national parks and monuments when certain conditions outlined in the enabling acts, largely relating to land acquisition without cost to the Federal Government, are met. The Big Bend National park project would include the last wilderness remaining in the State of Texas. In connection with this project, the Government of Mexico is considering establishment of a park on the Mexican side of the international boundary adjoining the Big Bend region, the two forming a proposed international peace park.

The Everglades National park project in Florida would preserve an area unique in the United States in its tropical animal and plant life. The Isle Royale project in Michigan would give national park status to the largest island in Lake Superior. The Cape Hatteras National seashore project, in North Carolina, would establish the first area of this type in the system. Reservation of seashores is designed to prevent disappearance, through development, of all natural beaches. Ten national monument projects also are pending, and several parkways and military park projects.

During the travel year that ended Sept. 30, 1937, the various units of the national park and monument system of the United States were visited by 15,133,432 people. This figure does not include the millions of people who used the facilities of the national capital parks in Washington, D.C. Seven million visitors were recorded in the 26 national parks. The historical and military parks also proved exceedingly popular, showing a growing interest on the part of the people of the United States in their national history. It is the endeavour of the National Park Service, in its development of the historical segment of the park and monument system, to take in such areas of national importance as will tell the connected story of the peoples of the land from the time of the earliest prehistoric cliff dwellings to modern times.

Most of the national park and monument areas are available for use to some extent throughout the year; and many of the wilderness areas now have definite winter sports seasons. Particularly in the parks of the Cascades and High Sierra of the Pacific coast country there is unexcelled terrain for skiing.

Establishment of national parks throughout the world grew out of the example set when the Yellowstone was reserved "as a public park or pleasuring-ground for the benefit and enjoyment of the people," to quote from the act establishing it.

There are now national parks or national monuments on every continent, and in many nations throughout the world, extending from neighbouring countries in the Americas to far-off Africa.

(A. B. CA.)

**National Socialism** is the political creed (*Weltanschauung*) of Adolf Hitler's National Socialist party and the basis since 1933 of the totalitarian state of the "Third Reich." It is predicated on a racialism which aims to restore Germany to the rank of a first-rate power after the humiliations of the Versailles Treaty and after what is regarded by its advocates as the weak and corrupt "system" of the Weimar Republic from 1919 to 1933. Its doctrines are expressed in the Twenty-five Point Program of 1920, in Hitler's book, *My Battle* (*Mein Kampf*, 1925-26), and in his later speeches and decrees.

The Twenty-five Point Program of 1920 demanded: (1) the union of members of the German folk into a greater Germany; (2) the equality of the German folk with other nations, and the annulment of the Versailles and St. Germain Treaties; (3) land and soil (colonies) for the nourishment and settlement of Germany's excess population; (4) German citizenship to be limited to Folk Comrades, *i.e.*, persons of German blood, thereby excluding Jews; (5) non-citizens to be merely "guests" under special laws; (6) office-holding to be limited to citizens, and an end to the corrupting parliamentary system; (7) provision by the State for the unemployed; (8) prohibition of all further immigration of non-Germans, and immediate expulsion of all non-Germans (*i.e.*, Jews) who migrated into Germany after Aug. 2, 1914; (9) all citizens to enjoy equal rights and duties; (10) the first duty of every citizen is to be spiritually or physically productive; (11) abolition of unearned incomes, *i.e.*, the "breaking of the thralldom of interest"; (12) abolition of gains from war-profiteering; (13) nationalization of all industrial trusts; (14) generous provision for the aged; (15) profit-sharing in big business; (16) creation of a sound middle-class and immediate communalization of big department stores and their leasing on moderate terms to small concerns; (17) agricultural reform, including the expropriation of land without compensation for public welfare purposes, the abolition of land-rent, and the prevention of all speculation in land; (18) vigorous war against all those who injure the common welfare, with death for traitors, usurers and profiteers without regard to religion or race; (19) substitution of German Common Law for materialistic Roman Law; (20) free education for all gifted children and early inculcation of the conception of the State; (21) care by the State for the health of the folk through protection of mothers and children, through prohibition of child labour, through development of sports, and through support of all youth athletic organizations; (22) abolition of the professional paid army and creation of a folk army; (23) war on deliberate political lies and their circulation through the press, by provisions that all editors of German newspapers must be of German blood and that non-German papers must have the special permission of the State; (24) freedom for all religious confessions so far as they do not offend the moral feelings of the German race; the party stands for "positive Christianity" and opposes the Jewish-materialistic spirit; (25) the creation of a strong central Government in order to realize the principle, "the common good before the individual good" (*Gemeinnutz vor Eigennutz*). Although this program was declared "unalterable," a number of points have been tacitly more or less abandoned (*e.g.*, points 11-13 and 15-17, virtually calling for the abolition of the rule of capitalism), and

two (1 and 3) are still balked by international settlements. The rest of the program (except to some extent points 14, 15, 18, 23, and 24) has, however, been largely achieved. (See BROWN SHIRTS; GERMANY; GOEBBELS, JOSEF; GÖRING, HERMANN WILHELM; HITLER, ADOLF.) (S. B. F.)

## National Trust and Ancient Monuments.

The passing of the National Trust Act, 1937, in England was important for the National Trust for Places of Historic Interest or Natural Beauty. This Act extended the powers of the trust to hold properties as investments, using rents for trust purposes, and extended the purposes of the trust to include the preservation of buildings, etc., of national, architectural, historic, or artistic interest, the protection and augmentation of the amenities of such buildings, etc., and their surroundings, the preservation of furniture, pictures, and chattels having a similar interest, and the access to and enjoyment of such by the public.

A notable acquisition was the "George" inn, Southwark. Built in 1677 on the site of an older inn in whose yard Shakespeare played, the "George" is the last galleried inn in London. The ruins of Hayles Abbey, Gloucestershire, a Cistercian abbey founded in 1246, were presented in memory of Mr. and Mrs. Hugh Andrews. Other buildings acquired include the remains of a pilgrims' chapel at Dorking, Surrey, a 16th-century Flemish stone house at Tenby, Pembrokeshire, and houses with their lands in Ireland.

The Calf of Man, a 615ac. island off the Isle of Man, is to be a bird sanctuary, as is part of Groveley estate, near Birmingham, devised in memory of Major Baldwin, while the house is to be a home for poor gentlefolk. Nature reserves added to were Wicken Fen, Cambridgeshire, and Scolt Head, Norfolk. Strips of coast in Devon, Cornwall, and Pembrokeshire, woodlands in Oxfordshire, downland and hills in Gloucestershire and Surrey, were also acquired by the trust. The Scottish National Trust has acquired the Pass of Glencoe.

**Ancient Monuments.**—The preservation of ancient monuments and historic buildings in Great Britain is largely undertaken by His Majesty's Office of Works.

Work done in 1937 on prehistoric monuments included Grime's caves, an extensive Stone Age flint mine in Norfolk. Dr. Mortimer Wheeler made important discoveries while excavating Maiden Castle, Dorset. The Office of Works set up fallen stones of the circles known as "The Hurlers," Cornwall, and excavated early sites in the Orkneys. With the National Trust, the Office of Works prepared a scheme for the preservation of the Avebury monuments and their surroundings. Efforts are being made to raise the necessary money. The monuments consist of a great earthen circle with stone circles and a great avenue of stones going down to West Kennett.

**BIBLIOGRAPHY.**—J. Dixon Scott, *England under Trust* (London, 1937); Clough Williams-Ellis, *Britain and the Beast* (London, 1937). (V. R.)

**National Wealth:** see WEALTH AND INCOME, DISTRIBUTION OF.

**Natural Gas.** Production of natural gas in the United States suffered only a comparatively small reduction during the depression years, dropping from 1,943 billion cu. ft., in 1930 to 1,556 billion in 1933, and recovering to approximately the former level in 1935; in 1936 production reached 2,175 billion cu. ft., of which 30% was used in the field, 49% for industrial and 21% for domestic consumption. The largest item of industrial use is the production of carbon black, which took 13% of the total output.

The fact that much of the gas is produced from oil wells in remote regions where the consumption demand is small has led to much wastage; some 25 years ago it was estimated that the wastage was about equal to the consumed output, but since then this proportion has been much reduced, chiefly through more economical methods of handling, pumping the excess back into the ground for storage or re-pressuring the well, and most of all, by the construction of distribution lines to carry the gas to consumption centres far removed from the point of production. About one-quarter of the present consumption is now carried through long-distance pipe lines; some of the more striking ones are a line from the Texas panhandle to Detroit, Mich., and intermediate points, and one from Kentucky to Washington, D.C. (G. A. Ro.)

**Natural History Museums.** In 1937 many signs pointed to a gradual transformation of natural history museums by which they may become fully accredited parts of the educational system in every civilized country. They always have been adjuncts to general education and always have had a basic, vital relation to scientific research; but it is only recently that they have reached out to a broad public which by quick response has stimulated them to greater effort. The change began scarcely more than 30 years ago with the improved techniques centring around the so-called "habitat group." With its combination of art and nature in exquisite reproductions of both animals and plants, this introduced a new feature which by sheer beauty attracted a larger public and larger financial support. The habitat group has come to stay, but its heyday is passing and not improbably it will prove to be a link between the museum of the past, which was mainly objective, and the one of the future, which will doubtless be much more subjective.

The spread and growth of museums has continued. New museums are being established in small or medium-sized communities and old ones are being expanded everywhere. Museums to meet special conditions also have multiplied. Such are the "trailside" museums and the park museums. A highly specialized museum is a Speleological museum planned in Cragdale Settlement, England. In State and national parks there are now more than 50 special museums in various parts of the United States. A unique and stupendous undertaking under museum auspices is the Dinosaur National Monument in Utah where the remains of huge, extinct reptiles are to be shown *in situ*.

In the British Empire, museums have been greatly stimulated by the Carnegie United Kingdom Trustees administering funds provided by the Carnegie Corporation. Beginning in 1931, they have not only fostered study of museum methods throughout the world, but also have judiciously allotted grants in relatively small amounts for many specific purposes. Such grants have put new life into many a museum, have awakened it to new possibilities, and have placed it in a new light within its community.

The growth of museums in Soviet Russia has been phenomenal and but little known to the rest of the world. According to an authoritative report there are now at least 738 Soviet museums as against only 115 before the revolution. The number in Moscow has increased from 47 to 129. Not all are natural history museums, but those wholly or partly devoted to natural science constitute 51% of the total as compared to a former 8.8%. Many are so-called museums for regional study, closely connected with the schools, and definitely anti-religious in outlook.

In changing from a somewhat static but assured existence to a dynamic one with large future potentialities, museums are encountering many problems. Co-operative movements and numerous museums associations are attacking these problems. At the meeting of the British Museums Association in 1937 the

rector of the American Association was present to deliver an address and offer exchange of ideas. An exhaustive treatise on museum methods came from Germany and the Scottish Federation of Museums held its first meeting in October 1937. Japan is a flourishing association and there is even one in China which entered its second year in 1937.

Under the new conditions, the responsibilities of large, long-established museums have reached proportions taxing their capacity. Such museums are called upon both for elementary popular science and for advancement of knowledge. Some help is obtained by close contacts with universities, but it is evident that the museums, with their relatively small staffs, are at a disadvantage. The type of research for which museums are especially fitted is obviously in need of special endowment. The small museum can limit its field and lean upon the large one in many ways, but the large one must carry on all its earlier functions as well as the new ones. To do this, it must enlarge its personnel and recognize new professional status to meet new conditions. It has always been self-evident that a museum is no better than its curators. Today, as one writer has said, "the curator must be not only a man of science in the widest sense, but a man of action." Such requirements are not easily met and it is often necessary to sacrifice science for action and vice versa. Given the means, men for science and others for action might find their places, but some degree of compromise seems inevitable. It is not strange, however, that more than one supposedly rich institution is campaigning for new endowment.

Museums have been quick to utilize the radio, especially those with large staffs able to speak authoritatively and to command public attention. In London, the Natural History Museum has conducted programs in co-operation with the British Broadcasting Corporation and the Central Council on school broadcasting. The American Museum of New York and the Smithsonian Institution in Washington have done much broadcasting. The former recently had a series called "This Wonderful World," offering prizes and featuring questions and answers on natural history subjects. The Field Museum of Chicago, for several months during the summer of 1937, conducted weekly broadcasts in which museum activities, especially expeditions were dramatized. (W. H. O.)

**Naval Limitations Conference:** see LONDON NAVAL CONFERENCES.

## Navies of the World.

At the end of 1937 every navy of importance in the world was taking measures to increase its strength. Though this applies more particularly to the seven principal Powers—the United States of America, the British Empire, Japan, France, Italy, Germany, and Russia—it holds good also for most of the minor ones.

All seven of the above Powers are building new capital ships, a fact which goes far to discount exaggerated claims by air enthusiasts as to the ability of air forces to influence naval strategy. As far as details of the designs of these new capital ships have been published, certain features appear to be common to all; displacement is largely owing to the standard displacement of 35,000 tons having been more or less generally adopted. On this displacement, possibilities in the way of novelty in design are strictly limited, if adequate protection, reasonably high speed, and good sea-keeping qualities are to be obtained.

The aircraft carrier, whose relative vulnerability caused some critics to assume that its day was done, figures in the building programs of all the above Powers with the exception of Italy; and it would not be surprising if the Italian Naval Staff were to

arrive at the conclusion that aircraft carriers will be needed in the future.

Torpedo tubes as part of the armament of capital ships, or of heavy cruisers, have fallen out of favour. Not only are they excluded from all the designs of new capital ships so far published, but they are being removed from many of the capital ships, and heavy cruisers that have been taken in hand for refit or reconstruction.

Increased deck protection against plunging fire or air bombs is a feature found in all the new designs of capital ships and heavy cruisers, in combination with enhanced anti-aircraft armament and the addition of aircraft and catapults to their equipment. With higher steam pressures and boilers of improved design, space and weight have been made available for these additions, which would have been difficult to provide otherwise.

Efforts to abolish the submarine as a weapon of war have been utterly fruitless, and more submarines are now under construction than ever before. Another type of warship which is being built in large numbers is the motor torpedo boat, the value of which for coastal operations was proved in 1918-19, though for many years the type was neglected in nearly every navy. One of its attractions is that it can be built quickly and cheaply.

Destroyers have altered less than any category of warship since the Armistice; but even here, increased steam pressures and modified boiler design have enabled certain improvements to be made. Of late, there has been a tendency in several navies to reduce the number of funnels to one; instances of this will be found in the United States, British, Italian, and Polish fleets.

**United States.**—After a quiet period, the United States Navy is also beginning to expand again. Its strength at the end of 1937 included: 15 battleships; 3 aircraft carriers; 17 cruisers with 8-in. guns; 12 cruisers with 6-in. guns; 196 destroyers; 84 submarines; 11 gunboats; 33 patrol vessels; 3 aircraft tenders; 10 minelayers; and 43 minesweepers. Under construction, or to be begun early in 1938, were: 4 battleships; 3 aircraft carriers; 8 cruisers; 38 destroyers; 22 submarines; 1 aircraft tender; and 2 motor torpedo boats, the first to be built for the U.S. Navy. The total personnel amounts to 119,992.

**Great Britain.**—During the period covered by the currency of the Washington Treaty of 1922 and the London Treaty of 1930, British naval strength declined sharply, both in material and personnel. This fact was not fully realized by the nation at large until it was brought home to the public by the Abyssinian crisis of 1935. Since that date large and increasing programs have been introduced each year, a course rendered possible by the automatic termination of the two treaties already referred to at the end of 1936.

At the end of 1937 the British Fleet comprised the following warships: 12 battleships; 3 battle cruisers; 15 heavy cruisers, mounting 8-in. guns; 42 cruisers with 6-in. guns; 2 anti-aircraft cruisers; 1 cruiser-minelayer; 5 aircraft carriers; 162 destroyers; 52 submarines; 33 escort vessels; 33 minesweepers; 6 patrol vessels; 3 aircraft tenders; 2 netlayers; 18 river gunboats; 5 coastal minelayers; 10 motor torpedo boats; and 3 monitors. In addition, there were under construction or authorized: 5 battleships; 17 cruisers; 5 aircraft carriers; 40 destroyers; 18 submarines; 4 escort vessels; 7 minesweepers; 5 patrol vessels; 3 river gunboats; 2 coastal minelayers; and 13 motor torpedo boats. It will be appreciated from this that a very large expansion of material strength is in progress, though the more important units will not be ready until 1940-41. To man the additional tonnage under construction, corresponding increase is being effected in the numbers of officers and men, largely by entering cadets and boys, but also by direct entry of officers from the Royal Naval Reserve and of men from civil life. The 1937 navy estimates provided for

a total personnel of 112,000, as compared with the low-water mark of 90,300 touched in 1933. At the outbreak of the World War in 1914 this total was 151,000.

A number of the British Dominions overseas maintain local naval forces. These include the Royal Indian Navy, with 5 escort vessels, a patrol vessel, and some minor craft; the Royal Australian Navy, with 4 cruisers, a flotilla leader, 4 destroyers, 2 escort vessels, a seaplane carrier, and 4 other ships; and the Royal Canadian Navy, with 4 destroyers, and 4 vessels of less importance. For comparative purposes ships of these navies have been incorporated in the total strength of the British Empire's fleet, summarized in the preceding paragraph.

The Dominion of New Zealand maintains two or three small craft for training its naval personnel. Two cruisers are lent to the Dominion from the Royal Navy, in addition to a couple of escort vessels stationed in New Zealand waters.

**Japan.**—Third in strength of the great naval Powers, Japan also enjoys a unique geographical position, which adds greatly to the strategical value of her fleet. Its strength at the end of 1937 included: 9 battleships, together with a demilitarized battleship which it has been proposed to rearm; 5 aircraft carriers; 12 cruisers with 8-in. guns; 23 cruisers with 6-in. guns; 5 old cruisers rated as coast defence ships; 105 destroyers; 12 torpedo boats; 3 submarine chasers; 60 submarines; 3 aircraft tenders; 11 minelayers, and 9 gunboats. Full information as to ships under construction in Japan is not available, but it is believed that three battleships, armed with 16-in. guns, were put in hand at the end of 1937. Otherwise there are known to be building: 1 aircraft carrier; 2 cruisers; 10 destroyers; 8 torpedo boats; 3 submarine chasers; 2 submarines; and 2 aircraft tenders. Probably the actual numbers under construction are greater than these figures. The total personnel amounts to 107,000.

**France.**—At the end of the World War French naval strength had declined appreciably compared with that of most of her allies. But of late years determined efforts have been made to regain lost ground, and the French Navy now includes: 6 battleships; 1 aircraft carrier; 7 cruisers with 8-in. guns; 12 cruisers with guns of lighter calibre; 60 destroyers, many of which are of between 2,000 and 3,000 tons displacement, virtually small cruisers, in fact; 11 torpedo boats; 75 submarines; 2 minelayers; 1 netlayer; 1 aircraft tender; 44 escort and patrol vessels; 4 minesweepers; 13 submarine chasers; 9 river gunboats. Under construction or to be laid down shortly are: 3 battleships; 2 cruisers; 16 destroyers; 6 torpedo boats; 16 submarines; 4 aircraft tenders; 19 escort and patrol vessels; 18 submarine chasers; and 1 river gunboat. Of late the rate of construction has slowed down considerably, and some ships have been completed long after their due dates. The total personnel is 69,500.

**Italy.**—With the Fascist régime the Royal Italian Navy has undergone a combined process of expansion and renovation. It now includes: 4 battleships of pre-War construction, 2 of which have been completely rebuilt, while the other 2 are being similarly dealt with; 7 cruisers mounting 8-in. guns; 15 cruisers with lighter weapons; 1 obsolete cruiser used for training purposes; 64 destroyers; 60 torpedo boats; 86 submarines; about 100 motor torpedo boats; 1 escort vessel; 1 aircraft tender; 15 minelayers; 38 minesweepers; 14 gunboats; and 5 monitors. There are under construction 4 battleships of 35,000 tons; 24 destroyers; 16 torpedo boats; 20 motor torpedo boats; and 20 submarines. More submarines and small craft will be begun in 1938. It will be observed that the tendency is to build torpedo craft and submarines in large numbers, and it will not be long before Italy leads the world in the number of these vessels, though at the moment Russia probably holds that distinction. The personnel numbers 67,803.

**Germany.**—Since Germany decided to depart from the restrictions imposed by the Treaty of Versailles, the expansion of her Navy has been spectacular in its rapidity. It now includes the following warships, almost all built within the past few years: 3 armoured ships, the so-called "pocket battleships," which are actually big armoured cruisers of an exceptionally powerful type; 6 cruisers; 8 destroyers; 18 torpedo boats; 14 motor torpedo boats; 36 submarines; 2 gunnery training ships; 10 patrol vessels; and 23 minesweepers. Either under construction or to be laid down early in 1938 are: 5 battleships; 2 aircraft carriers; 2 cruisers armed with 8-in. guns; 4 cruisers with 5.9-in. guns; 12 destroyers; 18 torpedo boats; 6 motor torpedo boats; 25 submarines; and 24 minesweepers. Equally rapid has been the increase in personnel, which in 1937 totalled 46,600. A very large proportion of this total must still be under training.

**Russia.**—Exact information about the Soviet Navy is very hard to obtain, but the figures given here are as trustworthy as can be procured. The strength in completed ships is believed to be: 3 battleships, of an old type; 3 modern cruisers and 2 old ones used for training; 1 cruiser-minelayer; 20 destroyers; 18 torpedo boats; 130 motor torpedo boats; 113 submarines; and a large but somewhat uncertain number of small minelayers and minesweepers. Under construction are: an aircraft carrier, at least 2 cruisers, 5 or more big destroyers, about 36 submarines, and a number of motor torpedo boats. In 1938 it is intended to start the construction of one or more battleships. The total personnel is not known, but was reported some time ago at 23,600; it has since been increased.

It may be asked, why are all the great nations increasing their naval armaments? Except in the cases of France and Germany and Germany and Russia, it is not a matter of direct competition. Nowadays no thinking person in either the United States or Britain seriously regards the other country in the light of a possible opponent, since the ideals of both are similar, and it is hard to envisage any disagreement serious enough to bring armament into question. But in nearly every country there is a growing sense of insecurity owing to the troubled state of world politics which has led to a universal demand for stronger defences.

That this is so is proved by the attitude of the smaller countries. The Netherlands, a peace-loving nation which is not easily stirred, has embarked on its biggest naval program for many years. Its existing fleet comprises: 3 cruisers; 2 old coast defence ships; 8 destroyers; a dozen old torpedo boats; 22 submarines; 3 escort vessels; 10 minelayers; and 16 minesweepers. There are under construction, or to be built immediately: 2 cruisers; 4 destroyers; 9 submarines; a gunnery training ship; 3 escort vessels; a minelayer; and a number of motor torpedo boats. Concern is felt for the safety of the vast Dutch possessions in the East Indies, which, it is felt, are but inadequately protected by the existing fleet.

The Scandinavian countries are fully as peace-loving as the Netherlands, and are not easily disturbed by wars and rumours of wars. But the Swedish commander-in-chief has recommended quite a formidable program to Parliament, for the construction 1938-43, of three 8,000-ton armoured cruisers; 4 torpedo boats; 3 submarines with a parent ship; and 12 motor torpedo boats. This is a big increase on the present fleet of 2 cruisers; 8 coast defence ships; 14 destroyers; 16 submarines; 6 minesweepers; and 7 motor torpedo boats. It is possibly the growing strength of the German and Russian Navies that Sweden fears, but general uneasiness at the world situation is probably an equally contributory cause.

Norway has not yet introduced any fresh program, but it is only a question of time before the increasing number of advocates of rearmament in that country will find their demand met. At present

U.S. aircraft carrier "YORKTOWN," commissioned Sept. 30, 1937

The "POMPANO," U.S. Navy submarine, commissioned June 12, 1937

ANTI-AIRCRAFT GUN in action on board H.M.S. "Courageous"

Heavy cruiser "VINCENNES," U.S. Navy, commissioned Feb. 24, 1937

The "GRIDLEY HULL," U.S. destroyer, commissioned June 24, 1937

ent the fleet includes: 4 coast defence ironclads; 21 torpedo boats; 9 submarines; and 4 minelayers, the majority being old ships. Four torpedo boats and two minesweepers are building or authorized.

Denmark is at much the same stage as Norway. To a fleet of 2 coast defence ships, 20 torpedo boats, and 8 submarines, there will soon be added a minelayer; 3 submarines; and 3 minesweepers.

As a new country, Finland has a small but modern fleet, which comprises: 2 coast defence ships; 5 submarines; and 4 gunboats, besides smaller craft, such as motor torpedo boats and coastal minesweepers. A new construction program is at present under consideration.

Poland, another new country, is steadily building up a navy of considerable importance. It now includes: 4 destroyers; 3 submarines; 5 torpedo boats; 2 gunboats and 4 minesweepers. A minelayer and two submarines are building, and it has been proposed that an extensive program, to include capital ships and cruisers, shall be put in hand in the near future.

The Estonian Navy is small but quite efficient. It includes: 2 submarines; a torpedo boat; 4 minelayers; and a number of smaller craft. It is intended to add a flotilla of motor torpedo boats to the fleet next year. Latvia's force of 2 submarines, 2 minesweepers, and a gunboat is still smaller, while Lithuania has only a single patrol vessel. Both these countries are discussing extensions of their naval forces.

In the south of Europe, the Spanish Navy is divided into two opposing sections. Disregarding this, there are: 7 cruisers; an old battleship which is at present completely disabled; 15 destroyers; 11 torpedo boats; 11 submarines; 2 minelayers; 5 gunboats; and many smaller vessels. Two destroyers, three submarines, and four minelayers are under construction.

Portugal has a small but highly efficient fleet, which has been modernized in recent years. There are: 6 destroyers; 8 escort vessels; 2 torpedo boats; 3 submarines; and 3 gunboats. A new program is being framed in 1938 with the help of British naval advice.

Greece possesses an old armoured cruiser; a cruiser-minelayer; 8 destroyers; 13 torpedo boats; 6 submarines; 4 small minelayers; and 2 motor torpedo boats. Two destroyers are under construction in British yards, and 10 more destroyers and 2 submarines are to be begun within the next two or three years.

Turkey's biggest ship is still the "Yavuz," formerly the German battle cruiser "Goeben," which was modernized a few years ago. There are: 4 destroyers; 5 submarines; 2 old cruisers; 11 motor torpedo boats; and sundry vessels of less importance. Under construction are: 4 submarines, and a number of motor torpedo boats, while 2 cruisers and 4 destroyers are projected.

Rumania has 4 destroyers, a submarine, 3 old torpedo boats, and some minor war vessels. Additions to this force are at present under consideration. Bulgaria has nothing but 4 small torpedo boats of an obsolete type.

The Royal Yugoslav Navy is a growing force, with the flotilla leader "Dubrovnik" as its flagship. There are: 4 submarines; 6 torpedo boats; 10 motor torpedo boats; an old cruiser; an aircraft tender; and 11 minelayers, while 3 destroyers are under construction.

**South America.**—In South America, after a long period of quiescence, there is a general disposition to bring fleets up to date in conformity with the world impulse already noticed.

The Argentine Navy at present comprises: 2 battleships; 2 cruisers; 4 coast defence ships; 9 destroyers; 3 submarines; and 10 patrol vessels. Under construction in England are a cruiser and 7 destroyers, while 7 patrol vessels are being built in Argentine yards—quite a new departure.

Brazil is also taking steps to increase her navy. To the existing force, which includes 2 battleships, 2 cruisers, 8 destroyers, and 4 submarines, there are being added 9 destroyers, 6 of which will be built in England, and 6 minelayers which, like the other 3 ships, are under construction in Brazil. Both battleships are being reconstructed.

Chile, which in the efficiency of its fleet has always taken a very high place, recently obtained tenders for the construction of two new cruisers. Otherwise her navy consists of a battleship, the "Almirante Latorre," which fought in the British Grand Fleet during the World War as H.M.S. "Canada"; 3 cruisers, a coast defence ship, 8 destroyers, and 9 submarines. Financial conditions alone have hindered the earlier renewal of the Chilean fleet.

Peru possesses 2 cruisers, 2 destroyers, 4 submarines, and a torpedo boat. Frequent changes of Government have hitherto prevented new programs of construction from getting beyond the paper stage. In the case of Ecuador, a similar situation prevails, except that the whole fleet at the moment consists of the gunboat "Presidente Alfaro."

Colombia has recently built up a small but efficient navy with the aid of British officers and instructors, there being 2 destroyers, a minesweeper, and a number of gunboats and patrol vessels. Venezuela possesses half-a-dozen gunboats; Uruguay, 3 patrol vessels, and several other small craft; and Paraguay, 4 river gunboats.

Farther north, Mexico can dispose of 5 modern escort vessels and 2 old ones, a coast defence ship, 10 gunboats, and 4 patrol vessels. Cuba has 2 escort vessels, recently rebuilt; 5 gunboats, and 7 patrol vessels. Haiti has 2 little patrol vessels.

One of the outstanding features of these South American, Central American, and West Indian Navies is that, with the exception of Argentina and Brazil—and those to a limited extent—none can build ships at home, so that orders have to be placed abroad.

This also applies to three Eastern Navies, the existence of which is sometimes almost forgotten. Two have built up new fleets under the tutelage of Japan, and the third is doing the same under the guidance of Italy.

The Navy of Manchoukuo, though mainly a river force, includes 15 gunboats, all but 5 of which are modern vessels built in Japan, as are 6 patrol vessels which are also included in the fleet. A destroyer and several other vessels of less importance exist, though full particulars of these are not available.

Though little advertised, the recent rapid expansion of the Royal Siamese Navy is a remarkable feature for which no obvious explanation is forthcoming. It has more than trebled its strength in a little over two years, and now comprises: 2 coast defence ships built and 2 building; a destroyer; 18 torpedo boats and 4 submarines; 2 escort vessels; 3 gunboats built and 2 building; 2 or 3 minelayers; and 8 motor torpedo boats. With the exception of the minelayers and 10 torpedo boats, which were built in Italy, the whole of the new construction has been undertaken in Japan.

Iran is the third country to develop, under foreign inspiration, a navy from next to nothing. In the place of one or two old vessels of no fighting value, the Imperial Iranian Navy now includes: 7 gunboats, half a dozen motor torpedo boats, and one or two ancillary vessels. Personnel for these ships, as in the case of Siam and Manchoukuo, has been trained under officers from the country supplying the ships—in this case, Italy.

Iraq, the neighbour of Iran, has begun to build up a little navy, its nucleus having been formed with 4 patrol vessels, a yacht, and a tug, all British built.

Of the Chinese Navy it is difficult to say anything at the moment, since it has suffered heavily from the onslaught of Japan.

Before hostilities began, its force was considerable, including: 8 cruisers, an escort vessel, over 20 gunboats, 6 old torpedo boats and 10 of the modern motor type, 16 river gunboats and patrol vessels, and a couple of small seaplane carriers. Several of these ships have been sunk, or, in the case of a comparatively new cruiser, the "Ning Hai," taken possession of by the Japanese forces. This is no reflection on the bravery or efficiency of the Chinese personnel, which was completely overwhelmed by superior strength.

Until the issue of the present struggle in the Far East is finally determined, it is hard to forecast the future of the Chinese Navy; but if an independent Chinese Government survives, it may be taken as a certainty that a new fleet will in due course be provided.

There are of course several countries whose naval forces are either non-existent at present or of too small importance to be worth counting in world affairs. Czechoslovakia, Austria, and Hungary all maintain river forces with semi-military personnel, which are navies in a sense. In the case of Czechoslovakia the strength of this force has been more than doubled recently, a significant commentary on the unsettled state of Central Europe at the present time. Austria actually went to the length of disbanding its force and selling the ships some years ago, but has since reconsidered matters and reconstituted it with fresh craft.

That for some years to come the development of the world's navies will provide a steady source of income for shipyards and a subject for discussion everywhere seems to be certain. That it will lead to another World War by no means follows, for it is a characteristic of naval armaments that, provided the preponderance of strength lies in the hands of peace-loving countries, they can be used to the greatest advantage as a means to restrain aggression. (See also MUNITIONS OF WAR; WARFARE; WORLD ARMAMENTS.) (F. E. McM.)

**Navy Department:** see GOVERNMENT DEPARTMENTS AND BUREAUS.

**Nazis**, a popular and convenient but slightly derogatory abbreviation for members of the National Socialist party led by Adolf Hitler since 1920. According to some writers it arose during the early days of the party as a derisive nickname from a local Bavarian slang expression meaning mountain country-bumpkin or "hill-billy." More probably it arose from the German pronunciation of the first two syllables (*Nati*) of its long official name—*National sozialistische Deutsche Arbeiterpartei* (National Socialist German Workers' party), just as the members of the Social Democratic party used to be known as *Socis*. The official abbreviation, commonly used by German writers is "NSDAP," these being the initial letters of the five combined words of its full name. (See BROWN SHIRTS; DANZIG; GERMANY; NATIONAL SOCIALISM.) (S. B. F.)

**Nebraska**, one of the States formed from the Louisiana Purchase; area, 76,808sq.mi.; population, 1930, 1,377,963, estimated July 1, 1937, 1,364,000; capital, Lincoln, 75,933. The largest city is Omaha, 214,006. In 1930, 54.9% of the population was urban; 1,353,702 were white, 13,752 coloured, 1,262,517 native-born and 115,346 foreign-born.

**History and Government.**—The executive power is vested in the governor and eight other administrative officers. The governor prepares the biennial budget, has a considerable appointing power, and a veto power which extends to items in appropriation bills. The principal State officers for 1937-39 were Governor, R. L. Cochran; Lieutenant-Governor, Walter H. Jurgenson; Auditor, William H. Price; Secretary of State, Harry R. Swanson;

Treasurer, Walter H. Jensen; Attorney-General, Richard C. Hunter; Superintendent of Public Instruction, Charles W. Taylor. The legislative power is vested in a single chamber of 43 members, known as the Senate. Senators are elected for single-member districts on a non-partisan ballot for a term of two years. The lieutenant-governor is the presiding officer, though a speaker acts in his absence. Regular sessions are biennial in the odd-numbered years, though special sessions may be called either by the governor or by two-thirds of the membership. The judiciary consists of justice, police, municipal and county courts in the localities and of 18 district courts and a supreme court of seven members. The county courts are engaged primarily in probate work. All judges are popularly-elected, county and district judges for four years and supreme court judges for six years.

**Education.**—Higher education is supported by the State at the University of Nebraska and in four teachers' colleges. The State university consists of ten colleges and three schools of collegiate grade. The total enrolment for 1936-37 exceeded 10,000 of whom more than 6,500 were resident students of collegiate rank. Property and equipment are valued at \$11,700,000 and the biennial appropriation for 1937-39 was \$6,773,762 (including Federal grants). The management of the university is vested in an elective board of regents. The four teachers' colleges offer collegiate training for four years leading to a bachelor's degree. The total enrolment in 1936 was 5,678 and the faculties number 226. Control is vested in a board of seven members. Elementary and secondary education is in the hands of local school districts of which there are now more than 7,000 in the State. Financial support is derived almost wholly from the local tax on property. The total enrolment in 1936 was 307,975 and the number of teachers employed was 17,519. School property was valued at \$82,145,727, school expenditures were \$17,175,354 and school indebtedness amounted to \$29,829,857.

**Charities and Corrections.**—The dependent, delinquent and defective classes are cared for in 18 institutions under the supervision of the State Board of Control. In addition to the penitentiary and reformatories for men and women, there are industrial schools for boys and girls, hospitals for the blind, the deaf and the feeble-minded, three hospitals for the insane, two homes for soldiers and sailors, an orthopaedic hospital and a home for dependent children. The total institutional population in 1937 was 8,942 and the legislative appropriation, \$4,832,222. In addition there is an appropriation to the State assistance fund for the biennium 1937-39 of more than \$7,000,000. This fund is administered by a State assistance director in co-operation with the county boards.

**Banking and Finance.**—State banks under the supervision of the State banking department numbered 296 on June 30, 1937—a decrease from 415 in 1933. These banks have resources of \$82,748,259. There were also

ROBERT LE ROY COCHRAN, governor of Nebraska

76 building and loan associations with resources of \$65,852,076 and 167 co-operative credit associations with assets of \$2,477,268. National banks at the same date numbered 127 with resources of \$101,000,000.

The total assessed valuation of the state for tax purposes is \$2,060,835,168. The tax rate for state purposes for 1937 is set at 2.64 mills, which is calculated to produce \$5,429,100. The biennial budget for 1937-39 carried appropriations of \$56,365,788, of which about \$15,000,000 are Federal funds. The chief sources of state revenue, aside from the direct tax on property, are the tax on gasoline, motor vehicle licences, taxes on liquors and miscellaneous fees and licences. There is no state tax on personal or corporate incomes or on sales. The inheritance tax is collected by the counties. The state has no debt, though that of the local subdivisions in 1937 amounted to \$79,000,000.

**Agriculture and Manufactures.**—Nebraska is an almost purely agricultural state and its chief products are from the soil. Its most valuable products are cereals and livestock. The normal production of corn is nearly 250,000,000 bu. and of hogs more than 5,000,000 annually. Other important crops are wheat, oats, hay, potatoes and sugar beets. The total cash farm income in 1937 was \$252,600,000 including Government payments of \$17,425,000. One-fourth of this came from crops, three-fourths from livestock.

The chief industries of the state are connected with the processing of farm products. The principal industry is meat packing which employs about 15,000 persons in Omaha and has an annual payroll of nearly \$15,000,000. Next in order of their importance come the processing of milk, flour, feed and mill products; car and car repairing, and such minor industries as confectionery, leather and harness, lumber and millwork and concrete products. In 1935, 54,212 persons were gainfully employed in manufacturing and the value of manufactured products was \$209,384,111. (L. W. L.)

**Necrology:** see OBITUARIES.

**Negroes (American).** Negro share-croppers and tenants under Federal Resettlement and Farm Security plans shared land settlement in North Carolina, Alabama, Mississippi and Arkansas. The Southern Tenant Farmers Union with white and Negro members held its annual meeting at Muskogee, Okla., reporting 150 white and Negro delegates. The president's Farm Tenancy Commission had two Negro members and recommended Federal land purchase and settlement for white and Negro tenants and share-croppers, but this feature was omitted from Farm Security Act passed by Congress.

Negro industrial workers shared largely in organization of workers in steel, garment, and to some extent automobiles, under the Committee for Industrial Organization and as members and officials of United Mine Workers of America they furnished support and leadership in this new labour movement. Racial discrimination in unions was discussed at Fifty-seventh Convention of A.F. of L. in Denver, Colo., in October. Pullman Company officials conferred with representatives of the Brotherhood of Sleeping Car Porters, an affiliate of A.F. of L. led by A. Phillip Randolph, and under auspices of the U.S. Mediation Board signed an agreement August 25.

Improved housing for Negroes was greatly advanced by the opening of the Harlem (N.Y. city) river houses for 574 families; also University homes at Atlanta, Ga., and other projects including Atlantic City (N.J.), Jacksonville (Fla.), Louisville (Ky.), and Montgomery (Ala.). Negro sufferers in Ohio, Arkansas and Mississippi river flood districts reported being given fair treatment by the American Red Cross. In Louisville, Ky., the mayor appointed a leading Negro citizen to his Emergency Flood Com-

mittee.

**Civic.**—President Roosevelt nominated (February 4) W. H. Hastie, Harvard law graduate, U.S. District Judge in the Virgin islands; confirmed by the Senate; he was the first Negro on the Federal bench. Negro woman lawyer, Eunice Hunton Carter, was the only woman appointed with 15 men on Dewey's anti-racket staff, New York city, and was later named assistant on the district attorney staff after Jan. 1, 1938. The first Negro woman was appointed to Baltimore, Md., police department.

U.S. Supreme Court freed (April 15) Angelo Herndon from eighteen to twenty-year sentence to Georgia chain gang after six-year court struggle. Four of nine Scottsboro boys accused since March, 1931, of rape of two white women near Scottsboro, Ala., freed week of July 24 from Alabama prison with same indictment on which other five were sentenced: one to death and others to terms of years. The cases of the two who were sentenced had been reversed twice by the U.S. Supreme Court; one conviction had been reversed by the Alabama trial judge. The U.S. Supreme Court, October 24, denied a petition of one defendant for review of seventy-five year sentence. (See also SCOTTSBORO CASE.)

U.S. House passed Gavagan anti-lynching bill 277-119, April 15, 1937. The Senate advanced the Costigan-VanNuys anti-lynching bill to second place on the calendar where after an extended filibuster in the December special session it was fixed for order of day Jan. 6, 1938, at the regular session. Public opinion poll showed about 70% of the nation favoured legislation including 65% in the South. Tuskegee institute announced for 1937 eight lynchings, all Negroes, one less than 1936; in Alabama, 1; Florida, 3; Georgia, 1; Mississippi, 2; Tennessee, 1. The two victims in Mississippi were tortured with blow torches.

**Education and Art.**—Dr. Rufus Clement, dean of Louisville (Ky.) Municipal college for Negroes, was elected president of Atlanta university, succeeding the late Dr. John Hope. *The Crisis*, Negro magazine, estimated for the school year 1936-37, an enrolment of 22,045 students in Negro colleges and universities with 2,241 graduated with bachelor degrees; in mixed colleges and universities 1,902 Negroes with 130 graduated with bachelor's and 8 with Ph.D. degrees. The Maryland legislature abolished former differences and equalized by law school terms for white and Negro children. The Second National Negro Congress, about 1,200 delegates, at Philadelphia October 14-16, heard white and Negro civic and economic leaders and held three large mass meetings. A National Conference on Problems of the Negro and Negro youth, sponsored by the National Youth Administration, Mary McLeod Bethune, chairman, was held in Washington, D.C. January 6; it asked legislation for greater economic security among Negroes removal of colour bars in employment, adequate medical and educational facilities, free use of ballot and remedy for farm tenancy. Walter White, secretary, National Association for the Advancement of Coloured People, was awarded 23rd Spingarn Medal for distinguished achievement by American Negro. A blind Negro girl won an essay contest of public and parochial schools in New York with over 300,000 contestants and was awarded one of three major prizes by the New York Chamber of Commerce.

Memphis, Tenn., unveiled plaque in honour of W. C. Handy, pioneer composer of jazz music. William Edmondson, Negro tombstone cutter was given a one-man show by Modern museum of New York in October, for his "simple, emphatic forms" in Tennessee limestone. Henry O. Tanner, Negro painter, died in Paris May 25; he was the first American Negro artist to attain international fame.

**Religion and Health.**—Three Negro ministers were on teams of the National Preaching Mission that visited four Northern and three Southern cities. Pastors Association, Bridgeport, Conn., elected Negro minister president. Newport News (Va.) white

Methodist ministers resolved to admit Negro ministers to full membership. Methodist Episcopal Church, Methodist Episcopal Church, South, and Methodist Protestant Church voted upon union including Negro conferences in one separate Negro jurisdiction. The 15th annual Race Relations Sunday, February 14, promoted by Federal Council of Churches, was observed by thousands of white and Negro religious groups in churches, colleges, community organizations in all sections of United States; typical features in Portland (Me.), Brooklyn (N.Y.), Durham (N.C.), Chicago (Ill.), Dallas (Texas), Des Moines (Ia.), Portland (Ore.). White and Negro church women held interracial conferences, fostered by Federal Council of Churches, and representing denominations, at Asbury Park, N.J., October 14-15 and at Evanston, Ill., November 29-30. Included among 12 delegates representing the United States at Y.M.C.A. World Council, Mysore, India, were two Negroes—Channing H. Tobias and Benjamin E. Mays.

The Committee on Tuberculosis among Negroes, under auspices of the National Tuberculosis Association, with money from Rosenwald Fund, reported after five years among other work in places where Negro physicians and nurses learn to handle tubercular cases; support was renewed for another five years.

Two outstanding monthly magazines are: *The Crisis*, New York, and *Opportunity, Journal of Negro Life*, New York. (G. E. HA.)

**Nehru, Jawaharlal** (1890— ), Indian Nationalist and Socialist leader, son of Motilal Nehru; educated at Harrow and Cambridge; called to the Bar in London, returning to India shortly afterwards and becoming identified with the Indian Congress party, of which he became leader. After re-election to the presidency of the party on Dec. 6, 1936, Pandit Nehru, at the public session of its Congress on Dec. 27, explained its policy, and expressed his opinion that Socialism was the only remedy for India's ills. The party, he said, was entering the new legislatures not to co-operate with British imperialism, but to combat the Government of India Act and endeavour to end it. After the elections in Jan. and Feb. 1937, he reiterated this policy at a Party Convention on March 19, saying that "this Constitution must go, lock, stock, and barrel." He repeated his condemnation of the Government of India Act on March 27 and April 9, urging steadfastness in the Congress party's policy of refusing to take office in the provinces where it had obtained a majority; but in spite of his pleas the party on July 7 decided to accept office. On July 20, in a statement to the Indian people, Nehru appealed for their co-operation with the Congress, and exhorted them all to wear khadi (*i.e.* homespun cotton cloth) and display the national (*i.e.* Congressional) flag.

**Nejd:** see ARABIA.

**Nepal.** A long, narrow tract of Himalayan country, lying between India and Tibet. Its area is about 54,000 sq.mi., and its population under 6,000,000. The capital is Khatmandu (population about 80,000), where a British resident is stationed. The titular king is Maharaja Bir Bikram Jang; but by ancient usage the *de facto* ruler is the prime minister and commander-in-chief, Sir Joodha Shamsher Jang. The State has complete internal and external independence, but maintains close and friendly association with the Government of India, supplying the Indian army with the recruits for its fine Gurkha regiments.

Early Hindu invasions diluted the original Mongolian stock: Hinduism is practised as well as Buddhism. Cultivation is sparse except in the valleys; and there is much primeval forest, where the wild elephant is still found, among the foot-hills. Rice is freely grown in the part of Nepal which overflows into the plains of India. The Indian railway system runs up to the Nepal border; but Nepal's traditional policy of exclusiveness has prevented it from penetrating farther. (ME.)

**Netherlands,** kingdom of north-west Europe, member of the League of Nations. Bounded N. by the North sea, E. by Germany, S. by Belgium and W. by the North sea. Capital (political), The Hague. Ruler, Queen Wilhelmina (born, 1880; succeeded, 1890; crowned, 1898). National flag, red, white, and blue, in equal horizontal stripes.

**Area and Population.**—The area is 12,692 sq.mi. (exclusive of inland waters, 511), divided into 11 provinces, thus:

Province	Area (sq. mi.)	Population (1935 estimate)	Density (per sq. mi. 1935)
Brabant, North . . . . .	1,921	975,125	507.6
Drente . . . . .	1,029	238,414	231.7
Friesland . . . . .	1,286	415,178	322.8
Groningen . . . . .	886	413,232	466.4
Guelders . . . . .	1,940	891,250	459.4
Holland, North. . . . .	1,137	1,614,424	1,419.9
Holland, South. . . . .	1,130	2,078,704	1,839.6
Limburg . . . . .	846	589,473	696.8
Overysel . . . . .	1,301	553,480	425.4
Utrecht . . . . .	526	452,221	859.7
Zealand . . . . .	690	253,005	366.7

The census population (1930) was 7,935,565 (1935 figures: 8,474,506—4,220,674 males, 4,253,832 females). Amsterdam, the commercial capital (781,645) and Rotterdam (595,448) both exceeded The Hague (482,397); Utrecht, Haarlem, Groningen, and Eindhoven exceeded 100,000 and 12 others 50,000 (1936).

**History.**—Executive power is solely the sovereign's; legislative responsibility rests jointly upon the sovereign and parliament (states-general). A state council of 14, appointed by the sovereign, is, however, consulted on all legislative and many executive matters. The ministry consists of a president and nine other members. The second chamber has 100 deputies, elected for four years by universal adult suffrage (over 25) and proportional representation (1937 election: Catholics, 31; Social-Democrats, 23; Anti-Revolutionists, 17; Christian Historicals, 8; Liberal Democrats, 6; other parties, 15), the first chamber has 50 members, elected by the provinces for six years, half retiring every three years. The 1937 elections disappointed the National Socialists and strengthened the position of Dr. Hendrick Colijn (born,

NETHERLANDS: Industrial production index (*The Annalist*)

1869; prime minister, 1925-26 and since 1933).

On Jan. 7, Princess Juliana, only child of Queen Wilhelmina, was married at The Hague, to Prince Bernhard von Lippe-Biesterfeld. In June the princess announced on the radio her expectation of the birth of a child. The marriage occasioned a revision in the constitution, to provide an income for Prince Bernhard; that of Queen Wilhelmina was reduced.

Germany's guarantee of neutrality being rejected (February), defence steps were reconsidered. The parties to the Oslo convention (1930) assembled at the Hague (March; see also BRUSSELS; NORWAY) and signed a new pact there (May); later, Holland's Oslo concessions were extended to Great Britain and Germany.

**Trade and Communications.**—Over two-thirds of the land was under cultivation in 1935 (a slight increase), pasturage leading (there were nearly  $2\frac{3}{4}$  million cattle and nearly  $1\frac{3}{4}$  million pigs; butter showed an increase, cheese a drop); leading crops are rye and potatoes. Natural resources include coal and salt (one mine). The sea-fisheries are of moderate value.

The centres of population are devoted to trade rather than manufactures, though the output of artificial silk stands seventh in the world. The following figures for exports and imports (1936) include goods in transit for other countries, notably Ger-

many: 772,615,000 guilders (£85,846,000) and 1,016,524,000 guilders (£112,947,000) respectively; these figures showed rises after drops, and those for half 1937 showed further rises. The same is true of Anglo-Dutch trade, with rises of 6% in exports from, and 8.9% in imports to, Great Britain (bacon, condensed milk, bulbs and paper leading).

At Dec. 1935, the mercantile marine had 823 ships (3,285,772 cubic metres). In inland transport the 4,750 miles of rivers and canals play an important part. The use of railways and tramways tends to decline in the face of motor-bus competition. The development of telegraphs, telephones, and radiographs has been normal. Subsidized air services (including the Amsterdam-Batavia line) place Holland fifth in the world in air transport, with (1937) 15,800 miles of route, 110,000 passengers and 1,617 tons of goods.

**Finance and Banking.**—The common unit of currency is the (silver) guilder, or florin (at par, 12.11 guilders=£1).

The 1938 budget showed an income of 689,950,275 guilders (£76,661,000; increase, £6,645,000), about one-quarter derived from direct taxation; and expenditure of 703,195,931 guilders (£78,133,000; decrease, £9,241,000); in view of recent trends the paper deficit was expected to disappear. Direct taxation averages 17 guilders per head over the entire population. Total public debt (Jan. 1937): 2,773,265,000 guilders (redemption, 39,771,000 guilders).

The Netherlands Bank, though private, alone issues bank-notes (two-fifths covered). Position at March 1, 1937:

Assets	Guilders	Liabilities	Guilders
Gold and Silver .	897,271,000	Notes in Circulation . . . . .	814,257,000
Discounts and Advances . . .	199,800,000	Deposits . . . . .	299,994,000
Totals . . . . .	1,097,071,000	Totals . . . . .	1,114,251,000

In 1935 the State postal and other savings banks showed 3,481,714 depositors; average deposit account, 60 guilders.

**Education and Religion.**—Primary education is compulsory. In 1935-36, 7,953 elementary schools (public and private) had 1,232,452 pupils; 430 secondary schools, 71,935, with nearly twice that number in technical schools. In the public universities—Leiden, Groningen, Utrecht and Amsterdam (municipal)—there were 8,630 students; the two voluntary universities had more than 1,000 more. There is complete religious liberty, with State allowances for the churches: Dutch Reformed and other Protestants, closely followed in membership by Roman Catholics, and at longer intervals by Jews and Jansenites.

**Defence Forces.**—In the (home) army there were (1936) 1,568 officers and 15,769 other ranks. The (home) fleet had two coast defence ships and 22 other effective vessels (11 submarines), the East Indies fleet, one coast defence ship, three cruisers, eight destroyers, and 15 submarines; one cruiser is being built. The former maximum annual contingent of 19,500 men (voluntary and conscript) has been nearly doubled, and the period of service raised from  $8\frac{1}{2}$  to 11 months. The State police had, in the cavalry (frontier guards) some 22 officers and 1,180 men, in the field constabulary, 1,340, all ranks. Defence budget (1937); 84,807,998 guilders.

**Neurath, Konstantin von** (COUNT) (1873– ), German statesman, born in Württemberg, trained for the law, but adopted a diplomatic career, and was from 1930 to 1932 ambassador in London. Since 1932 he has been foreign minister of the Reich. Count von Neurath paid a visit to Vienna in the latter part of Feb. 1937 to discuss Austro-German relations and the treatment of Nazis in Austria. At the beginning of May he met Mussolini and Count Ciano in Rome, where discussions took place on the strengthening of the "Rome-Berlin axis"; and during June he visited in turn Belgrade, Sofia, and Budapest, on a mission to endeavour to strengthen the ties binding the States of S.E. Europe with Germany, and meeting the premiers of the three countries and the Tsar of Bulgaria.

**Neutrality.** Neutrality may be broadly defined as the attitude of a State in remaining aloof from a war between two States or groups of States, while observing towards them certain rights and duties based upon customary law and international conventions or treaties. It is, first of all, an attitude of political isolation, in the sense that it makes no effort to distinguish between the opposing groups in respect to the merits of the controversy, but rather regards them as being equally in the right to the extent that international law has imposed no restraint upon their recourse to hostilities. This conception of neutrality, which developed during the 18th and 19th centuries, concentrated upon the immediate concern of the neutral State to avoid being drawn into war at a time when there was no recognized international procedure for passing judgment between the belligerents and each State was free to go to war whenever it believed it to be to its national interests to do so.

The policy of isolation which characterized neutrality down to the close of the World War was, however, never accompanied by a policy of commercial isolation. Neutral States saw no reason why a war between two States should have the effect of cutting off their trade with either or both countries. They recognized certain traditional rights of the belligerent in respect to the maintenance of a blockade and the capture of contraband, but they sought to hold such interference with their commerce down to a minimum. Sharp controversies between belligerents accompanied most wars, and more than once, as in the case of the United States in 1812 and in 1917, the neutral was led to declare war upon one of the belligerents in defence of its alleged rights of trade with the other.

In addition to the issues created by the interference of belligerents with neutral rights of trade, numerous controversies arose bearing on the one hand upon the violation of neutral sovereignty by the commission of acts of hostility by a belligerent upon neutral territory or in neutral territorial waters, and on the other hand upon the extent of the obligation of a neutral to prevent the use of its territory as a starting point for expeditions in favour of one belligerent against another. Municipal laws passed by a neutral State to give effect to its obligations towards the belligerents are known as "neutrality laws," as distinct from the general international law of neutrality. Such were the neutrality laws passed by the United States Congress in 1794 and 1818 and the British Foreign Enlistment Act of 1870.

The paradoxes attending the desire of neutral States to avoid being drawn into war and their determination not to permit interference with their trade beyond the accepted rules reached their height during the World War. Belligerents claimed that the old rules were obsolete when they failed to take account of the changes in the conditions of warfare which worked to their advantage, and then inconsistently stood for the existing law when

the changed conditions worked against them. Thus the customary rule with respect to the capture of belligerent merchant vessels broke down when the submarine made its appearance as a destroyer of commerce. Again, the rule that there was no obligation on the part of the neutral State to prevent its citizens from shipping arms broke down when the United States became a vast arsenal of supply for the Allied Powers.

**League of Nations.**—At the close of the World War an effort was made to put an end to the status of neutrality by making all nations collectively responsible to protect one another, so that in the future, if war broke out, instead of being neutral they would determine which of two parties to a conflict was the aggressor and take sides against it. The United States, however, refused to become a party to the collective security system of the League of Nations, with the result that neutrality continued to be a possible legal status; and it remained uncertain to what extent the United States would insist upon the traditional rights of neutral trade in the event of collective action by the members of the League against an aggressor.

**Kellogg-Briand Pact.**—The uncertainty continued even after the adoption of the Kellogg-Briand Pact which renounced war as an instrument of national policy and agreed that the settlement of all disputes should never be sought except by pacific means. Did this mean that, if the Pact were violated at the same time that the Covenant of the League of Nations was violated, the United States would accept such modifications of its neutral rights of trade as were necessary to avoid interference with sanctions imposed by the League against an aggressor? The answer was not clear. The Pact contained no machinery to determine the question of its violation; and there were loopholes in its obligations which prevented an automatic determination of the issue.

The imposition by the League of Nations of sanctions against Italy in 1935 raised the issue of neutrality in concrete form. In anticipation of Italian hostilities against Ethiopia, the U.S. Congress passed a law, Aug. 31, 1935, which although designated a "neutrality act" actually went beyond the traditional obligations of a neutral by prohibiting the shipment of arms and ammunition and the making of loans to belligerents. Inasmuch, however, as the law treated both belligerents alike, irrespective of the determination by the League that Italy was the aggressor, it still continued the policy of isolation.

A new law was passed by Congress on April 30, 1937, which extended the provisions of the law of 1935 by authorizing the President, if in his judgment the emergency called for it, to forbid the export of "certain articles or materials" when necessary to promote the security or preserve the peace of the United States. These "other articles" appeared to include goods that would normally be contraband, such as scrap iron, oil, cotton and other raw materials of war industries. No American ship might carry them to a belligerent, but they could be obtained by the belligerent on what was popularly called the "cash and carry" plan. This law concentrated upon keeping United States citizens out of the area of conflict. It was recognized by its proponents as not being a strict "neutrality" law, and it was criticized by opponents as having the effect of favouring the belligerent which happened to have command of the seas and could come and buy what it needed. The test of the new law came when hostilities were begun by Japan against China in July 1937. The President, not wishing that Japan, after violating the Nine-Power Treaty, should get the practical benefits of the "cash and carry" plan, took the position that since neither Japan nor China had formally declared war there was no compulsion upon him under the law to "find that there exists a state of war." The neutrality law was therefore not brought into effect (Jan. 1, 1938).

What is to be the future of neutrality? The answer depends in

large part upon the possibility of the development of an effective system of collective security in which all of the leading nations shall take part. If such a system can be established, then each nation may be expected to find a strong national interest in the maintenance of international law and order, and neutrality in the presence of violations of the law would be as inconsistent between nations as between citizens under national law. Failing the establishment of a system of collective security, it would seem probable that in the event of war States not parties to it will be presented with the choice of asserting their traditional rights of trade at the risk of controversies with the belligerents or of pursuing a policy of greater or less commercial isolation in the hope that by the sacrifice of their trade they may avoid being drawn into the conflict. (See also CONGRESSIONAL LEGISLATION; UNITED STATES: *Congress*.) (C. G. FE.)

**Nevada**, popularly known as the "Sagebrush" and also as the "Silver" State, has an area of 110,690 sq.mi. and a population of 91,058 (U.S. census, 1930); 101,000 (estimated, July 1, 1937). The State capital is Carson City, with a population of 1,596 and the largest city is Reno, population 18,529. Of the State's population 37.8% are urban; 89.4% white, 6.6% Indian, 3.4% Mexican or oriental, and .06% coloured. About 83.4% of the population is native born and 16.6% is foreign born.

**History.**—Nevada has been unusually prosperous in recent years except for a brief period during 1932 and 1933, the years of a nation-wide depression. Large factors in maintaining prosperous conditions in the State have been the construction of the Boulder dam and appurtenant structures in southern Nevada, at a cost of about \$100,000,000, and other large impounding dams for the conservation of water, built on the Truckee and Humboldt rivers in Northern Nevada. A new power line costing approximately \$1,000,000 now conveys cheap power from the Boulder dam to the well mineralized areas in the south-eastern part of the State, and improved scientific methods of prospecting are causing development of further commercial ore bodies in the older mining districts like Comstock and Eureka.

The present principal State officials are as follows: governor, Richard Kirman; lieutenant-governor, Fred Alward; secretary of State, Malcolm McEachin; attorney-general, Gray Mashburn; State treasurer, Dan Franks; State controller, Henry Schmidt; surveyor general, Ray Staley; mine inspector, Matt Murphy; U.S. Senators, Key Pittman and Pat McCarran; U.S. Representative, J. G. Scrugham.

**Education.**—The per capita expenditure for each child of school age in Nevada (1936) was: elementary \$130.63; high school \$164.20. The only institution of collegiate rank is the University of Nevada in Reno which has an enrolment of 1,010 students. Its library contains about 55,000 volumes. The Mackay School of Mines is particularly well equipped and endowed, while the other branches of the University are likewise supported by the State. There are in Nevada 278 elementary schools with an enrolment of 14,748 and 40 high schools with 4,972. During 1936 the State employed 651 elementary school teachers and 265 high school teachers at an expenditure of approximately \$503,000.

RICHARD KIRMAN, governor of Nevada

## NEVADA—NEW BRUNSWICK

**Charities and Correction.**—A State orphans' home is located at Carson City, a State hospital for mental diseases at Reno, and a home for male juvenile delinquents at Elko. The State penitentiary is located at Carson City.

**Banking and Finance.**—The finances of the State of Nevada are in unusually sound condition. There is a Treasury surplus of more than \$3,000,000, and no bonded debt except that held within the State. The State has no income tax, inheritance tax, gift tax or sales tax. The principal banking institution of Nevada is the First National in Reno which has 11 branches throughout the State, having deposits in excess of \$28,500,000.

**Agriculture, Mineral Production.**—According to the latest census there are 3,696 farms in Nevada having a farm population of 15,385 persons. The State has a total farm acreage of 3,621,769 ac. mostly held in units exceeding 1,000 acres. The principal crop is hay used for live stock feed. The number of cattle ranged is 342,213 and the number of sheep ranged is 834,091. The ranges on the public domain are now largely under the control of the U.S. Forest Service and the U.S. Grazing Service, and efforts are being made to prevent overgrazing through reduction of the number of animals allowed on the range. The mineral production of Nevada in 1937 was valued at \$34,540,326. It included: gold, 276,100 oz., \$9,663,500; silver, 4,536,000 oz., \$3,520,000; copper, 155,770,000 oz., \$14,150,000; lead, 17,500,000 oz., \$810,000; and zinc, 24,370,000 oz., \$1,220,000.

Nevada has a recorded production of 23,354,644 oz. of gold, valued at \$495,533,522, that was produced from 1859 to 1937 inclusive. This constitutes about a tenth of United States gold production since 1792. Of silver 556,118,000 oz. were produced during the same period. This amounts to about a sixth of the total United States silver production.

Copper production in the State became important much later, but a total of 1,184,991 tons of copper is credited to Nevada so that it ranks fifth among the States in copper production, though its current rate is exceeded by only three other States.

Nevada has likewise been an important producer of both lead and zinc; and in recent years it has become the chief State in production of tungsten. Scheelite ores are mined in three localities, near Mill City, Mina and Lovelock. In 1936 production amounted to 1,631 tons of 60% WO<sub>3</sub> concentrates.

(JA. G. SC.)

**Newbery Medal:** see CHILDREN'S BOOKS; LITERARY PRIZES: *United States*.

**New Brunswick**, one of the original Provinces which united to form the Dominion of Canada in 1867; area 27,985 sq.mi.; population, according to the Dominion census of 1931, 408,219, estimated Jan. 1, 1938, 435,000. Capital, Fredericton, 8,830. The only other cities are Saint John, 47,514, the most important port, and Moncton, 20,689, the main divisional point of the Canadian National Railway in the Maritime Provinces. Of the Province's population 263,432 are rural, or 64%; 403,049 are Canadian born or nearly 99%. The present Government assumed office in 1935 as the result of a Liberal victory over the Conservatives.

The New Brunswick Electric Power Commission, recently established, now owns and operates two generating stations, one near the city of Saint John and the second at Grand Lake in the Minto coal area. The former sells power to the cities of Saint John, Moncton and Fredericton and the latter to Newcastle and Chatham. Power is also distributed directly by the Commission to a large number of villages and rural communities. The value of the net production for the Province in 1934 was \$58,732,376 (£11,746,000), an increase of nearly 25% over the preceding year.

The maximum of the fourteen-year period ending in 1934 was reached in 1928. The high level of that year was followed by four years of decline. The estimated wealth of the Province is \$885,11,000 (£177,102,000); wealth per capita \$2,118 (£420). The net value of manufactured products in 1935 was \$27,643,366 (£5,528,000), a slight increase over the preceding year. The gross value of agricultural products in 1935 was \$25,278,000 (£5,055,000). New Brunswick is not an important mineral-producing Province, the value of the output in 1936 being only \$2,499,380 (£499,000).

New Brunswick is represented in the Dominion Parliament by 6 Senators, appointed for life, and 10 members of the House of Commons, who are elected for five years or less.

**New Caledonia:** see PACIFIC ISLANDS, FRENCH.

**New Deal:** see CONGRESSIONAL LEGISLATION; ELECTIONS; RELIEF; ROOSEVELT, FRANKLIN DELANO; SOCIAL SECURITY; SUPREME COURT OF THE UNITED STATES; TRADE AGREEMENTS; UNITED STATES.

**Newfoundland,** island off the east coast of Canada, the earliest overseas British possession; in theory a self-governing dominion, but ruled since the financial crisis of 1933 by a governor assisted by a governing commission consisting of three representatives of Newfoundland and three of the United Kingdom, responsible to the British Dominions Office. Labrador (1947, v.) is a dependency of Newfoundland. Area, 42,740 sq.mi.; population (census 1935), 289,500. St. John's, the capital (pop. 1935, 39,886), is the only town of over 10,000 inhabitants. The Anglican and Roman Catholic Churches are roughly equal in membership (about 95,000 each), closely followed by the United Church. The schools, mainly under Government control, though denominational, number about 1,100, with some 56,000 pupils.

In March 1937, a petition to the King was prepared calling attention to the continuance of conditions of poverty and the increased expenditure under the Commission of Government, and asking for the restoration of normal governmental conditions and the recall of the British Commissioners.

The principal industry is fishing, which employed 35,390 persons in 1937. There are over 800 mi. of railway, and steamers connect the coast with Cape Breton island. The estimated revenue for 1937-38 was £2,022,835 and the expenditure £2,718,669. Exports—mainly newsprint, fishery products, and iron ore—were valued in 1936-37 at £5,611,615 and imports at £4,784,977. The dollar, of equivalent value to the American dollar, is the coinage standard.

**New Guinea** consists of the British (Australian Commonwealth) territory of Papua, Netherlands New Guinea, and the mandated territory, which includes the Bismarck archipelago and other islands.

**Papua** comprises the south-eastern part of the island of New Guinea, with a number of groups of islands. Capital, Port Moresby. Area: mainland, 87,786 sq.mi.; islands, 2,754 square miles. Population (1937), 1,306 Europeans and about 275,000 Papuans. The territory is administered by the Australian Commonwealth Government through a lieutenant-governor, Sir Hubert Murray, K.C.M.G. Revenue (1936-37), £171,791; expenditure, £71,959. Exports (1936-37), £524,001; imports £452,056.

**Netherlands New Guinea** consists of the portion of the mainland W. of long. 141° E. with adjacent islands. It is governed with the Molucca islands under the governor-general of the Netherlands East Indies, Jonkheer Dr. A. W. L. Tjarda vanarkenborgh Stachouwer.

**The Mandated Territory of New Guinea** lying between the equator and 8° S. lat., and between 141° E. and 156° E. long., comprises the former German dependencies of Kaiser Wilhelm's Land (New Guinea), the Bismarck archipelago, and the eastern group of the Solomon islands. The mandate is held by Australia, and is administered under an administrator, Brig.-Gen. W. R. McNicoll. Area: mainland, 70,000 sq.mi.; Bismarck archipelago, 19,200 sq.mi.; Bougainville and Buka (Solomon islands), 4,100 square miles. Population (1936): 5,881 Europeans (including 3,352 British, 477 Germans), 1,571 Asiatics, and 500,040 natives. Capital, Rabaul (New Britain). Rabaul was seriously damaged by volcanic eruption in June 1937, and proposals were made for shifting the capital. Revenue (1935-36), £419,919; expenditure, £425,793. Exports (1935-36), £2,573,251; imports, £1,290,788.

(H. V. H.)

**New Hampshire,** one of the original States of the United States, popularly known as the "Granite State"; area, 9,282 sq.mi.; population (U.S. census 1930) 465,293, estimated July 1, 1937, 510,000. Capital, Concord, 25,228. Other cities with populations exceeding 20,000: Manchester, 76,834; Nashua, 31,463; Berlin, 20,018. Of the State's population 273,079, or 58.7% were (1930) urban; 464,350 whites. Of the white population, 381,690 were native born, and 82,660, foreign born. Important foreign-born elements were: United Kingdom and Ireland, 11,539; French Canadians, 37,682; other Canadians, 13,277.

**History.**—Governor, Francis P. Murphy (Republican); secretary of State, Enoch D. Fuller; State treasurer, F. Gordon Kimball. During 1937, Alphonse Roy (Democrat) unsuccessfully contested the seat of U.S. Representative Arthur B. Jenks, following their election tie of 1936. In the presidential election of Nov. 3, 1936, Roosevelt and Garner received 108,460 votes, Landon and Knox 104,642. Important measures passed by the legislature in its 1937 session of record-breaking length were: a 48-Hour Act for women and minors in labour; acts establishing a State Milk Control Board; a State Police, and a State Department of Public Welfare to administer poor relief and old-age assistance and to supervise State welfare institutions; provision for a constitutional convention in 1938 to consider an amendment to authorize a State "RFC" to lend money to needy industries.

**Education.**—New Hampshire's educational system included 103 approved public high schools; 18 public academies approved as high schools; 4 accredited private academies; and 2 normal

schools located at Plymouth and Keene. There are also four institutions of higher education: University of New Hampshire, Durham; Dartmouth college, Hanover; St. Anselm's college, Manchester; and Colby Junior College for Women, New London. There were in 1935 some 357 juvenile camps licensed by the State Board of Health.

FRANCIS PARNELL MURPHY, governor of New Hampshire

At Concord is located the New Hampshire Historical Society, Otis G. Hammond, director. Total State expenditures for public education, year ending June 30, 1936, \$7,549,552.

**Charities and Correction.**—The principal charitable and correctional institutions are the New Hampshire State Hospital

for the Insane, Concord; Laconia State school, for feeble-minded children, Laconia; New Hampshire State Sanatorium, for tubercular patients, Glencliffe; New Hampshire Industrial school, for committed minors, Manchester; State Prison, Concord; and Soldiers' Home, Tilton.

**Banking and Finance.**—Savings banks and savings departments of trust companies reported deposits of \$201,592,085 as of June 30, 1937, being an increase over June 30, 1936, of \$3,790,867. There were also 28 building and loan associations with assets of \$11,157,511, June 30, 1937, an increase of \$251,050 over preceding year. Cash receipts of State Treasury Department, for fiscal year ending June 30, 1936, \$30,745,450; cash disbursements, \$29,531,508. Net bonded indebtedness June 30, 1936, \$12,227,045. Average tax rate in 1936, \$34.30 on each \$1,000 of valuation, or double the average rate in 1916.

**Agriculture, Manufactures, Mineral Production.**—Major farm products are milk and cream, potatoes, apples, dairy cattle, and live poultry, marketed principally in cities of Eastern and Central Massachusetts and New York city. Estimated acreage in 1934, used for crops, 448,000; for pasture, 961,000; woodland, 1,274,000. Lumber production, 1934, estimated at 155 million board feet. Number of farms, 1935, 17,695, with average value of \$3,783. Principal industries produce textiles, boots and shoes, and lumber and wood products, including paper. Value of manufactures, in 1935, \$209,384,111. Electric power generated in 1935, in kilowatt hours: water power, 681,000,000; fuel power, 50,000,000. Estimated income from recreational facilities afforded by State, around 1930, \$76,256,500. Mineral products are of minor importance, but include granite, mica, sand, and gravel.

(W. E. Ss.)

**New Hebrides,** an archipelago in the south Pacific between latitudes 13° S. and 21° S. and longitudes 166° E. and 170° E., administered under a British-French condominium. British high commissioner, Sir Arthur Richards, K.C.M.G. (governor of Fiji and high commissioner for western Pacific); French high commissioner, M. Marchessou (governor of New Caledonia). Resident commissioners: British, G. A. Joy; French, M. Sautot. There are English and French courts, and a mixed court presided over by a judge, who is a national of neither country (Señor Manuel Bosch Barrett). Area, approximately 5,700 square miles. Population (1937): 197 British nationals, 750 French nationals, 1,042 French-protected subjects, and about 40,000 natives. Budget (1936): joint revenue, £22,220; joint expenditure, £21,866. Expenditure on the British service in 1935 was £8,911. Trade (1936): exports, £122,068; imports, £123,800.

(H. V. H.)

**New Jersey,** described as the "Garden State," was one of the original States of the United States; area 8,224.44 sq.mi.; population according to U.S. census of 1930, 4,041,000, estimated by U.S. Census Bureau, July 1, 1937, 4,343,000; capital, Trenton, 120,000. The largest city is Newark, population 1930, 442,337. Of the State's population in 1930, 1,571,548 are native whites and of native parentage; 208,828 coloured; 1,413,239 native white and of foreign or mixed parentage; 844,442, foreign born. The urban population was 3,339,244, or 82.6%.

**History.**—The year 1937 saw the election for the third time as governor of A. Harry Moore, Democrat of Jersey City, the first third-term governor in the history of the State. He defeated Senator Lester H. Clee, Republican of Essex county, by 45,000 votes. The Republicans, however, won control of both houses of the legislature for the 1938 session and will have a majority on joint ballot by 27 votes. President Roosevelt, in 1936, again carried New Jersey, this time by 364,128, the largest majority

ever accorded a candidate in a general election in the State's history. Governor Hoffman during his administration endeavoured unsuccessfully to have the legislature enact a combination sales and income tax calculated to raise \$40,000,000 annually. Primarily both taxes were designed to provide funds for unemployment relief which, in 1937, was less acute than during the nadir

A. HARRY MOORE, governor of New Jersey

of the depression. The State appropriated \$12,000,000 as aid for municipalities in meeting the relief problem, but the sum was insufficient. The legislature was reconvened in November to appropriate additional funds but failed to do so. The burden of meeting the deficit was shifted to Governor Hoffman who raised from general sources the necessary \$3,000,000. The 1936 session of the legislature was notable for the fact that less than 200 laws were adopted, the lowest number since 1888. Legislation approved included the revision of New Jersey statutes, representing a 12-year task. Bills designed to stop the flow of bootleg coal from the Pennsylvania fields were adopted, as were also appropriations aggregating \$88,506,912. Salary reductions imposed upon State employees as a depression measure were rescinded, and graduated increases were granted. The year 1937 witnessed the completion of the south tube of the Lincoln tunnel connecting Weehawken with mid-town New York. Work of constructing the north tube continued, with the expectation that it would be completed by 1941. The total cost will be \$85,000,000.

**Education.**—New Jersey's excellent system of public schools had its inception in 1816. In 1936 the total expenditures for all public school purposes was \$114,194,271. That total included State and county administration, pension funds, libraries, training and special schools, debt service and incidental educational costs. The average daily attendance in public schools in 1933-34 was 700,195 and the enrolment in private and parochial schools aggregated 135,276.

**Finance.**—A total of \$530,277,386.45 was collected in local State and Federal taxes in New Jersey for the fiscal year ending June 30, 1937. The assessed value of real and personal property in 1936 was \$5,570,748,443 of which \$4,927,442,133 was represented by real estate and \$643,306,310 by personal property. The State's bonded debt at the close of the 1936 fiscal year was \$189,776,000.

**Agriculture and Manufacturing.**—As urban employment opportunities declined during the depression years from 1930 to 1935, there was a substantial "back to the land" movement in New Jersey. Where the number of farms in 1930 had declined to 25,378 from 29,671 in 1925, the farms under cultivation had increased by 1935 to 29,375, an increase of 3,997. The value of farm lands and buildings in 1930 was \$298,845,113. Official estimates in 1935 placed the value of this property at \$234,313,485, although the average value of farm land per acre in the latter year was only \$122.41 as against \$169.99 in 1930. Total farm acreage in 1935 stood at 1,914,110 compared to 1,758,027 in 1930. Farm cattle increased from 152,187 in 1930 to 177,879 in 1935. The dairy industry produced 798,000,000 lbs. of milk in 1935. There were in the State 139,000 cows and heifers valued at \$106 per head, the highest in the United States. The total value of 64 principal crops in 1936 was, according to the U.S. Department of Agriculture, \$34,448,000.

New Jersey ranked sixth of the United States in the value of output during 1935 with 7,468 establishments employing 17,078 wage-earners and producing products worth \$2,439,426. In order of importance, the leading industries and their value of output were: petroleum refining (\$157,862,663), copper refining (\$143,525,982), chemicals (\$138,128,726), electrical machinery (\$91,709,000), meat-packing (\$76,015,870), and paints and varnishes (\$65,503,612). (A. J. S.)

**New Mexico**, the fourth largest State in the South-western United States, popularly known as the "Sun-belt State"; area, 122,634 sq.mi.; population according to the U. S. census of 1930, 423,317 (official estimate July 1, 1937, 422,000). Capital Santa Fé, 11,176. Albuquerque is the only larger city, 26,570. Of the State's population 106,816 are urban, or 25.2%; 331,755 white; 59,340 Mexican; 28,941 Indian.

**History.**—The Administration, legislature, and congressional representation of New Mexico is Democratic. The chief officers of the State elected for two years are: governor, Clyde Tingley; lieutenant-governor, Hiram M. Dow; secretary of State, Mrs. Elizabeth F. Gonzales; auditor, Jose O. Garcia; treasurer, James M. Connelly; attorney-general, Frank H. Patton; superintendent of public instruction, H. R. Rodgers; commissioner of public lands, Frank Worden. The national representatives are Senator Carl A. Hatch, Senator Dennis Chavez, and Representative John W. Dempsey.

Recent laws of interest provide for local option in the sale of liquor, a State examination and licence for automobile drivers, a legislative reference bureau, property appraisal every four years, a State police force and ports of entry to enforce motor vehicle laws, and a social security act. The child labour amendment has been ratified and a State constitutional amendment adopted limiting property taxation to twenty mills on the dollar.

**Education.**—For the school year 1936-37 public schools cost \$2,218,282 for 162,436 children. The State also supports the University of New Mexico, College of Agriculture and Mechanical Arts, Normal university, School of Mines, Normal school, Eastern New Mexico Junior college, Spanish American Normal School, and the Military Institute.

**Charities and Correction.**—State charitable institutions are: School for the Deaf, School for the Blind, Home and Training School for Mental defectives, Industrial school, Girls' Welfare School, Insane Asylum, Miners Hospital, penitentiary, and the Carrie Tingley Crippled Children's Hospital.

## Banking and Finance.

On June 30, 1936, there were 41 banks with total resources of \$52,000,000. The assessed value of New Mexico for 1936 was \$310,791,170. Total State revenue receipts for the fiscal year ending June 30 were \$22,396,000. A 5¢ gasoline tax yielded \$4,057,000; a 2% sales tax, \$1,069,591.72; and a 2 mills general property tax, \$1,928,353.71.

Estimated \$70,000,000 was spent by tourists.

**Agriculture and Mineral Production.**—The leading farm products were: cotton, \$4,600,000; wheat, \$2,050,000; beans, \$275,000; cottonseed, \$1,150,000. Live stock raising is a major activity, there being 1,039,000 head of cattle and 2,477,000 head

of sheep valued at \$52,342,000 in 1936. In the same year minerals of the following values were produced: petroleum, \$22,033,000; coal, \$4,300,000; natural gas, \$4,292,000; zinc, \$2,066,800; gold, \$1,156,245; natural gasoline, \$1,125,000. (F. D. R.)

**New South Wales.** A State of the Australian Commonwealth, lying in the south-east, and occupying 309,432 square miles. The State governor, representing H. M. King George VI, is Lord Wakehurst. Population (Dec. 31, 1936), 2,682,000, forming 39.3% of the population of Australia. Capital, Sydney. The premier of a Nationalist government is Mr. B. S. Stevens.

**History.**—Legislation in 1937 included a Public Health Amendment Act, designed to check the spread of infantile paralysis, particularly by preventing the admission of children from the State of Victoria; an Act providing for financial assistance to a company to work the shale oil deposits at Newnes; an Act to prolong a moratorium on mortgage debts for two years from Feb. 1938; an Industrial Arbitration Act applying the Commonwealth basic wage to State industrial awards; a Local Government Act providing for loans to county councils; and an Act imposing a uniform speed-limit of 30mph. in built-up areas. A notable development in State politics was a movement of revolt in the Labour party against the leadership of Mr. J. T. Lang after the Federal elections, in which Labour was disappointed.

Preparations were made for celebrating in 1938 the 150th anniversary of the founding of Australia.

**Trade, Industry, and Finance.**—The output of primary and secondary industries in 1935-36 was valued (gross) as follows: wool, £27,321,000; agriculture, £16,796,000; other pastoral, dairying, and farmyard industries, £20,432,000; silver lead ore, concentrates, etc., £3,816,000; coal, £5,127,000; other minerals, £2,577,000; forests, fisheries, trapping, £4,165,000; total, primary industry, £76,759,000; manufacturing industry (net), £69,470,000. In June 1937, of 856,000 workers available for employment, only 56,000 were not normally employed (excluding relief workers). In November a record low level of 4.3% of registered unemployment was established, the figure in the previous November having been 9.9%.

The budget for 1936-37 closed with a surplus of £74,310. For 1937-38, expenditure was expected to increase from £49,884,775 to £53,642,522, and receipts from £49,959,085 to £53,651,920, giving an estimated surplus of £9,398. These figures include the gross returns of railways and other business undertakings, which provided £24,488,095 of gross revenue and £7,839,428 of net revenue (excluding interest) in 1936-37. Net revenue from them in 1937-38 was estimated at £8,143,702.

Of the increased budget expenditure in 1937-38, basic wage increases accounted for £1,507,000, and the full restoration of public service salaries for £645,000. The special wages and income taxes, imposed in 1931-32 for the relief of unemployment, were lightened by graduated reductions of tax on incomes under £1,000, by further reducing rates of tax on heads of families, and by exempting pension income where the total income did not exceed £200. These concessions were estimated to cost £1,700,000 in 1937-38 and £2,700,000 in a full year.

Loan expenditure (not included in the budget) would fall from £8,028,968 gross to £7,225,000 gross in 1937-38, and from £7,182,523 net to £5,225,000 net. The net increase in the public debt in 1936-37 was £3,715,205. (H. V. H.)

**Newspapers.** In the offices of the 2,000 daily and 11,000 weekly newspapers of the United States, the year 1937 was chiefly marked by new financial problems, which were the theme of all publishers' meetings and which reached a

CLYDE TINGLEY, governor of New Mexico

SIX U. S. NEWSPAPER COLUMNISTS noted for their comment on politics and economics. Left to right: Mark Sullivan, David Lawrence, Frank R. Kent, Dorothy Thompson (Mrs. Sinclair Lewis), Walter Lippmann, General Hugh S. Johnson

perplexing climax as the year closed. In spite of material gains in circulation and of an increase in advertising income during the first half of the year (which later declined during the "recession"), newspapers faced an unprecedented rise in costs of print paper, wages, taxes and security levies, machinery and supplies. To meet these rising costs, nation-wide campaigns to raise circulation and advertising rates were launched, and December saw the 2-cent newspaper disappearing from the news-stands, replaced by 3-cent and even 5-cent newspapers.

Early in the year a sharp rise in the price of Canadian news print, chief paper supply of American newspapers, was announced, and by fall the increase had amounted to about 17%, with the two leading Canadian paper companies setting the 1938 price at \$48 and \$50 a ton. As a result, two movements were launched (one a co-operation of Texas publishers and the other a \$5,000,000 project) to start manufacture of news print from southern timber—putting into production the results of laboratory experiments of some years before.

While the typographical and other mechanical unions increased their strength and obtained wide-spread wage increases, the growth of unionization of editorial workers through the American Newspaper Guild raised editorial salaries, both in Guild offices and in other newspapers. In June, the Guild, which had in 1936 obtained an American Federation of Labor charter, voted to join the Committee on Industrial Organization, broadening its base to include all unorganized newspaper workers, as well as editorial staff members, and to fight for "the Guild closed shop." Later in the same month, 565 newspaper publishers and executives, representing eleven organizations, met in Chicago and voted to oppose the editorial closed shop as a menace to freedom of the press.

By the close of the year, the Guild had added 27 more contracts, mainly open-shop, to the 23 previously signed, and announced that its membership had increased from about 5,500 to about 11,000. The Guild conducted nine strikes (Long Island, N.Y., *Press*; Bellingham, Wash., *News*; Flushing, N.Y., *North Shore Journal*; Seattle, Wash., *Star*; Decatur, Ill., *Herald and Review*; Brooklyn *Eagle*; Bayonne, N.J., *Times*; Waterbury, Conn., *Democrat*; and Wilkes-Barre, Pa., *Record*). The leading labour case won by the Guild during 1937 was that of Morris Watson, Associated Press employee whose reinstatement was ordered, not

only by the National Labor Relations Board, but also by the U.S. Supreme Court. Meanwhile, the American Press Society, an unaffiliated professional editorial staff organization, started in New York in 1936, gained size with its membership limited to daily newspaper editorial workers of more than four years' experience.

The outstanding news events of the year, on the basis of newspaper space devoted to them, were listed by the three great press associations as follows: (1) Roosevelt loses the supreme court battle; Senator Robinson dies; Senator Black appointed to bench amid Ku Klux Klan controversy; (2) Labour splits and then moves to make up; C.I.O. wages the largest steel strikes in history after employing the sit-down strike to tie up automobile factories; (3) War invades two continents; Japanese-Chinese undeclared war develops into the greatest conflict since the World War; Fascist nations form anti-Communist united front and the arms of five major powers are employed about Spain; (4) The Zeppelin "Hindenburg" burns in the air in front of news cameras killing 36 of 97 passengers and crew; (5) Nature was good to U.S. farmers, but the stock market broke and business receded, disturbing Washington; (6) Duke of Windsor, former king of England, marries an American woman; (7) 427 persons die in explosion of schoolhouse in New London, Texas; (8) Amelia Earhart lost in Pacific on a round-the-world flight; (9) England crowns a king; (10) The Ohio river floods several cities; (11) The blood purge continues in Soviet Russia; (12) Exploratory flights foreshadow new air service linking America and Europe.

Among the changes in ownership of larger newspapers, two trends were noteworthy: (1) The Milwaukee *Journal*, following the lead of the New York *Sun*, the Chicago *Daily News*, and Kansas City *Star*, completed reorganization on a plan of employee ownership. (2) Consolidation among the newspapers owned by William Randolph Hearst marked his 50th year as a publisher and followed the death of Arthur Brisbane on Dec. 25, 1936.

In June, Mr. Hearst merged the New York *American* with the *Mirror*, suspended the Rochester, N.Y., *Journal*, and shifted the Albany, N.Y., *Evening Times* into the morning to reduce competition. In Washington, D.C., he leased both the *Herald* and the *Times* to Eleanor Patterson. On August 14, he merged the International News Service and Universal Service. On Sept. 1, he withdrew a petition for the sale of debenture issues of \$35,500,000. In September he regained the Milwaukee *Sentinel*, consolidated it with the Wisconsin *News*, and sold his interest in the Pittsburgh *Post-Gazette* to Paul Block. A month later he sold

the Omaha *Bee-News*. During the year he reduced his chain from 18 newspapers in 18 cities to 20 newspapers in 14 cities.

Among the noted newspaper men who died during 1937 were: John Ogden, 81, editor of the New York *Times* for 17 years and previously editor of the New York *Evening Post* for 29 years; Fred Fuller Shedd, 66, for many years editor of the Philadelphia *Evening Bulletin* and leader in the American Society of Newspaper Editors; F. E. Ives, 81, Syracuse, N.Y., inventor of half-tone engraving; Frederick Burr Oppen, 80, creator of "Happy Poligan"; Ed Howe, 84, Kansas "Sage of Potato Hill"; Edward Harris, 57, publisher of Richmond, Ind., *Palladium & Item*, and secretary of American Newspaper Publishers Association; and Robert W. Bingham, 66, owner of Louisville, Ky., *Courier-Journal*, and since 1933 ambassador to Great Britain.

Warfare between radio and newspapers subsided with the settlement out of court of the \$1,700,000 suit of Transradio against newspaper competitors. Another blow was dealt to "shopping newspapers" by continued refusal of the Audit Bureau of Circulation to recognize free circulation publications. Growing public action against liquor advertising was evidenced by the refusal of 552 daily newspapers, one-fourth of the total, to carry advertisements of "hard liquor," and among them 178 also barred beer advertising.

Statistics on American newspapers for the year, as given in the standard directories of Jan. 1938, are as follows: The number of English-language dailies decreased 23 to a total of 2,084, including 1,605 evening papers and 479 morning newspapers; but their combined circulation increased to 41,400,000 daily, the highest record, including 25,800,000 in the evening and 15,600,000 in the morning. Sunday newspapers increased 15 to a total of 535 with a combined circulation of 31,000,000. Rural and suburban weekly newspapers decreased 176 to a total of 10,629; semi-weeklies decreased 18 to 359. Foreign language dailies increased to a total of 135 in 24 languages, and foreign language weeklies increased three to 294. A total of 214 daily and weekly negro newspapers were listed. The number of radio stations operated by newspapers increased to 183. (See also ADVERTISING.)

(G. M. Hy.)

**Great Britain and Europe.**—Economic pressure and political activities rather than journalistic developments made 1937 one of the most important years in newspaper history, causing production costs to soar, and forcing many papers on the Continent to increase their selling price, while in Italy the situation was met by Government-decreed reduction of contents.

Political developments led to censorship or suppression in most European countries and had their international reactions. Thus, Mussolini, annoyed by the attitude of most British newspapers to Italian activities in Abyssinia and Spain, practically boycotted the coronation of King George VI in May, withdrawing all Italian correspondents from London; such Italian reports as appeared were only upon minor disturbances, magnifying them into large scale outbreaks. Mussolini also banned the importation of all British newspapers except the *Daily Mail*, *Evening News*, *Sunday Pictorial* (i.e. the "Rothermere" journals), and *Observer*, which followed a pro-Italian policy; this boycott was quietly raised in the year. During May the *News Chronicle* correspondent was expelled from Rome.

In August the British Home Office refused to renew the permits-to-stay of three London correspondents of the Berlin press, and Hitler retorted by expelling Mr. Norman Ebbutt, Berlin correspondent of *The Times*, one reason given being the publication in 1933 of a series of articles in *The Times* on the first year of Nazism, which had been republished by the Friends of European Unity.

Many other journalists in various countries were either expelled

or refused renewal of permits; the Yugoslavian authorities refused in July to renew the permit of Mr. Robert Harrison, Reuter's Belgrade correspondent, and in November, M. Paul Ravoux, chief correspondent of the French news agency "Havas," was expelled from Berlin.

In England, the disappearance of the London *Morning Post* as a separate publication, after 165 years of independent life, was an outstanding event. Lord Camrose, who purchased it, merged it with his *Daily Telegraph* on Oct. 1.

Among other important events during the year was the separation, in January, after 35 years of partnership, of the Berry Brothers' (Lords Camrose and Kemsley) newspaper interests; companies with an aggregate capital of £16 millions and owning 21 newspapers in London and in seven provincial and five other centres, in addition to more than 100 periodicals, were affected. Lord Camrose left the boards of Allied Newspapers, Ltd. and its associated companies, retaining control only of the *Daily Telegraph* and *Financial Times*; Lord Kemsley acquired sole control of the *Daily Sketch*, *Sunday Graphic*, *Sunday Times*, *Sunday Chronicle*, *Empire News*, and of Allied's provincial and five other newspapers.

One month later, in February, Mr. J. S. Elias—later Lord Southwood—the one-time newspaper boy and printer's clerk who had become governing director of Odham's Press, Ltd., publisher of the *Daily Herald*, the *People*, *John Bull*, etc.—acquired control of the aristocrats of British periodical journalism, Illustrated Newspapers, comprising the *Illustrated London News*, *Sphere*, *Bystander*, *Tatler*, etc. Associated with him in the deal, which was said to involve something like £500,000, was Sir John Ellerman, of the Ellerman shipping line.

It is difficult to say to what extent the aggregate sales of British newspapers appreciated during 1937, since full figures are not available. The *Daily Herald* maintained that its net sales throughout the year exceeded 2 millions per day; the *Daily Express* announced a December average of 2,404,285 compared with the year's average of 2,329,099; the *Daily Mail's* December certificate showed an average of 1,602,209, compared with 1,717,133 for Dec. 1936; and the *News Chronicle* averaged 1,323,472 compared with the 1936 average of 1,327,561. The Dec. 1936 average of the *Daily Telegraph* was 530,300.

The first sales certificate issued for the combined *Daily Telegraph* and *Morning Post* was for October, and showed a figure of 630,000, or approximately 104,000 higher than the last previous certificate issued for the *Daily Telegraph* alone; the *Morning Post's* last issued figure was 116,734, being the average for July 1936–June 1937, inclusive. The end of the year saw the *Daily Telegraph* and *Morning Post's* December average at 634,743. *The Times* averaged 192,220 during the year, compared with 190,745 during 1936 and with 186,325 during 1935.

The most important press event in Germany was the formation of the semi-official concern, Vera, to acquire independent newspapers, and force them into subservience to the existing régime. Transference to Vera was not directly forced; but since, under the Press Law, only Nazi party interests can risk acquiring newspapers, the independent proprietor had no alternative to selling to Vera after suppression, censorship, and the impossibility of publishing anything except what is in the interest of the Government, had reduced the value of the property to nil. (L. H. D.)

**New York**, one of the original States of the United States, popularly known as the "Empire State"; area, 49,204 sq. mi. (1,550 sq. mi. water); population according to the U.S. census of 1930, 12,588,066, and on July 1, 1937, estimated at 12,959,000. Capital, Albany, 127,412. Other cities in the State with more than 100,000 residents in 1930 were: New York city,

6,930,446; Buffalo, 573,076; Rochester, 328,132; Syracuse, 209,326; Yonkers, 134,646; and Utica, 101,740. Of the State's population 10,521,952 are urban, or 83.6%; 9,958,744 native white; 3,191,549 foreign-born white; 412,814 Negro. The population density of 83.6 inhabitants per acre was exceeded only by Rhode Island and Massachusetts.

**History.**—The chief executive officers of the State during the year 1937 were governor, Herbert H. Lehman; lieutenant governor, M. William Bray; comptroller, Morris S. Tremaine; attorney-general, John J. Bennett, Jr. All are members of the Democratic Party. In the legislature there was a division of strength between the two major political parties. The senate consisted of 29 Democrats and 22 Republicans and the president pro tem was John J. Dunnigan, a Democrat. The assembly consisted of 76 Republicans and 74 Democrats and the speaker of the assembly was Oswald D. Heck, a Republican.

During the regular 1937 legislative session a total of 4,678 bills were introduced. Of those finally passed and sent to the governor, 927 were signed and became law and 272 were vetoed. The highlights of the session were the passage of a social security program, many important labour bills, the enlargement of the health program, the enactment of a "career" bill for State employees and the defeat of the Federal Child Labor Amendment.

Among the more important bills to become law in 1937 were: creation of a Labor Relations board to promote equality of bargaining power between employer and employee; establishment of a State board of mediation within the Labor department for the prevention and settlement of labour disputes; payment of income taxes by constitutional public officials of the State; regulation or prohibition of the transportation in New York of goods manufactured or produced with child labour; prohibition of duress, intimidation and coercion of employees through the means of the payroll envelope or otherwise; establishment of a division of minimum wage in the Labor department for women and minors; a permissive bill for women to sit on juries; extension for another year of the moratorium on mortgage foreclosures and the provisions of law relating to deficiency judgments; a "career" bill for State employees, providing for their classification within grades with annual salary increments, promotion to higher grades being made possible only after civil service examinations; provision for a million dollar revolving fund from which the State Mortgage Commission can advance moneys for the rehabilitation of properties against which mortgage certificates have been sold.

In addition, six proposed constitutional amendments were passed by the legislature and transmitted to the secretary of State for submission to the people at the general election of 1937. The following were approved and became part of the State constitution: An amendment making the term of governor and lieutenant governor four years, instead of two years; an amendment making the term of assemblyman two years instead of one year; an amendment permitting sheriffs to succeed themselves in office;

HERBERT H. LEHMAN, re-elected governor of New York for a third term

an amendment permitting a defendant in a criminal case to waive a jury trial except in those cases in which the crime charged may be punishable by death, and providing also that a verdict may be rendered by five-sixths of the jurymen in any civil case.

The legislature of 1937 refused to ratify the Child Labor Amendment to the Federal Constitution. In addition to this, the following important bills were killed or defeated in the legislature: legalization of pari-mutuel race track betting; reapportionment of senate and congressional districts; outlawing of sit-down strikes and requiring labour unions to file annual financial statements; establishment of a Department of Justice and Division of Crime Prevention in the State; repealing the requirement that teachers take an oath or affirmation to support the State and Federal Constitutions; state regulation of fee-charging employment agencies.

An extraordinary session of the legislature was called by the governor in December at the request of the mayor of the City of New York for the purpose of enacting a new municipal code. The code was enacted by the legislature and approved by the governor. The election of 1937 had a considerable effect on the political make-up of the State assembly. At that election 84 Republicans, 61 Democrats, 4 members of the American Labor Party and one American Labor Party-Republican were elected to the 1938 assembly.

**Education.**—State educational developments of 1937 were featured by a court decision upholding the right of the State Department of Education to exercise control over all institutions, by the discontinuance of the joint legislative committee investigating communism in the schools, by reorganization of the department into three main branches—education, higher education, and financial and administrative, by legislation extending the principle of teacher tenure to village school districts having a population of 4,500 or over and employing superintendents of schools, and by legislation extending the scope of education through making definite provision for instruction in highway safety and traffic regulation. Brief statistics for 1936 indicated that over two and a quarter million of a school population of 3,918,047 attended public schools valued at \$1,005,842,381 and were under the direction of 87,234 teachers.

Detailed statistics for 1935-36 released during the year revealed that at that time there were 11,218 public schools including 997 high schools, 163 universities, colleges and professional schools. Public school expenditures totalled \$327,228,386 of which \$119,729,480 was contributed by the State. Enrolment figures were: all public schools, 2,292,497, including for high schools, 654,312; private schools (273 reporting), 90,317; all universities, colleges and professional schools, 138,973.

**Charities and Correction.**—Statistics for the fiscal year 1936-37 indicate the importance of New York State institutional activities. Of non-educational expenditures during that year, the Departments of Mental Hygiene, Public Works, Social Welfare and Correction consumed almost one-half. At this time there were 82,825 inmates in mental institutions, 10,762 in State prisons, 2,104 in reformatories and 1,475 in institutions for defective delinquents.

**Finance.**—The financial situation of the State continued to improve during 1937. On June 30, 1937, the accumulated State deficit had been reduced to \$10,198,452, having been reduced over \$40,000,000 for each of the last two fiscal years. Receipts of \$360,870,831 for the fiscal year 1936-37 were nearly \$20,000,000 over the official estimate and more than balanced the expenditures, which amounted to \$315,191,127. The leading source of revenue was the personal income tax which produced \$104,892,155. Other important levies in the order of their yield were motor fuel, \$43,584,556; motor vehicles, \$35,470,820; stock

transfer, \$33,847,471; inheritances and estates, \$33,580,613; corporations, \$30,860,589; franchises, \$27,515,380; and alcoholic beverages, \$13,102,400. Nearly one-half the expenditures (\$149,78,982) were devoted to local purposes. Purely State expenditures were largely for State institutions (\$50,315,031), debt service (\$46,712,520) and administrative expenses (\$34,430,389). The State's net debt was \$547,673,716. Of this, \$144,855,000 was for unemployment relief; \$63,634,795 for canals; \$46,354,873 for highways; \$85,510,000 for grade crossing elimination; and \$70,99,000 for general State improvement.

Property within the State was assessed at \$25,548,805,000 for 1937 representing a true value of \$30,254,216,000; but there was no State property tax. Three important tax measures were passed during the year—an increase in the gasoline tax from three to four cents a gallon, a 2% tax on public utility gross receipts and repeal of clauses exempting State constitutional officers from the State income tax assessment.

**Banks.**—On June 30, 1936, New York State had 911 banks. Of this total, 458 were national and 453 were State banks (included in this figure for State banks are banks, trust companies, savings banks and private banks). The combined capital of these banks was \$925,878,000, the total resources were \$23,174,205,000 and deposits amounted to \$19,792,598,000.

**Agriculture.**—The latest census (1935) reveals that New York possessed 177,025 farms, covering 18,685,741 ac., with land and buildings valued at \$1,045,391,981. The estimated cash farm income from sales of crops and livestock and livestock products, in 1937, was \$310,450,000, which placed New York ninth among the United States in sales value of farm products. New York ranked third in the country in milk output, during 1936, with 887,600,000 pounds. Leading crops were truck crops, with farm cash income in 1937 of \$25,180,000; orchard and vineyard fruits, including apples, peaches, pears, cherries and grapes, \$20,325,000; potatoes \$14,850,000; other crops \$41,845,000. Income from livestock and livestock products in 1937 totalled \$208,250,000, the most important sources being milk, cattle and calves, poultry and

important crops produced in 1937 were: Corn for grain, silage and fodder, 23,856,000 equivalent bushels; wheat, 8,276,000 bu.; oats, 18,800,000 bu.; buckwheat, 2,448,000 bu.; hay, 5,749,000 tons; dry edible beans, 1,264,000 sacks of 60 lbs.; potatoes, 28,700,000 bu.; apples, 24,700,000 bu.; peaches, 1,806,000 bu.; pears, 1,050,000 bu.; grapes, 89,100 tons; cherries, 21,750 tons.

**Manufacturing.**—According to statistics released by the United States Census Bureau in July, 1937, New York had 33,638 industrial establishments in 1935 employing 895,991 people and paying \$1,018,243,211 in wages. Manufactured products for the year were valued at \$6,094,393,038. The leading industry was men's clothing with a product valued at \$883,375,777. This was followed by printing and publishing (\$496,339,171), men's clothing (\$372,054,753), bread and other bakery products (\$222,795,954), and motor vehicles and parts (\$214,791,230).

**Minerals.**—Excluding mineral products manufactured in the State from material mined in other States, New York's mineral output was valued at \$58,408,999 for 1935. The leading items were petroleum, \$9,080,000; stone, \$7,420,225; clay products, \$63,916; and cement, \$6,612,399; while the production of natural gas, sand and gravel, gypsum, and salt exceeded five million dollars in each case.

**Transport and Commerce.**—New York far surpassed the other States of the United States commercially. The U.S. Customs Office reports that in 1935 the value of goods imported at customs offices in the Port of New York district amounted to \$33,125,000 or 50.67% of the total for the nation. During the year imports in the St. Lawrence district, which includes all

New York State ports on the river, were valued at \$21,493,000 and imports at the Buffalo and Rochester districts were valued at \$75,043,000 and \$3,841,000, respectively. Exports for the year from the Port of New York district amounted to \$790,336,000 and constituted 34.62% of the total for the nation. Exports in the St. Lawrence district during 1935 amounted to \$25,803,000 and in the Buffalo and Rochester districts were \$59,805,000 and \$5,299,000 respectively. Traffic on State canals during 1936 exceeded 5,000,000 tons.

During 1936 there were 2,514,041 motor vehicles registered in the State, with 2,792,242 operator and 747,626 chauffeur licences issued. Roads in the State covered 84,170 mi. on January 1, 1937. Of the total, 50,285 mi. were improved and work was performed on 2,232 mi. during the year 1937.

(H. H. L.)

**New York City.** For its 7,400,000 residents, 360,000 daily commuters and 100,000 daily visitors New York city's Government set several new achievement records in 1937 and incidentally threw into the arena of national politics two possibilities for presidential nomination in 1940—the re-elected mayor, Fiorello H. La Guardia, and the newly elected district attorney for New York county, Thomas E. Dewey. So notable, however, were the service gains and the improvements in reporting them that even if La Guardia and Dewey had been defeated, 1937 would have been a notable year. Twenty district health centres were organized for progressively educating the people against mortality and sickness. Safe milk was cheapened. Four key death rates—mothers in childbirth, infants, typhoid and tuberculosis—were reduced to New York's lowest, despite extensive unemployment, relief, poverty and overcrowding in unfit and inadequate housing. Typhoid was so rare that it was hard to find cases for training young physicians. Infant mortality was 43.7 in a thousand; it was 100 in 1900.

Emergency relief became a municipal activity. For all home relief but mothers' pensions, an experimental concentration was ordered under one set of workers where formerly each type had its separate staff—family, old age security, veterans, blind, etc.

An experimental high school for specially talented children was started. The need for additional vocational and trade schools was recognized in both operating and capital budgets. Anti-Tammany members gained control of both the education and the higher education boards. A fourth city college was started. An efficiency self-survey of the four colleges was begun, and a fifth city college promised. The radio station WNYC was enlarged and gave more attention to government.

Specially trained assessors of utilities and railroads were added to the city staff after nation-wide competition, in order to increase taxable valuations. Machines partly displaced hands in writing 14,000,000 yearly property descriptions and tax computations. General real estate valuations were widely above sales levels; inequitably low assessments were also extensive, Columbia university netting 10.3% on the tax valuation of leased Rockefeller Center lands assessed at \$32,000,000, while other properties netting nothing or 3% were legion. Governor Herbert H. Lehman declined to hear charges against Mayor La Guardia of inequitable and inefficient assessing.

Budget appropriations for 1938 rose to over \$682,000,000; over \$93,000,000 of appropriations being omitted from the advertised "budget." Emergency taxes remained, including a half-cent increase in water rates. Gross debt rose to almost \$2,400,000,000; net debt to \$1,908,000,000; borrowing margin fell to \$81,000,000.

Civil service expanded and was strengthened in 1937. Party-named election inspectors and clerks were compelled to qualify by examination. Emergency relief workers were denied exemption from competitive examination. Scholarships at engineering

colleges were given to firemen and sanitation employees ambitious to qualify for higher posts. "In-service" training with civil servants was started by several departments. Eligibles for patrolmen were certified for firemen to save examination costs. Important disputed questions were settled by the highest court. A nine-point operation-research program was advanced. Increased co-operation with universities was outlined and a university director of studies into civil service efficiency was made civil service secretary. An electric scoring machine was introduced which scored 800 short-answer examinations per hour. A lower court ruled twenty-five an unreasonable age maximum for stenographer applicants. Former Mayor Walker's restoration to the city payroll with resulting pension after short service was prevented by popular indignation and a taxpayer's suit. Professional examiners' salaries were increased. Mandatory salary increments for city workers under \$2,400 began. Pre-depression pay rates were restored. Hospital nurses won an eight-hour day.

Public works multiplied—parks, playgrounds, riverways, bridges, tunnels, subways. The old eye-sore City Hall post office was abandoned for early destruction. Several enclosed markets displaced push-cart markets. A new "Tombs" prison was ordered. Extensive slum-clearance projects were arranged with Washington and two were opened. A new water system to take water from the Delaware river was attacked in court as a \$750,000,000 superfluity.

A new charter took effect in 1937: department heads must henceforth work full time and have no other remunerative employment, unless unsalaried; a council of 26 was elected in place of an aldermanic board of 65; the council was elected by proportional representation within boroughs with minorities winning half the seats; a city planning commission will substitute a master-plan for present hit-or-miss building under special pressures; public works go under a single head, who will supervise through borough deputies; building and housing inspection are under one commissioner, the tenement house department disappearing; an appointive treasurer with accounting duties supplants the former chamberlain; the comptroller audits and "controls"; an administrative code of former charter provisions, laws and ordinances—3,350 pages—supplements and implements short-charter powers; an assistant mayor will free the mayor from many details.

Politically 1937 marked several revolutions. The mayor pledged himself to make New York a "union city." Labour unions made him mayor again. Picketing was ubiquitous; a grand jury denounced it as a nuisance and an injury to business. Police interfered with sit-down strikes only if employers so demanded. A five-day week for city employees was vetoed, not for economy but because as voted it meant a four-day week for many. City

officers helped organize the American Labor Party in favour of the mayor; two national labour groups gave the mayor 30,000 more votes under the labour emblem than his plurality of 453,000. They also drove Tammany out of the prosecutor's office in New York county; an aide of the special prosecutor and racketeer, Dewey, was named commissioner of investigation by the mayor and told to do for other counties what had already been done for New York county.

Tammany's defeat was so complete, except for councilmen, that its mayoralty candidate said later that the only way to salvage the Democratic Party in New York was to drop the name Tammany and move headquarters to a new locality with new connotation. The routing of Tammany by the labour-Republican-fusion coalition, and by its own illiterate and shallow campaign, despite support by national and State Democratic machines, killed two pernicious adages—that in New York a reform mayor never succeeds himself and that even an indignant public does not want anti-Tammany prosecutors. (See also TAMMANY HALL.)

(W. H. AL.)

**New York University** attained a record enrolment in 1937 of 43,510, including 7,000 liberal arts, 7,200 graduate, and 24,000 professional students. A private institution, supported partly by endowment and largely by student fees, it operated for the seventh consecutive year on a balanced budget, with nearly 90% of the aggregate expenditure of fifty-one and a half million dollars of the seven-year period covered by fee revenue. While adhering to traditional university concepts and practices, New York university has stressed ever since its establishment in 1831 the pragmatic features of its program through consistent integration of its activities with the practical affairs of everyday life. Its College of Engineering, for example, has just entered upon a co-operative program with the city of New York for training sanitary engineers. The medical school is expanding its work in public health and nursing by similar co-operation. The School of Retailing is offering a combined program of alternate study and employment in co-operation with eighteen great metropolitan stores. In the enormously developing field of adult education the Division of General Education has conducted within the year 113 courses at fifty-four centres in five states in co-operation with local authorities. The university acquired six additional buildings in 1937. (H. W. CH.)

**New York World's Fair:** see FAIRS AND EXHIBITIONS.

**New Zealand, Dominion of,** a self-governing member of the British Commonwealth of Nations, situated in the southern hemisphere about 1,200 mi. to the south-east of Australia. The main group of three islands lies between lat. 34° 30' S. and 47° 10' S., and long. 166° E. 179° W. Outlying islands within the jurisdiction of New Zealand include Auckland islands (uninhabited), Chatham islands, Cook islands, Niue, Kermadec islands (mostly uninhabited), Ross Dependency in the Antarctic (between long. 160° E. and 150° W., and south of lat. 60° S.), and the Union (Tokelau) islands. Capital, Wellington (North island); ruler, King George VI, (*q.v.*), represented by a governor-general, Viscount Galway, G.C.M.G.; national flag (merchant ensign), a red ensign, with the Union Flag in the quarter and four white stars in the field.

**Area and Population.**—Area: North island, 44,281 sq. mi.; South island, 58,092 sq. mi.; Stewart island, 670 sq. mi.; Chatham islands, 372 sq. mi.; Auckland and other neighbouring islands, 30 sq. mi.; Cook and other South Pacific islands, 180 sq. mi.; Niue, 100 sq. mi.; Kermadec and Tokelau islands, 17 square miles. Pop.

INFANT MORTALITY rate in New York city (deaths under one year per 1000 births)

lation: (March 1936 census) North island, South island, Stewart island, with islets, and Chatham island, 1,573,810, including 2,326 Maoris; Cook group, 16,350; Tokelau island, 1,170; Kermadec island, 2; est. pop. (June 1937), New Zealand proper, 587,211, including 84,474 Maoris; urban pop. (1936 census), 9.5%. Leading cities (pop., April 1937): Auckland (q.v.) 214,400, Wellington 151,700, Christchurch 133,200, Dunedin 82,100.

**History.**—Labour Cabinet: prime minister, minister of external affairs, native minister, etc., M. J. Savage; minister of education, health, etc., P. Fraser; minister of finance, customs, marketing, etc., W. Nash; minister of industries and commerce, railways, etc., D. G. Sullivan; attorney-general, etc., H. G. R. Maori; minister of labour, etc., H. T. Armstrong; minister of internal affairs, etc., W. E. Parry; minister of mines, etc., P. C. Webb; postmaster-general, etc., F. Jones; minister of agriculture, etc., W. Lee Martin; minister of lands, etc., F. Langstone; without portfolio, M. Fagan; parliamentary under-secretary in charge of housing, J. A. Lee. The legislature consists of a legislative council of 38 members, nominated by the governor-general, and an elected House of Representatives of 80 members, including four Maoris elected by native voters. There was no general election in 1937.

The most important internal developments were in the social and economic field. A serious strike of workers in freezing works at Auckland was ended on terms favourable to the workers. The Government's housing program aiming at the building of 2,500 houses in 1937 and 5,000 per annum thereafter, was pressed forward.

**Trade, Industry, and Communications.**—The gross value<sup>1</sup> of farm produce in 1935–36<sup>2</sup> was £60,500,000, comprising: agricultural produce, £7,400,000; pastoral produce, £28,800,000; produce of dairying, poultry and bees, £24,300,000. Value of lumber exported (1936), £366,350. Value of fish exported (1936), £31,677. Value of mineral production (1936): gold, £1,272,587; coal, £2,140,217. Exports (1936–37)<sup>3</sup>: £64,600,000, including £18,800,000 worth of wool. Imports, £50,100,000. Of the trade balance of £14½ millions, only about £10 millions was required for debt service, but bank funds abroad fell by £7 millions, suggesting a net outflow of capital.

The gross output of factory industry was valued at £90,014,748 in 1935–36, the added value being £30,074,355. Food industries accounted for £50,704,917 of the gross total and for £9,386,357 of the net. The number of unemployed at Sept. 25, 1937, was 36,450. The railway mileage open in March 1937 was 3,509 mi., of which all but 189 mi. was Government owned. Railway operating revenue in 1936–37 totalled £6,903,604, and operating expenditure £6,338,385. The mileage of paved or surfaced roads was 1,834 mi. at March 31, 1936, including 12,114 mi. of main highways whose maintenance cost £1,096,754 in 1936–37.<sup>3</sup> Steam and motor tonnage on the New Zealand register at Dec. 31, 1936, totalled 183,005 tons gross and 96,405 tons net. Excluding coast-guard vessels, 2,889,708 tons of shipping were entered into New Zealand ports in 1936. During the 1937 Imperial Conference (q.v.), the United Kingdom, Australian and New Zealand Governments discussed the problem of competition from subsidized American ships on the trans-Pacific routes.

Internal air services have advanced rapidly during the past two years. Their route mileage at June 1937 was 1,623 mi., and their operating mileage in 1936 was 897,106 miles.

**Banking and Finance.**—The New Zealand pound (£NZ) (with sub-units as in English money) had throughout 1937 a value 20% below that of sterling, i.e. approximately 16s. sterling. The currency reserve consisted (Dec. 20, 1937) of £2,800,000 (nominal)

of gold and £16,880,000 of sterling exchange, the ratio to all sight liabilities being 70.8%. The active note circulation in Sept. 1937 was £9,300,000; commercial bank deposits, £65,100,000.

The national accounts for 1936–37 (budget year ends March 31) closed with a surplus of £472,000, expenditure totalling £30,675,000 and revenue £31,147,000. The minister of finance, in his budget speech on Sept. 28, forecast an increase of revenue to £34,778,000 in 1937–38, and of expenditure to £34,427,000. Social services (excluding unemployment relief) would cost £12,168,000 instead of £9,913,000, and defence would cost £1,600,000 instead of £1,192,000. The public works program was raised to £17,367,000. Taxation was unchanged.

**Defence.**—The New Zealand division of the Royal Navy, maintained by the Dominion Government and manned in the lower ranks by New Zealand personnel, consists of two cruisers and smaller vessels. There is a very small permanent land force, including 106 officers and 436 instructors. The strength of the volunteer territorial force on Aug. 1, 1937, was 8,282. The air force similarly comprises a permanent cadre and a voluntary territorial force. It was reorganized in 1937; a reserve of pilots was established, and a scheme of short-service commissions in the Royal Air Force for New Zealand pilots was inaugurated.

**BIBLIOGRAPHY.**—W. B. Sutch, *Recent Economic Changes in New Zealand*. (H. V. H.)

**Nicaragua**, a Central American republic; language, Spanish; capital, Managua; president, Anastasio Somoza. The area is 49,200 square miles. Population (estimated, 1935) 638,119. The chief cities are: Managua (60,342); León (47,234); Granada (18,000). President Somoza took office Jan. 6. In August, when Nicaragua issued a stamp showing her interpretation of the Honduras boundary line a two-year dispute with Honduras was brought to a head, with threatened hostilities on the border. Costa Rica, the United States, and Venezuela proffered mediation, with the result that on December 10 the two disputants agreed to accept arbitration. In July attention was focused again on the proposed Nicaragua canal when President Somoza offered the United States military privileges in return for funds with which to canalize the San Juan river. Nicaraguan agriculture suffered heavily from a locust plague of several months duration. By November it was reported that half the cotton, corn, rice, and bean crops had been destroyed.

Rising prices, augmenting living costs, and tight credits kept business at a low level throughout 1937. Nevertheless, in December, President Somoza announced a balanced budget and promised agricultural relief. Nicaragua has 171 mi. of Government-owned railroad, and an undetermined amount of short privately-owned lines. There are approximately 900 mi. of highways. In Nov. 1937, the Government called for bids for further highways to be constructed over a period of years at a cost estimated at \$10,000,000. Imports for 1935 totalled \$5,072,876, exports \$5,658,113, representing a 9.1% increase. Principal imports are textiles, foodstuffs, and machinery; principal exports are coffee, bananas, gold. Foreign trade is largely with the United States. In 1936–37, the total United States trade aggregated nearly \$6,000,000, an increase of one-third. The monetary unit is the cordoba (value: approx. 41.5¢ U.S.). There are approximately 700 schools, with an enrolment of about 44,000. Budgetary allotments from the Government are very small. (L. W. BE.)

**Nickel.** The world total nickel output, 90% of which is from Canada, was 60,200 metric tons in 1929, dropped to 19,500 tons in 1932, and increased to about 88,000 tons in 1936. Of the minor production, New Caledonia averages about 5,000 tons annually; Greece, India and Norway range from 1,000 to

<sup>1</sup>Unless otherwise stated, values are expressed in New Zealand currency.

<sup>2</sup>Year to June 30.

<sup>3</sup>Year ended March 31.

1,500 tons; the Soviet Union started production in 1934, and has increased to an output of about 2,000 tons; and Brazil, starting in 1933, has reached 500 tons. The United States has no primary nickel production, but turns out 100-500 tons yearly as a by-product in copper refining. The Canadian output dropped from 50,000 tons in 1929 to 13,800 tons in 1932, with a recovery to 77,000 tons in 1936, and another new record high of just under 100,000 tons in 1937.

The normal trend of industrial recovery has been supplemented by a rapidly increasing demand for nickel alloy steels, especially stainless steels, and by the demand arising from the ever-expanding rearmament programs. The increasing consumption of the metal encourages the development of new sources, in spite of the dominant position of the established Canadian producers, and active efforts toward commercial operation are being made on deposits in British Columbia and Celebes (Netherlands East Indies). (G. A. Ro.)

**Niemöller, Martin** (1892- ), German theologian, born at Lippstadt in Westphalia on Jan. 14, 1892; son of Pastor Henry Niemöller. Distinguished during the World War as a submarine commander, he later turned to farming and then to theology, and eventually became pastor of the wealthy Dahlem parish of West Berlin. As an ardent nationalist and opponent of communism, Niemöller at first welcomed National Socialism and even joined the party, but in the summer of 1933 events turned him into a defiant opponent of the Nazi effort to bring the Lutheran Church under the domination of the Totalitarian State. The Protestants had drawn up a new constitution for a united Protestant Church and a committee chose the highly-respected Friedrich von Bodelschwingh as its Reichs Bishop. The Nazis rejected him, insisted on a national Protestant election, and by using strong-arm methods and the votes of people who never went to church elected Hitler's candidate, Ludwig Müller, an army chaplain but hardly a suitable man to be Reichs Bishop. Niemöller also objected to the placing of Alfred Rosenberg with his pagan "Myth of the Twentieth Century" in charge of the Nazi party's cultural affairs, and to the capture of the church youth organizations by the neo-pagan Hitler youth leader, Baldur von Schirach. Niemöller therefore formed the Pastor's Emergency League of some 7,000 Protestant pastors, became the leader of the more defiant wing of the opponents of Nazi control over religion known as the Confessional Church (*Bekennniskirche*), and helped draw up its famous "Six Principles" at the Synod of Barmen in May, 1934. His theology is the Gospel of Jesus as it is laid down in the Holy Scriptures and Protestant creeds or confessions of the 16th century. He continued to preach courageously at Dahlem against Nazi totalitarian control over the church until July 1, 1937, when he was arrested and imprisoned. Although 120 other imprisoned pastors were set at liberty on Christmas Eve, 1937, Niemöller was not among them; presumably the Nazis did not dare bring him to trial until religious and political passions abated. See GERMANY; and Niemöller's autobiography, *Vom U-Boot zur Kanzel* (Berlin 1934), and his collected sermons, *First Commandment* (LONDON 1937). (S. B. F.)

**Niger:** see FRENCH WEST AFRICA AND THE SAHARA.

**Nigeria.** A British crown colony and protectorate in West Africa on the northern shore of the Gulf of Guinea, bounded W. by Dahomey, N. by the French Niger colony, and E. by the Cameroons. The British mandated territory of the Cameroons (*q.v.*) is united with it for administrative purposes. The territory in the neighbourhood of Lagos forms the colony of

Nigeria; and two groups known as the Northern and Southern provinces form the protectorate. Government is "indirect" through native authorities, the most important of these being the emirs of Kano and Sokoto. Governor, Sir B. H. Bourdillon, K.C.M.G., K.B.E. Capital, Lagos.

**Area and Population.**—Total area, including the Cameroons, 372,674 square miles. (Colony 1,381 sq.mi.; Northern provinces 281,778 sq.mi.; Southern provinces 89,515 sq.mi.); total pop. 19,928,171 (Colony *c.* 333,000, Northern provinces, *c.* 11,303,500; Southern provinces *c.* 8,140,600). The principal towns are Lagos, Port Harcourt, Kano, and Calabar. Northern Nigeria is preponderantly Mohammedan. The two Boards of Education for the north and south ensure a unified system between the education department, the missions, and native administrations. There is a higher college at Yaba, and two Government middle schools at Ibadan and Umahia which, with King's college, Lagos, provide candidates for the higher college.

**Trade and Communications.**—The Nigerian railway has a length of 1,905 miles. The Western line runs from Lagos to Nguru; the Eastern starts from Port Harcourt and joins the Western at Kaduna. There are 3,775 mi. of gravelled roads usable in all seasons; a Government telegraph system; 21 telephone exchanges and 4 trunk lines. A radio distribution service by land line was inaugurated in Dec. 1936. Work has started on aeroplane landing grounds at Maduguri, Kano, Kaduna, Minna, Oshogbo, and Lagos.

Apart from a motor transport strike at Lagos in mid-January, few events of note occurred during 1937. Nigeria decided to contribute £75,000 to the cost of the British rearmament program; and on March 31 the first conference of the native rulers of the Southern provinces took place, on the lines of the provedly useful conferences between Northern rulers.

Prices of produce advanced during 1936; record tonnage was reached in the export of palm oil, palm kernels, cocoa, and cotton lint. Total exports for 1936 were valued at £11,601,223, and imports at £7,735,622. British silver coins, and West African currency Board Notes and coins are in circulation. Revenue for 1936 was £5,305,104, and expenditure £4,823,650.

**Nine-Power Conference.** This conference originated in the League assembly's resolution of Oct. 6, which invited League members, signatories of the Nine-Power Treaty of 1922, to consult together as provided in that treaty, regarding the Chinese-Japanese conflict. In the hope of securing Japanese participation, the Belgian Government was asked, at the suggestion of the United States, to hold the conference at Brussels, and on Oct. 15 invitations were issued, on behalf of the British and U.S. Governments, to all signatories of the treaty—China, Japan, Belgium, France, Italy, the Netherlands, Portugal, U.S.A., the United Kingdom and the Dominions (signatories by virtue of the Statute of Westminster), and subsequent adherents—Bolivia, Denmark, Mexico, Norway, and Sweden. The Japanese declined this invitation on Oct. 27, saying that the League had failed to take account of Japan's "just intentions" and had cast reflections on her honour. Germany and the U.S.S.R. were then invited, only the latter accepting.

The conference opened on Nov. 3, and the principal speakers (except the Italian and Soviet delegates who, though for different reasons, were sceptical of the conference's value) stressed the importance of Japan's collaboration in the search for a peaceful solution of the conflict, and emphasized their direct interest in the restoration of stable conditions in the Far East.

The suggestion of a small mediation committee having failed to gain acceptance, the conference despatched on Nov. 6 a final appeal to Japan to reconsider her decision, reasserting the right of

the other signatories to consult together. The Japanese Government replied negatively on Nov. 12, declaring that intervention by third parties would only excite public opinion and render a solution more difficult, but giving an assurance that the interests of third parties would be respected.

Its efforts to conciliate Japan thus rebuffed, the conference, on Nov. 15, adopted a declaration, by 15 votes to 1 (Italy), with Denmark, Norway, and Sweden abstaining, stating that there was no warrant in law for the Japanese aim of changing by armed force the policy of China, and that the powers must consider what was to be their common attitude in the circumstances.

The conference adjourned on Nov. 24 *sine die*, after adopting a report on its work and a declaration reiterating the general principles already enunciated. Provision was made for its recall should the chairman or members so recommend. (See also CHINESE-JAPANESE WAR; INTERNATIONAL LAW: *War in China*.)

(S. A. HE.)

**Nitrates.** There are small deposits of nitrate-bearing earth or shale in China, Egypt and Spain, which are locally used to a small extent for fertilizer, and an output of 6,000-8,000 tons of potassium nitrate in India, but the only natural nitrates exploited on an extensive scale are the caliche beds of northern Chile, which carry 10-25% of sodium nitrate, and which supplied the bulk of the world's nitrate requirements for a century. The maximum output attained was 3,238,000 metric tons in 1929, declining to 439,000 tons in 1933, with a recovery to about three times that amount in 1936. In addition to the general industrial depression, the Chilean industry faced even more troublesome factors in the development of other sources of nitrogen, particularly that recovered in the by-product coking of coal and the synthetic product derived from the nitrogen of the air. Although the beginnings of these competing sources date back to before the World War, the first real progress was an outgrowth of the war, when Germany was cut off from supplies of Chilean nitrate, and was forced to push the development of the synthetic processes. Steady progress was made following the war, spreading to other countries, and the combination of these forces gradually wore down the natural nitrates industry to a point where in 1929 it furnished only 23% of the world supply, and then the depression finished the job, with Chilean nitrate in 1933 supplying only 4% of the total. The construction of synthetic plants has now reached a point where their capacity is more than sufficient to supply the entire demand for combined nitrogen, and the natural nitrate industry survives only through the tolerance of its synthetic competitor.

(G. A. Ro.)

**Nobel Prizes.** The following awards were made in 1937: *Physics*—Dr. Clinton J. Davisson of New York, and Prof. George P. Thomson of London, for experimental discovery of interference phenomena in the irradiation of crystals by electrons.

*Chemistry*.—Prof. W. N. Haworth of Birmingham, for research on carbohydrate and vitamin C, and Prof. Paul Karrer of Zürich for research on carotinodes and flavins and vitamins A and B<sub>2</sub>.

*Medicine*.—Prof. Albert von Szent Gjörgé, University of Szeged, Hungary, for research in connection with vitamin C.

*Literature*.—M. Roger Martin du Gard, French novelist and critic, author of *Les Thibault*.

*Peace*.—Viscount Cecil of Chelwood, president of the League of Nations Union. (See also LITERARY PRIZES.)

**Non-Intervention Committee.** The Non-Intervention Committee was formed to implement the agreement not to intervene in the Spanish Civil

DR. CLINTON JOSEPH DAVISSON, co-winner of the 1937 Nobel Prize for physics

War, which, on French initiative, had been reached among the leading European Powers. The Committee's meetings have been held in London, the first of them being held early in Sept. 1936. Twenty-six nations were represented at the first meeting, and this number was later brought up to 27 by the adhesion of Portugal. The British Foreign Secretary, Mr. Eden was elected chairman, but at most of the meetings Lord Plymouth has deputized for him; members of the Committee, other than the United Kingdom, have normally been represented at it by their respective *Chefs de Mission* in London. One of the Committee's first decisions was to appoint a Chairman's Sub-Committee to assist the chairman in day-to-day work, the members being Belgium, the United Kingdom, Czechoslovakia, France, Germany, Italy, Sweden, and the Union of Soviet Socialist Republics. This Sub-Committee is composed of those Powers, other than Portugal, who, by reason of their importance, geographical position, or the size of their armaments industry, are most directly concerned with the policy of non-intervention; and in fact some of the most important discussions have taken place in this Sub-Committee.

The Committee's history cannot be understood without reference to political factors and the progress of the Civil War itself. Its proceedings have been dominated by Germany's and Italy's unfeigned support for General Franco, by Russia's equally open preference for the Spanish Government, by France's sympathy with the latter, and by the United Kingdom's unswerving but uneasy neutrality. Definite results have been farthest off when a definite decision in the war has been in sight, and nearest when the military situation has suggested a stalemate.

The first substantive question with which the Committee had to deal was to ascertain what legislative measures had been taken to give effect to the ban on the export of arms and munitions to Spain, and on the recruitment, enlistment, and transport of volunteers for service there. This led to the even thornier problem of obtaining, amidst flagrant breaches of the Non-Intervention Agreement and the atmosphere of suspicion which they engendered, agreement to the principle of a system of supervision; and when this was reached, early in 1937, it was some time before agreement was attained on the scheme itself. The abandonment of the Soviet claim to participate in a naval patrol led to the adoption of a scheme whose essential features were: (1) a corps of British observers to watch the Portuguese frontier; (2) a corps of international observers on the Pyrenees frontier; (3) control of coasts by (a) naval patrols supplied by the fleets of Great Britain, France, Germany, and Italy, (b) observers to be carried by the

"EUROPE'S PUBLIC WORKS PROJECT NO. 1," seen by Messner in *The Rochester Times-Union* as a ticklish job that worried Britain and France

ships of the participating countries when bound for Spanish ports; (4) a Non-Intervention Board to administer the scheme.

This scheme came into force in April, but, following the bombing of one German cruiser employed in the patrol and an alleged torpedo attack on another, Germany and Italy withdrew from the naval patrol, and the frontier controls were suspended. After prolonged negotiations, a compromise basis for the renewal and control proposed by Great Britain has been accepted. This involves (1) the stationing of international officers in Spanish ports; (2) the sending of a Commission to Spain to arrange and supervise the withdrawal of non-Spanish nationals; (3) the grant of belligerent rights at sea to the combatant parties when the Commission reports that satisfactory progress has been made with this withdrawal. At the moment of writing (Jan. 1, 1938) technical sub-committees are at work on the administrative details necessary to carry the new scheme into effect.

(W. T. WE.)

**Norris, William Foxley** (1859-1937), K.C.V.O., D.D., British clergyman; born Feb. 4. He was educated at Charterhouse and Trinity college, Oxford, was ordained in 1882, and was successively vicar of Shirburn, Oxon. (1886), and of Almondbury, Yorks. (1888), rector of Barnsley (1901), and archdeacon of Halifax (1906). From 1917 to 1925 he was dean of York, and in 1925 was appointed dean of Westminster. Upon his shoulders fell a very large proportion of the burden of preparation for the coronation ceremonial in 1937.

The dean was a fellow of the Society of Antiquaries, and was created a C.V.O. in 1929, and a K.C.V.O. in 1934. His successor as dean of Westminster, appointed on Nov. 17, is the Rt. Rev. P. F. D. de Labilliere, suffragan-bishop of Knaresborough. He died Sept. 28, 1937.

**North Carolina**, popularly known as the "Old North State" or the "Tar Heel State"; area, 52,286 sq.mi.; population according to the U.S. census of 1930, 3,170,276, estimated July 1, 1937, 3,492,000. Capital, Raleigh, 37,379; Charlotte, the largest city, 82,675. Of the State's population in 1930, 809,847 (25.5%) were urban; 918,647 (29%) Negroes; 2,251,629 whites; 8,788 foreign born.

**History.**—On Jan. 7, 1937, Clyde R. Hoey, Democrat, was inaugurated as governor. The biennial legislature, meeting in January-March, rejected the proposed Federal amendment empowering Congress to prohibit child labour, but raised the prohibitory age for employment of children in industry to 16 years, with certain exceptions, and to 18 years for certain hazardous occupations. The first general labour law relating to maximum hours was enacted—48 hours a week for women and 55 for men, with many exceptions.

Under Federal stimulus, the State legislature established the North Carolina Unemployment Compensation Commission to administer a fund, raised from taxes of 2.7% on the payrolls of employers, from which unemployed workers may draw benefits of not more than \$15 a week for not exceeding 16 weeks a year. Also, the State Board of Charities and Public Welfare was charged with the administration of monthly benefits to the aged needy, the needy blind, and dependent children from funds supplied jointly by the county, State and Federal Governments. The legislature ended the reign of State prohibition since 1908 by establishing a county option-State control system under which 89 legal liquor stores in 27 of the 100 counties were opened during the year.

Constitutional amendments were ratified by popular vote in November, 1936, raising the limit of the income tax rate to 10%, limiting the annual or biennial increase of State and local debts (except by popular vote) to two-thirds of the amount by which the outstanding debts were reduced, and empowering the legislature to provide for two additional Supreme Court justices, to exempt from taxation homes to the value of \$1,000, and to classify real and personal property for taxation. The legislature classified intangible personal property at lower rates and raised the income tax rate to 7% on net income above \$10,000. Important State officers were: Clyde R. Hoey, governor; Wilkins P. Horton, lieutenant-governor; Thad Eure, secretary of state;

George Ross Pou, auditor; C. M. Johnson, treasurer; Clyde A. Erwin, superintendent of public instruction; A. A. F. Seawell, attorney-general.

During the summer there was held on Roanoke island a celebration of the 350th anniversary of the planting by Sir Walter Raleigh in 1585-87 of the first two English colonies in America. The celebration was featured by the periodic presentation of Paul Green's drama *The Lost Colony* and the visit and address by President Roosevelt on August 18, the anniversary of the birth of Virginia Dare in 1587.

CLYDE R. HOEY, governor of North Carolina, and Mrs. Hoey

**Education.**—North Carolina maintains separate public schools for whites, Negroes and Indians, with compulsory attendance from 6 to 13 years of age inclusive. In 1935-36, there were 4,347 public elementary and 936 high schools, with 24,235 teachers and 103,766 enrolment, operated at a cost of \$23,400,000 of which the State Government contributed \$20,223,211. The State appropriation for 1937-38 is \$23,796,367. The State maintained three branches of the consolidated University of North Carolina at Chapel Hill, Raleigh and Greensboro with an enrolment of 4,674 in 1936-37 as well as 12 standard and teachers' colleges for whites, Negroes and Indians. There were 41 private colleges for whites and Negroes.

**Banking and Finance.**—In 1936-37, State expenditures were \$90,147,013; receipts, \$98,901,797. The assessed value of real and personal property was \$2,199,517,988 in 1936. On June 30, 1937, the State bonded debt was \$161,934,000; 43 national banks had deposits of \$95,146,000, and 166 State commercial banks and trust companies, \$268,483,000. In 1937 there were 4,763 mi. of railroads; and the State Highway and Public Works Commission maintained 11,160 mi. of State highways and 47,428 mi. of county highways, of which 9,715 mi. were hard surfaced.

**Agriculture, Manufacture and Mining.**—In 1935, 2,632 manufacturing establishments employed 229,534 wage earners at wages of \$152,037,469 and made products valued at \$1,111,977,771. The leading industries were tobacco, cotton goods, knit goods and furniture. The mineral production was valued at \$7,502,567, chiefly granite, sand and gravel, feldspar, and ceramics. In 1936 the kilowatt-hour production of electricity in the State was 2,861,806,000. The value of the lands and buildings on the 300,967 farms in North Carolina in 1935, approximately half of which were operated by tenants, was \$622,134,983. The total cash agricultural income in 1937 from crops, livestock and livestock products, and Government payments was \$271,132,000—an increase of 21% over that of 1936, accounted for chiefly by tobacco, which was valued at \$154,800,000.

(A. R. N.)

**North Dakota,** North-central State of the United States and popularly known as the "Flickertail State." It has an area of 70,837 sq.mi. and a population of 706,000 (estimated July 1, 1937). The capital is Bismarck, population 11,090 (1930). Cities with larger population are: Fargo, 28,619; Grand Forks, 17,112; and Minot, 16,099. Of the population of the State 580,645 in 1930, 113,306 were urban, or 13.6%; 680,477 were white; 368 coloured; 576,058 native born; and 105,155 foreign born.

**History.**—Principal Officers of the State: Governor, Wm. A. Langer; Lieutenant-Governor, T. H. H. Thoreson; Secretary of State, Jas. D. Gronna; State Auditor, Berta E. Baker; State Treasurer, John Gray; and Attorney-General, Alvin C. Strutz.

**Education.**—At the last session of the legislature in 1937 it was provided by law that compulsory military training should be discontinued at the State university and at the Agricultural College. The biennial appropriations, 1937-39, for the institutions of higher learning were as follows: State university and school of mines, \$936,725; Agricultural college, experiment station and extension division, \$1,864,226; and three State teachers colleges, two Normal schools, the School of forestry and the School of science, \$1,506,421. The total enrolment in these institutions was approximately 7,000. The enrolment in high schools for the year ending July 1, 1937, was 33,428. For the same date the enrolment in all schools below the grade of high school was 11,574. The total expenditure for the support of all these schools for the year ending July 1, 1937, was \$10,674,249.

**Banks.**—On June 30, 1937, 138 State banks and two trust

companies operating within the State reported invested capital, including \$1,334,800 debentures held by the Reconstruction Finance Corporation, to the amount of \$5,267,392, and total resources of \$27,348,000. On June 30, 1936, 64 National banks operating within the State reported a total invested capital of \$6,770,000, which amount included preferred stock held by the Reconstruction Finance Corporation, and total resources of \$57,517,000.

The emergency relief appropriation for 1937 amounted to \$33,086,697. The principal Federal expenditures were for the WPA, for farm security administration and for public roads.

WILLIAM A. LANGER, governor of North Dakota

ranked second with 1,775,620 bushels.

In 1935 the total value of all manufactures was \$42,913,328, over one-half butter and flour. In 1935 the amount of lignite coal mined was 1,955,510 tons, valued at \$2,395,000. There was no other mineral product of any importance. (O. G. L.)

**Northern Ireland:** see IRELAND, NORTHERN.

**Northern Rhodesia:** see RHODESIA, NORTHERN.

**Northern Territory,** governed by the Australian commonwealth through an administrator; comprises Central Australia (capital, Alice Springs) and North Australia (capital, Darwin). It elects one non-voting member to the commonwealth House of Representatives.

**Area, Population, and Cities.**—Area: 523,620 sq.mi. European and Asiatic population (1937), 5,454. Aboriginal population (1935), 18,244. There are 15 aboriginal reserves, area, 67,244 square miles. Population of Darwin (1933 census), 1,566.

**History.**—Controversy was aroused by the appointment of Mr. C. L. A. Abbott, a member of the House of Representatives, as administrator. In April, the Government appointed a committee of inquiry into the Territory's resources and possibilities, consisting of Mr. W. L. Payne, chairman of the Queensland Land Administration board, and Mr. J. W. Fletcher, a Queensland pastoralist. Reporting in December, they declared that the Territory could have been better governed if it had been divided between adjoining States. Recommendations included the abolition for 20 years of the Territory's income tax, petrol tax, and all tariffs; the proclamation of Darwin as a free port; the construction of two railways into the Territory from Dajarra (Queensland) and Wyndham (Western Australia); exchange of cattle for sheep grazing, and the decentralization of the administration.

**Trade, Finance, and Communications.**—Production in 1936-37 was estimated at £499,000. Net payment from commonwealth budget was £611,000. Darwin gained income from its position as an airport, and a strategic base there was planned, to cost £400,000. (H. V. H.)

**Northwestern University** was founded in 1851, at a time when Chicago had a population of 28,000. The charter of the university provides that a majority of the board of trustees shall be members of the Methodist Episcopal Church, but no particular religious faith is required of those who attend.

The university has two campuses, one in the Chicago suburb, Evanston, where the undergraduate schools are located. Another campus, situated on Chicago's near north side, six blocks from the loop, is devoted to the professional schools.

For the year 1937-38 the enrolment of the university is as follows: 5,796 full-time students, of which approximately 1,300 are registered in the professional schools on the Chicago campus; 9,956 part-time and evening department students, most of whom are on the Chicago campus. The registration for the 1937 summer session was 4,694 students.

The faculty numbers 1,251, of whom 588 are full-time members. The total budget for the year 1937-38 is \$4,900,000, and the value of all land and buildings used for educational purposes is \$16,678,000.

During the year new buildings were constructed, or are in process of construction, as follows: five men's dormitories costing \$200,000, and a freshman women's dormitory costing \$600,000 for the Evanston campus; a \$2,000,000 building on the Chicago campus for the Wesley Memorial hospital, which is affiliated with the university.

Among new courses established by the university this year are (1) field courses in education, (2) an educational clinic, and (3) an experimental teaching program in several high schools of the Chicago area.

During the academic year ending July 30, 1937, the gifts to the university totalled \$5,153,000.

**North-West Territories** embrace all of the mainland, in Canada east of Yukon territory and north of the Provinces of Manitoba, Saskatchewan, Alberta and British Columbia; all of the islands in Hudson and James bays and in Hudson strait including Ungava bay; and all of the Arctic islands north of the mainland of Canada within the area bounded on the east by a line passing midway between Greenland and Baffin, Devon and Ellesmere islands, to the 60th meridian of longitude, following this longitude to the North Pole, and on the west by the 141st meridian of longitude, following this longitude to the Pole. In 1918, the territories were subdivided, for administrative purposes, into the provisional districts of Mackenzie, Keewatin, and Franklin. The land and water area is estimated at 1,309,682 square miles. The 1931 census shows a population of 9,723, composed of 4,670 Eskimos, 4,046 Indians and 1,007 whites.

The welfare of the native population is one of the chief responsibilities of the administration. Consequently the conservation of the wild life of the region, upon which the natives depend for subsistence, is of prime importance. An aggregate area of 514,557 sq.mi. has been set aside for game preserves and sanctuaries. Three thousand domesticated reindeer were purchased in Alaska in 1929 and herded overland. The herd now numbers over 4,000 head. Each year animals, surplus to the needs of the herd, are slaughtered and the meat made available for mission hospitals and residential schools, relief, sale, and for use at the reindeer stations.

The fur trade has been for many years the most important industry in the territories and the production of furs is still the principal occupation of a large proportion of the population. For

the licence year ending June 30, 1936, the number of pelts taken was 211,551 with an estimated value of \$1,188,285.

In 1930 world attention was directed to the Canadian North by the discovery of pitchblende and silver deposits on Great Bear lake. During 1937 activity centred around the pitchblende-silver deposits on Great Bear lake and the gold discoveries on Outpost island, Yellowknife river, and Gordon lake, in the Great Slave lake area. In the Yellowknife and Gordon lake areas, one 100-ton mill has been installed and another will be erected in the spring of 1938. In Dec. 1937, a rich find of gold-bearing quartz was reported from Snare river, 40mi. north of Rae on Great Slave lake. There were at the end of 1937 nearly 4,000 claims in good standing in the North-West Territories. (H. A. G.)

**Norway**, kingdom of North-west Europe, member of the League of Nations. Bounded N. by the Arctic ocean, E. by Finland and Sweden, S. and W. by the North sea and Arctic ocean. Capital, Oslo. Ruler, King Haakon VII (born 1872; elected 1905). National flag, a blue St. George's cross, white-bordered, on a red ground.

**Area, Population and Cities.**—Area: 124,588 sq.mi.; population (1930 census): 2,814,194; (1935 estimate) 2,884,300;

County ( <i>Fylke</i> )	Area (sq.mi.)	Population (1930)
Aust-agder . . . . .	3,607	73,816
Vest-agder . . . . .	2,794	81,233
Akershus . . . . .	2,064	236,939
Bergen (town) . . . . .	14	98,303
Buskerud . . . . .	5,738	143,073
Finnmark . . . . .	18,573	53,308
Hedmark . . . . .	10,621	157,942
Hordaland . . . . .	6,043	164,376
Møre . . . . .	5,812	165,064
Nordland . . . . .	14,728	186,920
Opland . . . . .	9,608	137,710
Oslo (town) . . . . .	6	253,124
Östfold . . . . .	1,613	167,030
Rogaland . . . . .	3,546	173,258
Sogn og Fjordane . . . . .	7,135	91,808
Telemark . . . . .	5,837	127,754
Troms . . . . .	10,045	97,467
Nord-trøndelag . . . . .	8,659	96,016
Sør-trøndelag . . . . .	7,241	174,946
Vestfold . . . . .	903	134,107

Primary education is compulsory. Education figures (1933-34): 5,779 elementary schools with 392,482 pupils; 136 secondary, with 26,607; Oslo university, with 3,905. The Evangelical Lutheran Church is State-endowed, its ministers being nominated by the king; other religious bodies are tolerated (except Jesuits) their adherents totalling (1930) only 91,459 (chiefly Methodists and Baptists).

Leading towns (1930 populations): Oslo, 253,124; Bergen 98,303; Trondheim, 54,458; Stavanger, 46,780; 5 others above 15,000.

**History.**—The king represents the executive, the *Storting* (constitution for 1937-39: Labour, 70; Conservative, 36; Liberal, 23; Agricultural, 18; other parties, 3=150) the people's sovereignty; election is direct, universal, and proportional. The cabinet consists of a prime minister (1935, Johan Nygaardsvold) and 8 others.

A prosperous year resulted in a reduction of the national debt. The crown princess gave birth (February) to a son (Harald—third child).

Lars Christensen discovered (February), from the air, new Arctic territory, dropping the Norwegian flag at 38° E. long., 69° 30' S. latitude. In March, questions of neutrality and defence were discussed, and the period of annual training in the service:

NORWAY: Industrial production index, without adjustment for seasonal variation (*The Annalist*)

was extended. Oslo having been the scene of origin (1930) of the Convention bearing its name, Norway took an active interest in its projected revival. Representatives of 7 States—Norway, Sweden, Denmark, Finland, Holland, Belgium and Luxemburg—met at The Hague (March), completed their deliberations in Brussels, and signed at The Hague (May) a pact in favour of continued preferential trade relations among themselves, provisionally for a year from July 1, some of them afterwards extending the concessions to non-signatories (*see* BELGIUM; NETHERLANDS).

**Trade, Communications, and Finance.**—Less than four per cent of the land is cultivatable. Yet agriculture and forestry support nearly one-third of the population, industries closely following, aided by abundance of water-power. The wealth of pyrites and iron-ore leaves some to be exported, together with paper and pulp, electro-chemical and electro-metallurgical products. Imports: 922,947,000 kroner (£46,147,000); exports: 674,491,000 kroner (£33,725,000); both figures showed increases (1936); Great Britain takes nearly one-quarter.

Mercantile marine (1937): 4,015 ships (4,201,120 tons). Mileage of railways (mainly State): 2,464 (1935); of roads: 24,980 (1936). Telegraphs and telephones are well developed; there are 78 wireless stations. A subsidized air-service flew (1936) 210,581 miles (4,537 passengers; 148 metric tons of goods).

The unit of currency is the krone (at par 18.16 kroner=£1). The "Norges Bank" (joint-stock, but largely State-owned) had in circulation (1937) notes representing 400,702,000 kroner. In savings banks (1935) 2,249,288 depositors had 1,989,459,000 kroner.

Budget (1936-37): revenue, 549,000,000 kroner; expenditure, 491,700,000 kroner.

**Defence Forces.**—The army is a National Militia, with compulsory training (extended from March to 84 days); strength (1936), 12,300 men. The navy has 4 small cruisers, other small craft, and 36 seaplanes.

**BIBLIOGRAPHY.**—Fritz Meyen, *Norwegen* (Berlin, 1934); J. Vidnes, *La Norvège* (Oslo, 1934).

## Notre Dame, University of.

Intensification of scientific research received major attention at the University of Notre Dame during 1937. A new biology building costing \$400,000 was opened; unique among its laboratory features is a complete series of cages for the raising of germ-free animals and plants. The laboratories of physics were

extended to provide complete general equipment for graduate work, and full graduate courses in physics and mathematics are now offered. A general symposium in science was held in January, to honour the memory of the late Julius A. Nieuwland, C.S.C., professor at the University of Notre Dame and discoverer of the basic elements of synthetic rubber. A symposium in the calculus of variations, held in April, drew mathematicians from all parts of the United States. European scientists added to the faculty during the year include Arthur E. Haas and Eugene Guth, in physics; and Karl Menger and Emil Artin, in mathematics.

In the field of democracy and citizenship, the university co-operated with the Alumni Association in an anti-communism campaign. Features of this were the national speaking tour of the alumni President, Arthur J. Hughes, of Chicago, and a similar tour by Arnold Lunn, of England, visiting professor at the university; a series of local addresses by the Rt. Rev. Msgr. Fulton J. Sheen, Rev. James M. Gillis, C.S.P., and Hon. J. Edgar Hoover, and a lecture course by Waldemar Gurian, late of Russia and Germany.

During the year the university opened the renovated Corby hall as a faculty residence, erected Zahm hall (a Freshman dormitory), and began the construction of the Rockne Memorial Field House. The Laetare Medal for 1937 was conferred on Professor Jeremiah D. M. Ford, of Harvard university. The enrolment figures for 1937-38 were 3,080 with 845 part time students and a faculty of 211.

(J. F. O'H.)

**Nova Scotia,** one of the original provinces of the Dominion of Canada; area 21,428 sq.mi.; population, according to the Canadian census of 1931, 512,846, estimated Jan. 1, 1938, 537,000. Capital, Halifax, 59,275. The only other city in the Province is Sydney, 23,089, which is the centre of the coal, iron and steel industries. Of the Province's population, 281,192 are rural or 55%; 507,235 are Canadian born or 97%.

The upper house of the Provincial Legislature was recently abolished by order in council. It was held that its members held office at the will of the Government and that it was within the power of the Government to dismiss them at pleasure. In 1936 an act of the Provincial Legislature was passed establishing a Department of Labour. This act gives the Department full control over all matters relating to labour and provides for the appointment of a Minister and Deputy Minister of Labour. The latter is empowered to collect and publish information and statistics affecting labour and to administer such acts as may be assigned to the Department by the Government. At present (1938) labour bureaus in the Province, the administration of the Factories Act, Minimum Wage Board, Limitation of Hours Board, Industrial Standards and unemployment relief are under the control of the Department of Labour.

In 1937 an act was passed authorizing wage-earners to establish unions of such kind as they desired or to join such existing unions as they chose and forbidding any interference on the part of employers—an act which has much in common with the Wagner Act in the United States. This and similar acts were sponsored and passed by the Liberal Government which was again returned to office by a majority of 25 to 5 in an election held on June 29, 1937, under the leadership of the Hon. A. L. Macdonald, who is Premier, Provincial Secretary and Treasurer of the Province. The lieutenant-governor, who is appointed by the Dominion Government, is the Hon. Walter H. Covert. Nova Scotia is represented in the Dominion House of Commons by 12 members, all of whom belong to the Liberal Party, and in the Dominion Senate by 10 members who are appointed for life.

The total gross annual agricultural revenue in 1935 was \$27,042,000. The value of manufactured products for the same year

was \$161,207,522 (£32,241,000) while for 1936 the value of mineral products was \$26,569,294 (£5,314,000).

**BIBLIOGRAPHY:** *The Royal Gazette; Report of the Duncan Commission.* (J. C. HE.)

**Noxious Weeds.** Development of chemical herbicides to eradicate bindweed, Canada thistle, quack grass, downy brome grass and other weed pests reveals interesting and practical results, as reported in 1937 in the *Journal of the American Society of Agronomy*, in the *Journal of the Department of Agriculture of South Australia*, and in other scientific publications. Extensive tests of acid-arsenic poisoning of weeds at the California Agricultural Experiment Station, Davis, Calif., are reported to the Society of Agronomy by A. S. Crafts, and show various factors that determine the effectiveness of poisoning plats of bindweed. Plats 40 rods square were sprayed with one and one-half, two, three, and four gallons each of a stock arsenic solution, with commercial, concentrated sulphuric acid. Percentage of resprouting in four plats, each sprayed with four gallons of solution, was 0.5, 1.7, 3.2, and 6.5%. Heavier spraying up to six gallons produced no added results, and it is concluded that a spray of four and one-half gallons under favourable conditions will produce practical results. The solution, the report recites, may be made for as little as one cent a gallon, making the cost for materials to spray an acre about \$5 to \$7.50. It is pointed out, however, that the water balance within the sprayed weeds must be such that the weeds will absorb the spray, first in the leaves, then on into the stems and finally into the roots. While acid-arsenical weed poisoning has proved practical in semi-arid regions it is necessary that the limiting factors be realized in humid regions. It was found most practical to spray at night to avoid evaporation of the spray before the plant could absorb it, and also not to spray when humidity was low or there was a strong wind. Best results were obtained in spraying Russian knapweed (*centurea repens*): intermediate results in spraying alkali mallow (*sida hederacea*) and bindweed, and total failure in spraying perennial grasses and hoary cress.

Experiments at the Waite Research Institute in South Australia recommend spraying bindweed with sodium chlorate or mixing the chlorate with sand and applying about one and one-half ounces to the square yard. The expense of eradicating bindweed with chlorates, however, was said to be £12 to £15 per acre and a caution as to the highly inflammable nature of sodium chlorate is added.

(S. O. R.)

**Nursery Schools.** In the last decade two marked developments in American nursery schools have occurred: first, a steady increase in publicly and privately supported schools under relatively permanent auspices and, second, the establishment, as an emergency measure, of many schools under Federal support.

The 1927 U.S. Office of Education survey lists 76 nursery schools of the permanent type, while the 1936 report lists 285. The typical age range is two to five years. Half are in full-day session, and the remainder in half-day session. Fifty per cent are supported by tuition, 27% by universities, 19% by philanthropic organizations and 4% by public schools. While service for children is the primary purpose, schools also function as: research centres; demonstration centres for training teachers, home economics workers and nurses; centres for parent education and, recently, in public high schools as centres for pre-parental education. Nursery school teachers have excellent professional training; 31% have bachelor's degrees and 41% master's or doctor's degrees. With its emphasis upon growth and development and upon children's needs and activities, the nursery school is exer-

cising a marked effect upon the education of older children.

The emergency nursery school program of the Works Progress Administration is outstanding. In October 1937, 1,481 emergency schools in 48 States, the District of Columbia, and Hawaii, enrolled 40,243 children. Features of this program are: extensive in-service training of teachers who through direct contact with young children have gained insight into modern training methods; the close integration of health and nutrition services with educational services; several experiments in adapting nursery school techniques to young children of varied racial origins and to children with physical handicaps, and a very effective program of parent education.

In its close integration with modern research, the nursery school movement differs from earlier educational movements. As a result both its standards and its practical achievements are at a very high level.

(J. E. A.)

**Great Britain.**—During 1937, considerable progress was made in the establishment of nursery schools. In England and Wales, as against 85 schools recognized by the Board of Education in 1936, accommodating 6,335 children, there are now 96, with accommodation for 7,066. Of these, 37 are maintained by local education authorities and 59 by the State and voluntary organizations jointly. Proposals for another 40 new nursery schools are under consideration. In Scotland, there are now 22 nursery schools, of which 17 are voluntary and 5 under local education authorities. Belfast has 2 voluntary nursery schools.

**Soviet Russia.**—In the U.S.S.R., in 1937, 2,500,000 children under eight were in properly equipped full-time nursery schools with qualified staff, including doctor and nurse, and visiting or full-time psychologist. Another 3,500,000 are cared for in a more primitive kind of nursery school, as a temporary measure, which contains children of mixed ages in one or two groups, under the care of untrained or short-term (eight weeks to six months) teachers. Decrees have been issued requiring the various bodies who organize nursery schools to increase their number.

(S. E. D.; G. Ow.)

**Nutmegs:** see SPICES.

**Nuts.** Yield of the four principal nut trees, filbert, almond, English (Persian) walnut, and cultivated pecan, was 226,000,000lbs., 41% more than the average annual production in the United States. The huge increase is owing mainly to the larger increase in walnut orchards and also to filberts which are just entering the beginning stage of rapid increase. The United States Department of Agriculture believes that unless there is an unforeseen abandonment of orchards or pulling of trees, combined nut crops of 200,000,000lbs. will become typical. A further indication of the increase in nut farming in the United States is shown by the import figures. In 1929 English walnut importations were 23,537,000lbs.; in 1936 they were 4,535,000 pounds. Filbert importations were 21,495,000 in 1929 and 10,038,000 in 1936; almonds, 19,997,000lbs. in 1929 and 12,668,000lbs. in 1936. Large pecans formerly sold at 10 to 50 times the price of forest pecans; now at two to five times, largely because the shelled pecan market prefers smaller nuts. Efforts are being made by the Department of Agriculture to develop a blight-resisting chestnut and restore the chestnut groves.

The seven walnut-growing countries of Europe produced in 1937 a crop estimated at 2,147,000 bags of 110lbs. each, which is 21% larger than the 1936 production of 1,770,000 bags, and 37% larger than the 1929-33 average of 1,571,000 bags. In recent years only the 1931 crop of slightly more than 200,000,000lbs. has approached the 1937 yield. Production by countries in 1937 and 1936 was: France, 810,000 in 1937 and 740,000 bags

1936. Italy, 400,000 and 255,000 bags. Rumania, 300,000 and 20,000 bags. Yugoslavia, 175,000 and 240,000 bags. Turkey, 50,000 and 200,000 bags. Bulgaria, 90,000 and 117,000 bags. Hungary, 60,000 bags in each of both crop years.

The three principal filbert-producing countries, which are Italy, Spain and Turkey, had an estimated 1937 crop of 135,000 short tons of filberts compared with a 1936 production of 131,000 tons and a six-year (1929-34) average of 91,800 tons.

Exports of walnuts from North China have greatly diminished, chiefly because of the large crops in the United States and Europe, although difficulties and extra charges for trans-shipment at Chinese ports have also had a retarding effect. The 1937 exports are estimated at about 200,000 cases of 55lbs. each.

(S. O. R.)

## Nyasaland Protectorate, The.

This British protectorate in East Africa is nowhere more than 100 mi. in width. The governor is Sir H. B. Kittermaster, K.C.M.G., K.B.E. Zomba is the capital, and Blantyre the commercial centre.

Area c. 37,000 sq.mi.; pop. 1,622,926, of whom 1,838 are Europeans and 1,558 Asiatics. Excepting a Government Jeanes training centre, all education is managed by missions. There are no secondary schools, but four elementary schools for Europeans.

Exports of fibre, soya beans, tea, and tobacco increased in 1936, beans figuring for the first time as an appreciable export. Coffee exports fell from 366cwt. in 1934 to 168cwt. in 1936. Total exports in 1936 were valued at £817,669, and imports at £794,089. Communication with Beira in Portuguese East Africa is effected by Nyasaland railways and the Central African railway, 89 mi. of which lie in the territory and 24 in Portuguese territory, and by the Trans-Zambesi railway which is wholly in Portuguese territory.

English silver and copper coins are legal tender. Income tax yields £131,608. Revenue for 1936 was £798,426 and expenditure £754,217. It was decided during the year that the tobacco crop of about 15,000,000lbs. annually should in future be sold compulsorily by auction instead of by private treaty.

There is a Nyasaland Volunteer Reserve.

**London Conference:** see MEDITERRANEAN, THE; NON-INTERVENTION COMMITTEE.

Excluding Russia, for which no data are available, the world production of oats in 1937 was estimated by the International Institute of Agriculture as 2,957,783,000bu. compared to 2,572,776,000bu. in 1936. There was little change in Europe, 1,475,399,000bu. in 1937 and 1,465,207,000 in 1936. The estimates for Canada were 299,694,000bu. in 1937 and in 1936 288,764,000 bushels. Production in the United States in 1937 was estimated by the Department of Agriculture as 46 per cent larger than the previous year, or 1,146,258,000bu. from 35,079,000ac. harvested in 1937, as against 785,506,000bu. from 33,000,000ac. in 1936. The 1937 crop, however, was 6 per cent smaller than the five-year (1928-32) average of 1,215,102,000bu. from an average annual acreage of 40,015,000,000. The average yield per acre in the United States in 1937 was 32.7bu., compared with 23.5bu. in 1936 and 30.2bu. for the ten-year average (1923-32). Yields were generally above average, except in the north-east, the Northern Great Plains and Oklahoma and Texas. The estimates by the International Institute of Agriculture for wheat production for Germany at 404,304,000bu. in 1937 and 370,074,000bu. in 1936; for France, 313,989,000 in 1937 and 300,354,000bu. in 1936. Poland's crop was 161,901,000 in 1937 and 181,887,000bu. in 1936; that of England and Wales, 63,280,-

000 in 1937 and 75,600,000bu. in 1936; Scotland, in 1937, 47,600,000bu. as against 44,940,000 in 1936. The crop in Czechoslovakia in 1937 was 88,824,000bu.; in 1935 it was 83,938,000bu.; in Sweden, 86,476,000 and 85,291,000bu.; in Argentina, 54,564,000 and 59,566,000 bushels. (See also CEREALS.) (S. O. R.)

**Obituaries.** Biographies of the following men and women who died during 1937 will be found in their regular alphabetical order in this Year Book.

Name	Birth Date	Death Date
ABDULHALIK HAMID, Turkish poet . . . .	1852	Apr. 13, 1937
ADLER, ALFRED, Austrian psychologist . .	Feb. 7, 1870	May 28, 1937
ALDRICH, RICHARD, American music critic	July 31, 1863	June 2, 1937
AMES, WINTHROP, American theatrical producer	Nov. 25, 1871	Nov. 3, 1937
ARMSTRONG, HENRY EDWARD, British chemist	May 6, 1848	July 13, 1937
ASHTON, ALGERNON BENNET LANGTON, British composer	Dec. 9, 1859	April 10, 1937
BAKER, GEORGE FISHER, American financier	Mar. 19, 1878	May 30, 1937
BAKER, NEWTON DIEHL, U.S. secretary of war during the World War . . . .	Dec. 3, 1871	Dec. 25, 1937
BAQIR SIDQI PASHA, Iraq statesman . . .	1890	Aug. 12, 1937
BARBOUR, CLARENCE AUGUSTUS, American clergyman	Apr. 21, 1867	Jan. 16, 1937
BARRIE, SIR JAMES MATTHEW, Scottish playwright	May 9, 1860	June 19, 1937
BAYLIS, LILLIAN MARY, British producer of low-priced Shakespeare . . . .	May 9, 1874	Nov. 25, 1937
BINGHAM, ROBERT WORTH, U.S. ambassador to Great Britain . . . .	Nov. 8, 1871	Dec. 18, 1937
BISLETT, GAETANO, Catholic cardinal . . .	Mar. 20, 1856	Aug. 30, 1937
BLAKE, JOSEPH AUGUSTUS, American surgeon	Aug. 31, 1864	Aug. 12, 1937
BORDEN, SIR ROBERT LAIRD, Canadian statesman	June 26, 1854	June 10, 1937
BOSE, SIR JAGADIS CHANDRA, Indian physicist	Nov. 30, 1858	Nov. 23, 1937
BOTHMER, FELIX VON, Count, German Army officer	Dec. 10, 1852	Mar. 19, 1937
BURLESON, ALBERT SIDNEY, postmaster general under President Wilson . . .	June 7, 1863	Nov. 24, 1937
BUTLER, ELLIS PARKER, American humourist	Dec. 5, 1869	Sept. 13, 1937
CARTER, MRS. LESLIE, American actress .	June 10, 1862	Nov. 13, 1937
CHAMBERLAIN, SIR (JOSEPH) AUSTEN, British statesman . . . .	Oct. 16, 1863	Mar. 16, 1937
COBURN, IVAH WILLS, American actress .	Sept. 6, 1873	April 27, 1937
COFFIN, HOWARD EARLE, American industrialist . . . .	Apr. 12, 1856	Nov. 21, 1937
CONWAY, WILLIAM MARTIN CONWAY, 1st Baron, British art critic . . . .	Jan. 1, 1863	Apr. 19, 1937
COUBERTIN, PIERRE DE FREDI DE, Baron, French author and originator of the modern Olympic games . . . .	Jan. 1, 1863	Sept. 2, 1937
COX, SIR PERCY ZACHARIAH, British administrator . . . .	Nov. 20, 1864	Feb. 20, 1937
CRANE, (ROBERT) BRUCE, American landscape artist . . . .	Oct. 17, 1857	Oct. 30, 1937
CROISSET, FRANCIS DE, French playwright and author . . . .	Jan. 28, 1885	Nov. 8, 1937
CROZIER, FRANK PERCY, British general and pacifist . . . .	Jan. 9, 1870	Aug. 31, 1937
DALEN, GUSTAF, Swedish inventor . . . .	Nov. 30, 1869	Dec. 9, 1937
DALZIEL, JOHN SANDERSON, American wood engraver . . . .	Dec. 24, 1839	Aug. 18, 1937
DAMROSCH, FRANK HEINO, American musician and founder of the Institute of Musical Art . . . .	June 22, 1859	Oct. 22, 1937
DAVIDSOHN, ROBERT, German historian . .	Apr. 26, 1853	Sept. 18, 1937
DERNBURG, BERNHARD, German official and war propagandist . . . .	July 17, 1865	Oct. 15, 1937
DOUMERGUE, GASTON, French statesman .	Aug. 1, 1863	June 18, 1937
DRINKWATER, JOHN, British poet and playwright . . . .	June 1, 1882	Mar. 25, 1937
EAMES, WILBERFORCE, American bibliographer . . . .	Oct. 12, 1855	Dec. 6, 1937
EARHART, AMELIA, American aviatrix . .	July 24, 1898	July 2, 1937
EDWARDS, ALFRED GEORGE, Welsh churchman and archbishop . . . .	Nov. 2, 1848	July 22, 1937

WISE, THOMAS JAMES, British bibliographer of English authors	Oct. 7, 1859	May 13, 1937
ZACHRISSON, ROBERT EUGEN, Swedish professor of English	Jan. 15, 1880	July, 1937

**Ocean Liners:** see SHIPBUILDING; SHIPPING, MERCHANT MARINE: *Passenger Business*.

**Oceanography.** Being a comparatively young science, at least on its geophysical side, oceanography is still largely in the descriptive stage. Observations are difficult and expensive to get, and progress is consequently slow, though helped by parallelism, when it exists, with certain problems in meteorology.

General interest is centred chiefly on the identification of oceanic water masses and their movements. This year the "Discovery II" (Great Britain) completed her fourth commission in the Southern ocean. The "Meteor" (Germany) has begun her survey of the north Atlantic with a four months' cruise off Cape Verde. Since her survey of the south Atlantic in 1925-27, she has made four cruises in the Denmark strait region. The reports are published of the "Marion" and "General Greene" (United States) expeditions (between 1928 and 1935) to the Labrador sea, and of the "Atlantis" (United States) expeditions in 1933 and 1934 to the Caribbean and Cayman seas. The work of the latter ship in the north-western north Atlantic was reported last year (*Papers Phys. Oceanogr. Meteorol.*, Woods Hole Oceanogr. Inst., IV, 4, 1936). Most of the countries bordering the north-eastern north Atlantic (countries belonging to the International Council for the Exploration of the Sea) contribute data for waters between Portugal and Greenland, and the U.S.S.R. have worked in the Kara sea. Hydrological observations are made from their station on the ice, which has drifted rather rapidly from the Pole roughly along the meridian of Greenwich. Regular observations are made by Japan in the adjacent seas, which have helped to furnish data for comparison of the Kuroshio and the Gulf Stream. The latter is evidently a much more important feature of the Atlantic than the former is of the Pacific.

The most important result of recent studies is the recognition of certain broad features common to the three great oceans. The hydrosphere is divided into two primary regions, termed (borrowing from meteorology) the troposphere and stratosphere; they are separated by a thermocline in the depths (500-1,000 metres) and the polar convergences ("fronts") in roughly 50° latitude, and the stratosphere lying beneath, and polarwards of the troposphere. The circulations in these regions are distinct, the exchange taking place through the boundaries being small. The position of the antarctic convergence has been mapped, and appears to change little. It has also been found that, while the relative position of the water masses is similar all round the Antarctic continent, the bulk of the bottom water is formed in the Weddell sea, whence it moves eastwards and northwards.

The dynamical methods, based on Bjerknes's theorem, used for calculating current-speeds, appear inadequate sometimes to account for all the motion, possibly when there are strong vertical components. These methods have the general limitation, too, that to get absolute velocities, reference surfaces in which the motion is known—or nil—are required. The selection of suitable datum

surfaces is one of the chief difficulties.

Experimental studies are being made of the dynamics of ocean currents, mainly in relation to diffusion processes, internal waves, adjustment of velocity to pressure gradients, etc. In narrower waters, considerable success has been attained in distinguishing water masses by their plankton, and by their content in various salts. It has been observed that in recent years, concurrently with an increase in atmospheric circulation, there has been a considerable extension of the influence of the Gulf Stream towards the Pole. Not only in the Arctic has the water temperature increased but the effect is felt even in the English Channel, the rise being about 0.5° C. On the chemical side, the greatest achievement has been the work on the calcium carbonate equilibrium. (J. R. L.)

**Officers Reserve Corps:** see ARMIES OF THE WORLD: *Military Service*.

**Ogden, Rollo** (1856-1937), American journalist, editor of *The New York Times* (1922-37) and of *The New York Evening Post* (1903-20). He was born at Sand Lake, N.Y., Jan. 19, 1856, and graduated from Williams college in 1877. After attending the Union Theological seminary, he was ordained to the Presbyterian ministry in 1881. His journalistic career began in 1891 when he became a member of the editorial staff of *The Post*, his attacks on Tammany Hall aiding the election of reform officials in 1894 and 1901. As editor, he advocated civil service reform, woman suffrage, industrial legislation and co-operation for world peace. This work was continued on *The Times*, of which he was still editor at his death in New York city on Feb. 22, 1937.

**O. Henry Memorial Awards:** see LITERARY PRIZES: *United States*.

**Ohio**, north central State of the United States, popularly known as the "Buckeye State"; area, 41,040 sq.mi.; population (1930 census), 6,646,697, estimated July 1, 1937, 6,733,000. Capital, Columbus, with a population of 290,564 (1930). Other cities with over 100,000 were: Cleveland, 900,429; Cincinnati, 451,160; Toledo, 290,718; Akron, 255,040; Dayton, 200,982; Youngstown, 170,002; and Canton, 104,906. Of the State's population, 4,507,371 were urban, or 67.8%; native white 5,686,985; foreign born 644,151; and coloured, 309,304.

**History.**—Ohio's flood disasters in 1937 were the greatest in its history. First warnings of unusual high water in the Ohio river were received Jan. 14. Four days later, all river cities from Steubenville to Cincinnati were inundated. On Jan. 21, it was estimated 80,000 Ohioans were homeless. That day a flood stage of 72.3ft. was recorded at Cincinnati. Gas had been shut off in most of the cities and electric power plants were closing. On Jan. 22, the estimated number of flood refugees in Ohio had risen to 140,000 and the State began to raise a rescue army. One day later the American Red Cross took over the relief work. Thousands were in need at many cities, especially at Portsmouth where both a famine and a shortage of drinking water were faced. On Jan. 24, the Ohio river at Cincinnati had risen to 77.4ft. and a fire had broken out there which caused a loss of more than \$1,000,000. There were reports of looting at Portsmouth. The next day it was estimated that 550,000 were then homeless. City Manager C. A. Dykstra was given complete control of flood activities in Cincinnati and Gov. Martin L. Davey of Ohio signed an emergency act passed by the State assembly allotting \$250,000 to flood relief. On Jan. 28, the river reached a flood stage of 79.99ft. at Cincinnati, the highest in history. By that time, the Red Cross

estimated, 750,000 had been rendered homeless in Ohio. Fourteen lives had been lost. Flood water receded rapidly after Jan. 27 but the work of rebuilding continued for months.

A year of strikes in Ohio began Jan. 16 when 300 members of the Gas Employees Union walked out at Toledo. Seventy thousand customers of the Toledo gas company were affected. This strike

was followed on Jan. 26 with one at the Toledo plant of the Libbey-Owens-Ford Glass Company. The glass workers strike was settled within four days by wage increases of eight cents an hour. After there had been minor labour troubles in April at Akron rubber plants, strikes broke out in the neighbouring cities of Canton and Massillon on May 26. Four steel mills were affected in Canton, the Stark, the Berger Manufacturing Co., the Alloy Steel Division and the Canton Tin Plate. One was affected in Massillon, the plant of the Republic Steel Corporation. These strikes immediately spread to Cleveland, Youngstown and Warren. On June 9, there were riots at the Republic Steel's Bessemer plant in Youngstown. These were followed, June 18, by riots at the steel plants in Canton. The next day, rioting was resumed in Youngstown and one man was killed and fourteen injured. On June 21, Gov. Davey ordered several companies of the Ohio National Guard to Youngstown and Warren. Within two days, the troops had restored order and on June 25 the Youngstown mills had begun to reopen. Disorders continued in Canton, culminating in another riot there, July 1. Troops were sent in. Four days later, the national guardsmen were moved from Canton and Warren to Cleveland when there was rioting at the steel mills. This series of riots was ended with the one at Massillon on July 11 when one person was killed and six others were shot. (Guardsmen were sent to Massillon. A few days later, the steel mills in all the Ohio cities affected by the strikes were preparing to reopen.)

The general assembly of the State convened at Columbus, Jan. 2. Keith Lawrence of Cleveland was elected floor leader of the Senate. Proposed unemployment relief legislation was debated throughout January but the legislature recessed Jan. 27 without having taken any action to provide funds to the various cities which were demanding State aid. Upon reconvening, the Senate passed a bill to provide \$4,000,000. On April 5, Gov. Davey ordered that the Ohio National Guard prepare to take over relief duties throughout the State. This action resulted in protests from many cities and the order was rescinded after a large delegation of objectors had stormed the governor's office in the State capitol on April 9, had been clubbed by police and evicted. On April 15, all State relief to cities stopped. Several municipalities put special relief tax levies up to a vote of their people but in nearly every case the levies failed because the legislature had stipulated that all such measures must be carried by a majority of 65% of those voting. Efforts were made to have the Assembly reduce this majority to 55% but the lower house on Dec. 21 defeated a bill which would have accomplished that purpose.

On Dec. 20, by a vote of 21 to 5, the Senate adopted a resolution creating a committee with almost unlimited powers to investigate all departments of the State government. Former Senator James Metzenbaum of Cleveland was chosen as special

MARTIN L. DAVEY, governor of Ohio

counsel for the committee and the investigation began Dec. 21.

**Agriculture, Manufactures, Mineral Production.**—In 1935 Ohio had 255,146 farms covering 22,857,692 ac. with crops valued at \$96,151,000, and livestock items worth \$195,903,000. Manufactures during the same year were valued at \$3,685,441,642 with steel products (\$478,606,677), rubber tires (\$299,321,191), motor vehicles and parts (\$272,793,381), electrical machinery (\$161,267,421), and meat-packing (\$109,891,813). Of the mineral output of \$126,133,670, coal and clay products led with a value of slightly over \$35,000,000 each. Pig-iron production, including out-of-State materials was set at \$93,530,895. (P. By.)

**Ohio River:** *see* MISSISSIPPI RIVER SYSTEM.

**Ohio State University.** Formally established as a land-grant institution in 1870, the Ohio State university opened its doors on Sept. 17, 1873, to a student body of 17. In the autumn quarter of 1937 the full-time, resident enrolment reached a record figure of 12,827. The annual enrolment, including summer quarter, is 16,670. Centrally located in Columbus, the capitol city of Ohio, the university draws its student body from all 88 counties, as well as from other States and nations. It has a teaching staff of 1280.

During 1937 a new building has been erected for the school of social administration and an addition provided at University hospital to house out-patient and isolation departments of the college of medicine. Additional dormitory space has been provided under the stadium, enabling the university to house a total of 400 men in its co-operative dormitories at \$125 per year for room and board.

An exploratory program has been provided in the college of arts and sciences for students undecided on their college programs. The year has seen an expansion of the Ohio State University Research Foundation, to make campus facilities and personnel of greater use to industry, and the creation of a new Ohio State University Development Fund, to secure gifts from alumni and others for university purposes.

The university, which is co-educational, includes colleges of agriculture, arts and sciences, commerce and administration, dentistry, education, engineering, law, medicine, pharmacy, and veterinary medicine, a graduate school, and special schools of home economics, journalism, nursing, optometry, and social administration. Its plant consists of 80 buildings and 1200 ac., of which 300 are in campus and 900 in farm.

**Oklahoma,** the forty-sixth State of the United States, and popularly known as the "Sooner State," has a total area of 70,057 square miles. The population in 1930 was 2,396,000 (estimated July 1, 1937, as 2,548,000). The capital and largest city is Oklahoma City, population 185,389 (estimated, 1938, 215,000); the second largest city is Tulsa, 141,258 (estimated 160,000). Of the State's population, 821,681 were urban, or 31%; 2,095,671 were native white; 26,753, foreign-born white; 172,198, coloured; and 92,725, Indian.

**History.**—Oklahoma was admitted to the Union, Nov. 16, 1907, formed by the combination of two territories, Oklahoma Territory and Indian Territory. The constitution as adopted provided for an executive branch, to consist of the governor and twelve other elective officials; a legislative branch consisting of a senate of 44 members and a house of representatives limited to

109 members to meet biennially; and a judicial branch to consist of a supreme court, a criminal court of appeals, and certain subordinate courts. The governor is Ernest W. Marland, elected in 1934 to serve for a term of four years. The next gubernatorial election is in 1938 (primary, July; general election, November), the incumbent being constitutionally ineligible to re-election. By action of the Sixteenth Legislature (1937) the run-off primary was abolished and the candidate receiving a plurality in the party primary advances to the general election. In the Federal election of 1936, Oklahoma cast 501,069 for Roosevelt and 245,122 for Landon.

ERNEST WHITWORTH MARLAND, governor of Oklahoma

**Education.**—The educational institutions include the University of Oklahoma, at Norman (enrolment in residence, 7,237); Oklahoma Agricultural and Mechanical College, Stillwater (1937-38 enrolment, 5,520); Oklahoma College for Women, Chickasha; Colored Agricultural and Normal University, Langston; six State teachers' colleges; four secondary agricultural schools; four junior colleges; and six independent senior colleges.

There are 16 municipal junior colleges and 838 high schools. The total elementary and high-school district enrolment in 1936 was 658,969.

**Charities and Corrections.**—The hospital and eleemosynary institutions include five mental hospitals, three tubercular sanitariums, two orphans' homes, school for the deaf, and school for the blind. The penal and corrective institutions include a penitentiary and its sub-penitentiary, a reformatory, and four schools of detention and correction.

**Banking and Finance.**—Of the 77 counties, 69 are in the Tenth (Kansas City) Federal Reserve District and eight in the Eleventh (Dallas) District. There are 185 banks under State supervision. In 1936, 387 banks carried Federal Deposit Insurance and 18 did not. Bank deposits stood at \$416,127,000 on June 30, 1936, with total resources amounting to \$467,131,000. State expenditures for 1937-38 were estimated at \$99,013,862. There is at present no property tax, the main sources of revenue being a gasoline tax, a sales tax, a production tax, and an income tax. The State debt stood at \$10,504,000 in July 1937.

**Agriculture, Manufactures, Mineral Production.**—The chief agricultural commodities are wheat, cotton, corn, and grain sorghums. The total value of agricultural products in 1936 was \$94,000,000 (estimated 1937, \$155,000,000). The wheat and cotton production for 1937 is estimated at \$92,000,000 as against a production of \$46,000,000 in 1936. The principal mineral products are petroleum, lead, zinc, and coal. There is a known reserve of 3,500,000,000 bbls. of petroleum and in 1937 there was a pipeline run of 607,702 bbls. daily.

In 1937, there were produced 1,327,741 tons of coal and 252,133 tons of lead and zinc. The chief manufacturing interests are glass, cement, flour, brooms, gasoline, and all types of refinery products. The total value of manufactured products in 1935 was \$282,658,470. (R. Gtr.)

**Olaya Herrera, Enrique** (1881-1937), Colombian statesman, served as president from 1930-34. At the time of his death in Rome, Feb. 18, 1937, he

was Minister to the Vatican. He was born at Guateque on Nov. 12, 1881. Following graduation from the University of Bogota in 1904, he entered journalism, founding in succession *El Patriota*, *Gaceta Republicana*, and *Diario Nacional*. He made his political debut in 1910 as a member of the National Assembly. After serving as Minister of Foreign Affairs, he became Minister to Chile in 1912 and to Argentina in 1913. During 1917-18 he was a member and vice president of the Chamber of Deputies and during 1920-21 senator from the Department of Tolima. While again serving as Minister of Foreign Affairs in 1921, he induced the Colombian Congress to ratify the \$25,000,000 treaty which settled the difficulties between Colombia and the United States over the Panama Canal which had been pending since 1903. As Minister to the United States (1922-28), he took an active part in promoting better understanding between the two Americas. Elected in 1930 the first Liberal president in 45 years, he won such confidence that Colombia was one of the few South American countries to escape revolution during the depression period. To meet the emergency, Congress conferred on him powers amounting virtually to a financial dictatorship.

**Oman:** see ARABIA.

**Ontario,** one of the original provinces of the Dominion of Canada; area, 412,582 sq.mi.; population according to the Dominion census of 1931, 3,431,683, estimated Jan. 1, 1938, 3,690,000. Capital, Toronto, 631,207. Of the Province's population 2,095,992 are urban, or 61%; 2,794,631 native born or 81%.

The Industrial Standards Act of Ontario provides that the Minister of Labour, upon petition of representatives of the employers or employees in any industry, may convene a conference or series of conferences of employers and employees in that industry, in any zone or zones, to investigate the conditions of labour in such industry and to negotiate standard hours of labour and rates of pay. If the Minister is satisfied that an agreement in writing has been reached, he may approve it and such agreement shall be in force "during pleasure" or for a period not exceeding one year. Such agreement may also be made binding upon the industry throughout the Province. The Minimum Wage Board has authority to enforce the provisions of the act.

Much attention has been directed to the policy of the Government of Ontario in supplying cheap light and power to the people of the Province through the publicly owned and controlled Hydro-Electric Power Commission. The Commission provides electric services to over 700 municipalities, comprising nearly all of the cities and towns in the Province as well as many small communities and local areas. The actual distribution within a municipality is performed by the municipality itself, under the supervision of the Commission. The capital of the Commission and Municipal Utilities amounts to \$408,100,000 (£81,620,000); reserves \$148,474,209 (£29,680,000). Rates are low and the service is excellent. The net value of the total production of the Province in 1934 was \$1,025,262,177 (£205,052,000), an increase of 25% over the preceding year. The gross annual agricultural revenue in 1935 was \$313,077,000 (£62,613,000); of mineral products for 1936, \$184,543,853 (£36,908,000).

The provincial election of 1937 resulted in the return to power of the Liberal Party under the leadership of the Hon. Mitchell Hepburn. The party standing of the Provincial Legislature comprises 63 Liberals, 23 Conservatives and 4 Independents. The lieutenant-governor is the Hon. Albert Matthews. Ontario is represented in the Dominion Parliament by 24 senators, appointed

for life and 82 members of the House of Commons, elected for a term of five years or less.

**Opera:** see MUSIC.

**Orange Free State:** see SOUTH AFRICA, UNION OF.

**Oranges.** All records for imports of summer oranges (May to November, 1937) were broken by the United Kingdom, which in that time received 6,037,000 boxes of oranges. This compares with 4,842,000 boxes in the same period of 1936. The bulk of the shipments were from South Africa, 3,377,000 boxes, and from Brazil, 2,545,000 boxes. Only 22,000 boxes came from the United States which in 1936 shipped 612,000 boxes to the United Kingdom and 1,505,000 in 1935. The huge decrease in United States' shipments is accounted for, partly, by the freeze that damaged the California crop. Oranges, however, are one of the many agricultural products on which Britain grants preference duties to empire countries, as against other countries. The South African exports of oranges to the United Kingdom in 1936 were 2,143,000 boxes. Of Britain's 1937 imports 67,000 boxes were from Rhodesia. Other countries shipped 48,000 boxes.

The total production of oranges in the United States in 1937 was 67,067,000 boxes, the United States Department of Agriculture estimates. This compares with 55,174,000 boxes in 1936 and an annual average of 48,930,000 boxes for the five-year period of 1928-32. These figures are for the seven orange-growing States of California, Florida, Texas, Arizona, Louisiana, Alabama and Mississippi. Production by states for 1937 was as follows, with figures in parentheses being for 1936: California, 40,461,000 boxes (30,063,000). The 1928-32 annual average was 33,022,000 boxes. Of the 1937 California crop 17,422,000 boxes were Valencias, for which the five-year average crop is 25,536,000 boxes, and 16,829,000 boxes in 1936. Navels and other varieties produced 15,600,000 boxes (13,234,000) and a five-year average of 14,925,000 boxes. In Florida, the total orange production in 1937 was 24,000,000 boxes (22,500,000) and a five-year average of 15,105,000 boxes. Early and midseason varieties produced 12,800,000 boxes in 1937 and 12,000,000 in 1936. Valencias were 8,700,000 boxes (7,500,000), and tangerines 2,500,000 boxes (3,000,000).

Production in the other five States was: Texas, 1,900,000 boxes (2,000,000) and an annual 1928-32 average of 294,000 boxes. Arizona, 323,000 boxes (220,000) and an average of 133,000. Louisiana, 238,000 boxes (309,000) and an average of 243,000 boxes. Alabama, 78,000 boxes (56,000) and a five-year annual average of 100,000 boxes. Mississippi, 67,000 boxes (26,000) and 41,000 average. (S. O. R.)

**Orchids:** see HORTICULTURE: *Orchids*.

## Ordjonikidze, Gregory Konstantinovich

(1886-1937), Soviet politician, was a Georgian by birth and joined the Bolshevik party when only 17. Arrested and exiled to Siberia four years later, he escaped to Paris. Re-arrested after his return to Russia about 1912, he was exiled to the Yakutsk region of north-eastern Siberia. There he met Stalin and exhibited qualities that were to make him a Soviet leader. On the outbreak of the February revolution of 1917, he was released under the amnesty granted all political prisoners. After the Bolsheviks came into power, he served as special commissar for the Ukraine and for a time was president of the Caucasus Revolutionary

Committee. When Stalin assumed the leadership of the Communist party after Lenin's death, he became a member of the Political Bureau of the Central Executive Committee. One of the principal organizers of the first Five-Year Plan, he served as chairman of the Supreme Economic Council and later as Commissar for Heavy Industries. His death occurred in Moscow on Feb. 18, 1937.

**Oregon,** the middle of the three Pacific coast States, popularly known as the "Beaver State," and the thirty-third State admitted to the United States; area 95,607 sq.mi.; population according to the U.S. census of 1930, 953,786, estimated July 1, 1936, 1,017,000. Capital, Salem, 26,266. The only larger city is Portland, 301,815. Of the State's land area of 61,188,480 ac., 17,357,549 ac. are in farms, 19,278,160 in timber lands, 16,000,000 in public domain. The native white population is 831,554 or 87.2%; Negroes, 2,234; other races, 14,523. Urban population, 489,746, or 51.3%; rural-farm, 221,545; rural non-farm, 242,495.

**History.**—Oregon gave Mr. Roosevelt a large majority in 1936 as in 1932. The normally Republican State legislature was in Democratic hands in 1937. The legislature concerned itself primarily with stricter hunting and fishing laws; with forwarding the State building program; with attempting to meet the requirements of the Roosevelt social security program. Toward the close of 1937, the new State capitol building, to replace the old one destroyed by fire, was well along; plans were progressing for the new State library and office building, authorized by the 1937 legislature. The State was in a favourable position, except that the jurisdictional difficulties of the American Federation of Labor and the Committee for Industrial Organization had closed many logging camps and lumber mills and some industries.

The State's chief officers were Governor Charles H. Martin, Secretary of State Earl Snell, Treasurer Rufus C. Holman, Attorney-General I. H. Van Winkle, Superintendent of Public Instruction Rex Putnam, and Chief Justice Henry J. Bean.

**Education.**—During the year, Charles A. Howard resigned as State superintendent of public instruction to become president of the Eastern Oregon State Normal school and was succeeded by Rex Putnam. President Clarence Boyer also resigned as president of the University of Oregon. The school census gave 259,610 children of school age, 4 to 20; school enrolment, 1935-36, 203,162 (grades 144,356; high schools 58,806); expenditures, 1935-36, \$22,074,876; average teacher's salary—grades, \$880.62; high schools, \$1,309.78. **Charities.**—From Jan. 1, 1936, to Sept. 30, 1937, the State paid out \$8,111,438 toward general relief, including care of the poor, old-age assistance, blind assistance and aid to dependent children.

**Banking and Finance.**—On Dec. 31, 1936, 94 reporting banks had resources of \$333,507,128.44; liabilities, \$307,036,086.11; total capital, surplus, undivided profits and reserves, \$25,846,959.03. Fifty-five banks with resources of \$46,645,748.53 were State banks; 39 with resources of \$286,861,379.91 were national. The State's bonded indebtedness was reduced from \$66,062,810 on January 1, 1928, to \$46,585,010 on Oct. 1, 1937. The Treas-

CHARLES HENRY MARTIN, governor of Oregon

ury reports: cash balance, July 1, 1936, \$10,811,600.20; total receipts during year, \$61,374,667.98; total disbursements, \$60,909,605.53; cash balance June 30, 1937, \$11,276,662.65.

**Agriculture and Manufactures.**—In Sept. 1937, the U.S. Department of Agriculture estimated the principal crops for 1937 as follows: winter wheat, 13,200,000bu.; spring wheat, 7,140,000bu.; oats, 11,492,000bu.; barley, 4,221,000bu.; hops, 23,400,000lb.; potatoes, 7,840,000bu.; hay, 1,792,000 tons; apples, 3,630,000bu.; pears, 3,570,000bu.; prunes, 53,000 tons. Total value of live stock on the farms of the State was estimated at \$69,758,000 in 1937, compared to \$61,693,000 in 1936 and \$46,841,000 in 1935.

The U.S. Census of Manufactures, 1935, shows the number of establishments falling from 2,450 in 1929 to 1,358 in 1933, then climbing to 1,722. In the same years the number of wage-earners fell from 65,390 to 41,052, then increased to 52,216. In 1935 the State's manufactured products had a value of \$265,437,426 and \$53,070,000 was paid out in wages. The most important industries were lumber and timber, \$72,783,275; flour and grain, \$22,998,368; canned fruit and vegetables, \$17,651,421; meat-packing, \$13,010,125; paper, \$12,361,310. (P. R. K.)

**Oslo Convention:** see TRADE AGREEMENTS: *British Empire, Europe and Asia.*

**Ottawa,** the capital of the Dominion of Canada, is situated on the Ottawa river in the Province of Ontario. Directly across the river is the city of Hull in the Province of Quebec. The population of Ottawa is 126,872; of the metropolitan district of Ottawa 175,988.

It will be noted that Ottawa, although the capital of Canada, is not situated in a Federal District, but is wholly self-governing, subject, of course, to the condition that it obtains its charter from Ontario, of which it is an integral part. There is a growing feeling at the present time (1938) that Ottawa and its environment should be under Federal jurisdiction. This point of view is supported by the fact that a very considerable part of the real property in the city is owned by the National Government, and also by the fact that the National Government has spent large sums of money in beautifying the city by establishing and maintaining parks and driveways. Ottawa is an important manufacturing centre of wood and its products. The gross value of manufactured products in 1937 was \$25,406,000 (£5,081,000). The gross postal revenue in 1937 was \$1,026,500 (£205,300). Its most important educational institution is the Université d'Ottawa.

**Outdoor Advertising:** see ADVERTISING: *Outdoor Advertising.*

**Outer Mongolia:** see MONGOLIA.

**Oxford Groups,** or First Century Christian Fellowship, a religious movement founded in 1921 by Dr. Frank N. D. Buchman, a Lutheran minister (born Pennsylvania, June 4, 1878). The Groups, as inaugurated, have had no defined membership or organization. Anywhere and at any time, persons inside or outside the churches may meet as "a group," with the utmost freedom of opinion and association. Such groups are to be found in many countries. According to the belief and practice of the Groups, the life of the individual may be "changed" and brought under "God Control," interpreted as adjustment to circumstances, guidance in decisions, a deepening sense of obligation to others and the "sharing" of experience. The public meetings of the Groups are devoted largely to such

testimony. Within the Groups, it is the aim to promote co-operation in the social as well as spiritual sphere and friends are accustomed to address one another by their first names.

The Groups hold "house parties" frequently in well known resorts, the attendance being large and often influential. Critics of the movement suggest that there is too much seeking and advertising of prominent and wealthy adherents, and latterly the Groups have developed their activities somewhat on the spectacular side. On the other hand, there is clear evidence that many lives have been—to use a Group word—fulfilled. The movement is especially successful in Great Britain, South Africa and the Scandinavian countries.

**Oxford University.** In recent years the recognition of the educational value of new subjects, together with the greater specialization of research, has led to certain related developments in the university. The problem of administration has been to foster these developments without prejudice to the traditional disciplines.

In 1937 there were 4,920 students in residence (4,057 men and 863 women), some of whom were reading for diplomas, research degrees or pass schools, or were special classes of students, such as civil service probationers. Less than 200 were reading for pass schools.

Since 1931, research students have increased from 240 to 398. The biggest percentage increases are in Literae Humaniores ("greats") (20-41), social studies (12-41), and Oriental languages (3-13).

The most significant new university (as apart from college) buildings undertaken or projected since 1926 are: (a) extensions of the Ashmolean museum of art and archaeology, the Taylor institution (modern language libraries and lecture-rooms), the Bodleian library, including the Radcliffe science library; (b) new laboratories for physics, physical chemistry and geology, and (c) new quarters for St. Catherine's Society.

Benefactions include gifts for the extension of the Bodleian library (of nearly £600,000), for the Ashmolean museum, and for archaeological studies. The outstanding gifts in recent years have been £2,200,000 and £1,000,000 respectively from Lord Nuffield for the medical school and for a post-graduate college, devoted especially to social studies. In 1937, a special appeal raised over £420,000, of which £250,000 completes the endowment of the Bodleian extension. (D. V.)

**Pacific Islands, British.** (See also FIJI; PACIFIC ISLANDS, MANDATED; NEW GUINEA; NEW ZEALAND, DOMINION OF; SAMOA.) British possessions in the Pacific ocean, apart from the Eastern dependencies, include the groups listed below and many smaller islands. They are governed under a high commissioner for the western Pacific, who is also governor of Fiji; the present high commissioner is Sir A. F. Richards, K.C.M.G.

**The British Solomon Islands Protectorate** comprises Guadalcanar, Malaita, San Cristoval, Isabel, Choiseul, New Georgia and other islands (including the Santa Cruz group), east of New Guinea. Administrative capital, Tulagi. Total land area, 15,000 square miles. Population (1931): 497 Europeans, 193 Asiatics, 93,415 natives. Revenue (1935-36), £58,465; expenditure £49,224. Exports (1935-36), £198,358, mostly copra and trocas shell; imports, £150,163.

**Gilbert and Ellice Islands Colony** includes the Gilbert group, the Ellice group, Ocean island (seat of government), Fanning island, and Christmas island. Population: Gilbert island (1936), 92 Europeans, 26,153 others; Ellice island (1935), 1 European, 4,220 others; Ocean island (1936), 195 Europeans, 495 Asiatics, 1,992

others; Fanning island (1936), 42 Europeans, 272 others; Christmas island (1927), 5 Europeans, 18 others. Total area, 204 sq.mi., excluding Christmas island, which is an atoll roomi. in circumference.

Revenue of the colony (1934-35), £52,922; expenditure, £53,983. Exports (1935), £340,068, chiefly phosphates and copra; imports, £117,060.

**The Tonga Protectorate** (the Friendly islands). Ruler, Queen Salote. Seat of government, Nukualofa. Area, 250 sq.mi.; population (1936), 342 Europeans, 499 half-castes, 31,604 Tongans. Revenue (1935-36), £66,660; expenditure, £49,904. Exports (1936), £116,539, mostly copra; imports, £92,296.

**The Phoenix Islands.**—Area, 16 sq.mi.; population, 59.

**Pitcairn Island.**—Area, 2 square miles. Pop. (1936), 202, descendants of the mutineers of H.M.S. "Bounty."

Great Britain reaffirmed, in Aug. 1937, the annexation of three uninhabited islands in the Pacific, valuable as airports or bases: Henderson island, north-east of Pitcairn; and Ducie and Oeno, north of Pitcairn. (H. V. H.)

## Pacific Islands, French.

The most important of these are New Caledonia and Tahiti.

**New Caledonia** has area 8,548 sq.mi., and population (1931) 57,164 (28,500 Polynesian and Melanesian). The capital is Nouméa (10,700). The governor is B. Siadous, appointed 1933. Economic activity improved slightly in 1937, and exports of frozen meat, copra, coffee, etc., are increasing. There are 9,884,000 ac. pasture, 11,119 ac. copra, and 8,648 ac. coffee under cultivation.

The development of mining has necessitated the immigration of coolies from Annam and Java.

**Tahiti** has area about 600 sq.mi., and population (1931) 16,781. The biggest town is Papeete (7,061). The governor, since 1935, of the islands of which Tahiti is the most important, is H. Sautot. Exports of copra, phosphates, and vanilla have increased slightly. A rather serious social problem is raised by the presence of a too large and not easily assimilable Chinese colony. (See also NEW HEBRIDES.)

## Pacific Islands, Mandated.

These former German possessions in the western Pacific comprise part of New Guinea (*q.v.*) with adjacent archipelagos, western Samoa (*q.v.*), the Marshall, Caroline, Palau, and Ladrone or Marianne islands (all north of the Equator, and administered by Japan as mandatory), and the islet of Nauru, the mandate for which is held jointly by the United Kingdom, Australia, and New Zealand.

**The Japanese Mandate.**—The Marshall islands comprise 24 islands, the chief of which is Jaluit, the seat of government. Population (1933): 433 Japanese, 9,868 natives, 10 others. The Carolines, including the Pelew or Palau islands, consist of about 549 islets, the seats of government being Palau and Yap (western group) and Truk and Ponapé (eastern group).

Population (1934): 7,213 Japanese, 30,272 natives, 69 others. The Marianne or Ladrone group consists of 14 islands (245 square miles). The seat of government is Sipan. Population (1935): 19,835 Japanese, 49,695 natives. Estimated revenue and expenditure of all the Japanese mandated islands in 1935-36 was Yen 5,978,000.

**Nauru** lies 26 mi. south of the Equator, in long. 166° E. Area: 5,396 acres. Population (1936), 179 Europeans, 1,647 Nauruans, 4 other islanders, 1,092 Chinese. Administrator, Commander R. C. Garsia, R.A.N. Revenue (1935), £23,487; expenditure, £20,666. In 1936, 826,379 tons of phosphates were exported; imports (1935) were valued at £168,595. (H. V. H.)

## Pacific Relations, Institute of.

The next triennial conference of the Institute of Pacific Relations will be in the autumn of 1939 in probably Honolulu, Manila or Java, to be announced later. The Institute, whose objectives are the furthering of amity and progress among nations bordering on the Pacific ocean, held its previous and sixth conference in 1936 in Yosemite National park, California, at which meeting the late Newton D. Baker, U.S. Secretary of War during the World War, presided. At that conference attendance was represented by the following member organizations:

The American Council, Institute of Pacific Relations, secretary, Frederick V. Field, 129 East 52nd st., New York city. Royal Institute of International Affairs, secretary, Ivison S. Macadam, Chatham House, 10 St. James square, London, S.W.1. Australian Institute of International Affairs, honorary secretary, Jack Shepherd, 369 George street Chambers, Sydney. Canadian Institute of International Affairs, secretary, Estcott Reid, 43 St. George st., Toronto. China Institute of Pacific Relations, secretary, Lin Yu-Wan, 123 Boulevard de Montigny, Shanghai. Comité d'Etude des Problèmes du Pacifique, secretary general, Roger Levy, 2 rue du Four, Paris. Japanese Council, Institute of Pacific Relations, secretary, Tomohiko Ushiba, Nihon Kokusai Kyokai, 12 Ni-chome, Marunouchi, Tokyo. Netherlands-Netherlands Indies Council, Institute of Pacific Relations, honorary secretary, J. H. Boeke, 18 Warmonderweg, Oegstgeest bij Leiden. New Zealand Branch, Institute of Pacific Relations, honorary secretary, Bruce Turner, Office of Minister of Finance, Parliament building, Wellington. Philippine Council, Institute of Pacific Relations, honorary secretary, Conrado Benitez, University of the Philippines, Manila. U.S.S.R. Council, secretary general, Y. P. Bremman, Pacific Institute, 20' Rozin st., Moscow.

**Pacifism.** During 1937, pacifism was chiefly brought to the notice of the public in Great Britain through the growth of the Peace Pledge Union. This body arose from the suggestion, made in 1934 by the late Canon H. R. L. Sheppard, that those who could sign a pledge "I renounce war and will never support or sanction another" should send him a postcard. The response was so great, that some kind of organization of signatories became inevitable. At the end of 1937, the membership, organized in 745 groups, consisted of 140,000 persons, 25% of whom were women recently admitted. This total takes into consideration a drastic winnowing of names during the year, for a good many who had taken the pledge realized later—largely because of the civil war in Spain or the call for a boycott of Japanese goods after the invasion of China—that they could not accept the full pacifist position.

The growth of the pacifist movement in the Christian churches was evidenced by the congress at Edinburgh in the summer of the Ministers' International Peace Union, attended by clergy of many countries. The Council of Christian Pacifist Groups, composed of representatives from pacifist organizations in the Anglican, Roman Catholic, and Free Churches, steadily becomes stronger; and one of the constituent bodies, the Methodist Peace Fellowship, includes 749 pacifist ministers. The council is the outcome of the activities of the Fellowship of Reconciliation, an interdenominational pacifist body formed in 1914. From the latter has also grown the American F.O.R. and the international F.O.R., with an office in Paris and considerable work in Europe.

From the wider movement have emerged the Embassies of Reconciliation. The outstanding activity of this body has been the visits of Mr. George Lansbury to Herr Hitler, Signor Mussolini, and the presidents and premiers of Czechoslovakia, Poland, and Austria. Earlier, he had had similar interviews with

THE FATE OF THE DOVE OF PEACE, as pictured by Dubosc in *Le Journal d'Humanité*, Paris

President Roosevelt, M. Blum, M. Van Zeeland, and the ministers of the Scandinavian countries.

The purpose of these visits was to win support for a proposal for a conference of the principal nations for the reconstruction of economic relations as the most practical contribution to general appeasement.

Though the World Conference of the churches on "Church and Community and State," held at Oxford in July, was able unitedly to take the absolute pacifist position, its report included, not only a statement of the pacifist's faith, but also an italicized denunciation of war as "a defiance of the righteousness of God." Moreover, the message of the conference stated, "The Universal Church . . . must pronounce a condemnation of war unqualified and unrestricted."

In the United States, the work begun in the Emergency Peace Campaign in 1936 was continued with considerable success. The American War Resisters' League attained a membership of over 55,000, and a stand was made against military training in colleges. A movement similar to the P.P.U. began in Canada, and there was considerable peace propaganda in the other British Dominions. An All-Ireland anti-war crusade on a full pacifist basis was started at the beginning of the year.

At the conference of the War Resisters' International at Copenhagen in July, it was stated that this body was carrying on work in 68 countries. At that date, over 400 men were known to be in concentration camps or prisons in France, Germany, Poland, Russia, Italy, Bulgaria, Switzerland, and elsewhere, for refusing military service on conscientious grounds. In the Scandinavian countries and Holland, there is some form of civil alternative service which, however, not all the conscripted "objectors" feel able to accept.

As the result of a conference in Paris, attended by 300 delegates, the International Pacifist Association was formed.

Members of the Society of Friends are to be found as active workers in all sections of the peace movement in Great Britain, America, and elsewhere. The society itself has its peace committees, and seeks also to express its Christian pacifist principles

through relief work and through the Quaker centres in several of the capitals of Europe.

Pacifist literature in English-speaking countries during 1937 was strongly reinforced by important books by Aldous Huxley and others. Peace bookshops supplemented the platform and street-corner propaganda of pacifism. (See also WARFARE.)

(H. W. P.E.)

**Paderewski, Ignaz Jan** (1860— ), Polish statesman and pianist. For a biography, see *Encyclopædia Britannica*, vol. 17, p. 22. Since 1925 he has resided at Morges, Switzerland. In the summer of 1937 his interview with General Holler and General Sikowski, ex-premier and war minister of Poland, attracted some attention in Warsaw, and gave rise to rumours about "the Morges front"; and in August he circulated a manifesto opposing incipient leanings towards Fascism in Poland and demanding freedom for the peasants. In September he again supported the peasants in an article in a Silesian paper, circulation of which was banned in Warsaw; and a few weeks later issued an open letter to the premier, declaring that Poland needed no dictators and rallying the people to the democratic ideal. He was awarded the G.B.E. in 1925.

**Page, Thomas Walker** (1866-1937), American economist who, in addition to acting as professor of economics at the University of Virginia from 1906-22, was chairman of the U.S. Tariff Commission from 1920-22 and vice chairman after 1930. He was born at Cobham, Va., Dec. 4, 1866, and received the Ph.D. degree from the University of Leipzig in 1896. From 1900-06 he served in posts at the universities of California and Texas. In 1926 he was American expert on the League of Nations committee which planned the World Economic Conference of 1927; and in 1934 he was appointed chairman of the Interdepartmental Committee for Reciprocity Information. In hope of promoting peace, he advocated establishment of a division of the World Court to which international trade disputes might be referred. He died at Charlottesville, Va., Jan. 13, 1937.

**Pageant of the Pacific:** see FAIRS AND EXHIBITIONS.

**Paine, Albert Bigelow** (1861-1937), American author, whose most important work was a three-volume biography of Mark Twain (1912). In addition to shorter works on Mark Twain, his other biographies included studies of Thomas Nast, George F. Baker, Lillian Gish and Joan of Arc, the French Government making him a chevalier of the Legion of Honour for his work on the Maid of France. Mr. Paine was born at New Bedford, Mass., July 10, 1861. One of the editors of *St. Nicholas Magazine* (1899-1909), he wrote several children's books as well as novels and travel studies. His death occurred at New Smyrna, Fla., April 9, 1937.

**Painting.** The art of painting, in the year 1937, was conspicuously devoid of sensational disturbances and of the belligerent efforts of subversive factions to destroy traditional standards of intelligence and taste. No new artists of international significance were discovered; no hysterical cults were born; no esoteric school arose to shock the public and win its day of notoriety. It is true that one sect, the Surrealists, attracted considerable publicity in France, England, and America; but the works of this sect, belated mixtures of subconscious debris and showmanship, were received by the public with amusement or mild indignation. As regards the contentious question of the relation of art to politics, it might be pointed out that in 1937,

"TORNADO," by John Stuart Curry, painter of the Kansas Plains

the increasing alarms and uncertainties of the world engaged the attention of groups of painters everywhere, leading them strongly to nationalistic utterances and to the opposition of war in all its forms. But the main body of artists, generally speaking, continued to work according to individual predilections, leaving political issues to statesmen and dictators.

**United States.**—In external manifestations, America was extraordinarily active in the year 1937. Art, for once, enjoyed a general awakening and contributed in no small measure to the excited spirit of nationalism. The major impetus in this direction, so far as commissions are concerned, came from the Federal Government which, having erected an elaborate machinery of administration, appropriated vast sums of money not only for the material assistance of needy artists but also for mural decorations in all parts of the country. The granting of Federal subsidies was not entirely beneficial: amateurs, in wholesale lots, were suddenly promoted to the ranks of the professionals; political influence often played a part in the awarding of important commissions, and many artists were disposed to leave their destiny to the whims or dictates of the State. But no artists of proved ability were ignored; and the bureaucrats at Washington, by co-operating with regional boards of control, rendered great service to the cause of American art.

More significant than Federal participation was the rise to national prominence of a school of native painters united in the determination to promote independence of thought and action by portraying the actualities of American life. The leaders of the school, Thomas Hart Benton, John Stuart Curry, Grant Wood, Charles Burchfield, and Reginald Marsh, succeeded in removing art from the jurisdiction of specialists and fanatics, and bringing

it close to the life of the common man. Aroused to action by a wealth of material hitherto proscribed on the grounds of vulgarity, they painted mural decorations of the transition of a pioneer civilization to industrialism, and easel studies of the picturesque difficulties of cotton planters, the dramatic aspects of plains and mountains, the migrations from the soil to the cities—the rapidity, turmoil and colour of a restless nation. These men and their followers founded a popular movement in art which, on the basis of accomplished work, marks the end of American subservience to European cultural fashions.

**Great Britain.**—In England, perhaps more than in any other country, painters refused to participate in enterprises to save or reform the world. The British Artists' Congress endorsed the stand of the American Artists' Congress in the latter's campaign for peace and democracy; and when Germany invited British painters to exhibit in Berlin, with specific reservations as to race and political faith, the invitation was promptly rejected. Apart from these minor flurries, the course of painting was characterized by its exceptional tranquillity and the even tenor of collective and individual aims.

Collectively, painters deviated little from the methods and practices of three schools, or influences, at work in England for many years. The first and oldest school, composed of members of the Royal Academy and the Royal Institute of Oil Painters, with their innumerable disciples, contributed nothing of particular distinction to the year's procession of pictures. The Royal Academy exhibition was technically competent but uninspired; the Royal Institute presented its usual array of conventionally safe and unarresting canvases; and coronation art, in oils and ceremonial accessories alike, was unfortunately entrusted to commercial producers.

Academic art, however, redeemed itself in a comprehensive showing of the works of Sir Joshua Reynolds—100 canvases representing the British master at every period of his career. The second school, founded on the open-air realism of Constable and the colour principles of Impressionism, maintained its prestige through its official organization, The New English Art Club, and delighted the public with notable exhibitions of paintings by P. Wilson Steer and the landscape art of R. O. Dunlop. The aims and methods of this school were more authoritatively exemplified in two centennial exhibitions of Constable's oils and water colours.

The third school, numerically small and still in bad odour with the public, continued to battle, though somewhat perfunctorily, for non-representational art and the structural devices of Cézanne. Once regarded as sensational in the extreme, the work of such modernists as Duncan Grant, Paul and John Nash, Henry Lamb, C. R. W. Nevinson, Stanley and Gilbert Spencer, and Wyndham Lewis, was overshadowed by the nightmares and eccentricities of

AMONG THE FOREMOST AMERICAN ARTISTS are, left to right: John Stuart Curry, Charles E. Burchfield, John Sloan, Thomas Hart Benton

"NOVEMBER EVENING," by Charles Burchfield, a sombre study of the Mid-west

the Surrealists. Led by the Spaniard, Salvador Dali, and a handful of British devotees, the Surrealists succeeded in infuriating the average artist and his clientele by exhibiting impossible combinations of objects in which the facts of life were distorted to symbolize Freudian dreams and abnormalities.

The influence of French Impressionism and Post-Impressionism suffered a perceptible decline in 1937, but to the collectors and dealers the French remained the masters of modern painting. Exhibition after exhibition of Gallic painting, from Ingres to Matisse, filled the London galleries, gaining the approbation of connoisseurs but adding the most formidable competition to the difficulties of the British painter.

**France.**—France, the home of modern radicalism in painting and perennially the storm-centre of controversy, was content to rest on her laurels and cultivate her foreign markets. The present School of Paris which, in its formative stage, precipitated a succession of bloodless eruptions and revolts, was officially sanctioned by the State in 1937, and allotted an exhibition room in an enormous retrospective showing of French painting. Thus the most rebellious uprising in modern art was incorporated with the French tradition as an orthodox development. Picasso, the undisputed master of the school, and his confrères, Matisse, Braque, Rouault, Lurçat, Dufy, and Leger, maintained the international prominence of Cubism and abstract design not only by their official victory in Paris but also by many exhibitions in London and New York where their canvases continued to fetch high prices. Picasso, a Spanish expatriate, enhanced his reputation by accepting the post of non-resident director of the Prado museum, and by rallying his fellow painters in active support of the royalists in Spain. This political gesture, together with a noisy demonstration of Surrealism, lent colour and excitement to an otherwise uneventful year.

While the modernists were industriously capitalizing their offi-

cial recognition, the conservative elements of French painting were not idle. The old salons, always popular with the fashionable world, but vigorously discountenanced by the followers of Cézanne, appeared again with something of their former splendour, exhibiting figure studies as correct as those of Bouguereau, and portraits in the style of Manet and Courbet. A new school of romanticists was consolidated, a group of younger artists who, in their repudiation of non-representational art, returned to the invigorating subject-pictures of Delacroix and painted dramatic conceptions for the glory of France. A third element, a decorous offshoot of Modernism, refining the styles of Cézanne, Van Gogh and Gauguin into decorations acceptable to academic juries, produced charming garniture for drawing rooms. But the activities and disagreements of the various schools were reduced to temporary unimportance by the historical loan-exhibition of French painting from the 16th century to the present time, a magnificent presentation made possible by the courtesy of European and American collectors. In this great survey the continuity of the French tradition was convincingly revealed: the passion for order and precision, the tendency towards the formalization of nature, and finally, in contemporary examples, the triumph of pattern over content, or subject-matter.

**Germany, Italy, Russia, Spain.**—In Germany, the trend of painting, by official decree, was reactionary and opposed to modernism in all its ramifications. So strong was government sentiment against contemporary French art and the various experimental schools, that many German painters of modernist affiliations, unable to work in a hostile atmosphere and denied exhibitions, emigrated to France and America. The art approved and stipulated by the State was a safe and sound art, romantic in conception, laboriously detailed and scrupulously exact in draughtsmanship. Imbued with romantic ideas, young German enthusiasts returned to the grandiose imaginings of Caspar David Friedrich and the men of the early 19th century. When working for the State, artists were regimented like soldiers, but no definite propaganda was required of them save an allegiance to the general policy of a strictly Germanic ideology. Modernist exhibitions were permitted only for educational purposes, that is to say, as examples of forbidden art, but such exhibitions seldom failed to attract large and sympathetic audiences.

In Italy there was no intervention on the part of the State, so long as artists signified their loyalty, and no official preferences for one school above another. The conservative painters, numerically preponderant, remained aloof from politics, but the more radical groups like the Futurists converted their symbolical apparatus into a flamboyant glorification of Fascism. Russia, after holding art for years in the most rigorous service of Soviet economics, relaxed her authoritarian principles and allowed the creative impulse more freedom. The result was a quiet growth of

LEADING MODERN AMERICAN PAINTERS include, left to right: Paul Cadmus, William Gropper, Grant Wood, Reginald Marsh

JEWISH WHEAT FIELD set afire by Arabs, an incident in the bloody, destructive vendetta between Jewish colonists in Palestine and native Arabs

more spontaneous painting, some of it idyllic and reminiscent of folk art. In Spain, current production was virtually non-existent, painters of all denominations either fighting on the battlefield or fighting to save the art treasures of Spain from the depredations of war.

(T. CR.)

**Paints and Varnishes.** Expansion during 1937 was due in some measure to the international armaments program, requiring finishes for ship building, aircraft construction, and the like, and to continued building. Manufacturers are now realizing that while some paint mills are suitable for making certain paints, other formulations require different types of mill. There was a marked increase in the use of the pressure bar single roll mill; for reasons of economical operation and where quantities of thinners are involved, ball and pebble mills found more extensive use.

Marked progress in finished paints was made by the use of media prepared from synthetic resins; alkyd resins were to the fore in this respect. A comprehensive system of house paint classifications has been perfected.

Developments in pigments centred round particle size and shape and conversion of pigment water to pigment oil dispersions. Progress in white pigments includes the discovery of an organic pigment prepared by reaction between polyhalogenated aralkyl halides and alkali metal salts of halogenated phenols. Heat and hydrolysis resistance and high refractive index were claimed. Graphite was suggested as an anticorrosive pigment; outstanding properties were claimed.

The trend in driers is towards materials causing film drying without further oxidation effect; production on a commercial scale of monoglycerides of drying oils produced new possibilities. Work continues on this problem.

While paint manufacture is carried on in most countries, the largest output may be credited to the United States, Great Britain, and Germany.

Available data for the United States give the gross value of products as \$289,441,956 (£57,888,391) for 1933, with 22,880 employees engaged, and 1936 Dominion Bureau of Statistics returns for the Canadian industry gave gross value of products as \$22,651,225 (£4,530,245) with 3,124 persons employed. (See also TITANIUM.)

(F. B. F.)

**Palaeontology**, like its fellow science of zoology, has reached a stage in which few startling developments are to be expected. The past year has proved no

exception to this, but has produced a considerable number of excellent and well illustrated descriptive papers which are of interest to the specialist alone. Though no group is outstanding in this respect, mention may, perhaps, be made of the many admirable studies of fossil fish.

The economic application of palaeontology is well marked in comparison with other branches of geology, but it is regarded in this case only as a means to an end, that is, as a key to historical geology. Detailed stratigraphical knowledge is necessary, in particular, to the oil geologist, who is so greatly in demand at the present time, and this knowledge must be based largely on an intimate acquaintance with the fauna of the formations in question. Thus the various oil companies have done much to foster the training of students in the study of those groups which they are most likely to meet in oil-fields. As a result of this, the Ostracods and Foraminifera have come in for a great deal of attention, especially in American universities. There is the danger, however, that in a period of economic expansion, such as is now being experienced, the purely practical side of the science may be over-stressed at the expense of the more fundamental evolutionary side, which does, indeed, sometimes tend to modify or even disprove the working rules by which the stratigrapher is guided.

Much good work has been accomplished recently in the coal-fields of Great Britain and America, where a detailed examination of both fauna and flora has not only contributed to the science, but has developed new methods of zoning which are of very definite practical value.

(F. WAL.)

**Palestine.** Palestine lies on the western edge of Asia, being bounded on the west by the Mediterranean, on the south-west by Egypt, on the south by the gulf of Aqaba, on the east by Trans-Jordan, on the north-east by Syria, and on the north by the Lebanon. It is administered by Great Britain under a mandate from the League of Nations. The powers of the mandatory are exercised by a high commissioner resident in Jerusalem. General Sir Arthur Grenfell Wauchope, G.C.M.G., K.C.B., C.I.E., D.S.O., high commissioner since 1931, retired at the end of Feb. 1938, Sir Harold Alfred MacMichael, K.C.M.G., D.S.O., having been appointed to succeed him.

**Area, Population, and Cities.**—Palestine is about the size of Maryland, having an area of about 10,100 square miles. No census

has been taken since 1931, but the population is now estimated to be approximately 1,400,000, consisting roughly of one million Arabs and 400,000 Jews. Of the former, one in nine is a Christian, the rest are Moslems. The population has grown rapidly under the mandatory régime, owing to a falling death-rate among the Arabs and a large immigration of Jews from eastern and central Europe. Jewish immigration, which totalled 290,000 between 1919 and 1936, reached a climax in 1935 with a figure of 61,854, but has since diminished.

Jewish immigrants in first seven months of 1935: 35,637.

Jewish immigrants in first seven months of 1936: 18,610.

Jewish immigrants in first seven months of 1937: 6,760.

Until 1937, there was no limit to the entry of persons having a capital of at least £P.1,000; the remainder, apart from dependents, entered under the Labour Schedules drawn up every six months in accordance with the Government's estimate of the country's economic absorptive capacity. In July, however, the Mandatory Power announced the restriction of Jewish immigration in all categories, between Aug. 1937 and March 1938, to a total of 8,000. This was an interim measure, designed to relieve tension while a scheme of partition (*see below*) was being worked out.

English, Arabic, and Hebrew are all recognized as official languages. There are, apart from a number of private schools, two entirely distinct educational systems, the one administered directly by the Department of Education and giving instruction in Arabic, the other controlled by the Va'ad Leumi (Jewish General Council) and using the Hebrew language. The Government's expenditure on education is divided between the two systems in proportions determined by the ratio between the numbers of Arab and Jewish children of school age. These grants are inadequate to provide universal elementary education, but this is ensured, on the Jewish side, by voluntary effort.

The largest town in Palestine is Tel Aviv, with an exclusively Jewish population of 150,000. There follow Jerusalem, with 120,000, of whom 60% are Jews, and Haifa, with 100,000 and a slight Jewish majority. The only other town of considerable size is the predominantly Arab port of Jaffa, with 70,000 inhabitants.

**History.**—The resentment of the Arabs against the establishment, under the terms of the mandate, of a Jewish National Home in Palestine came to a head in 1936. A general strike began in April and continued into October. During the whole of that period there were attacks by armed Arabs on Jewish settlements, British troops, and the local police, accompanied by the destruction of Jewish crops and the sabotage of communications, and developing finally into guerilla warfare. Thirty-seven members of the defence forces and 82 Jews were killed, while not less than 1,000 Arabs lost their lives. His Majesty's Government appointed a Royal Commission, under the chairmanship of the late Earl Peel, to investigate the underlying causes of these disturbances and to make recommendations for the prevention of their recurrence. The commissioners were in Palestine from Nov. 1936 to Jan. 1937, and their report was published on July 7, 1937. They found that the underlying causes of the outbreak were the desire of the

Arabs for national independence and their fear of political domination by the Jews. Of the other Arab countries placed under "A" mandates by the peace treaties, Iraq is already a sovereign State, Syria and the Lebanon have secured a treaty which ensures their emancipation within two years, and even backward Trans-Jordan has been recognized as an "independent government." In Palestine alone no important step has yet been taken towards self-government, because any power conceded to the Arab majority would have been used to hinder the development of the Jewish National Home. Thus the clauses of the mandate which are vital to the Jews have frustrated what the Arabs regard as its essential purpose, the fostering of self-governing institutions. They feared, furthermore, that the independence which was being withheld while they were in a majority would be granted as soon as the Jews outnumbered them. They therefore demanded the cessation of Jewish immigration and the establishment of representative government. These demands could not be granted without a violation of the pledges given by Great Britain to the Jews; their refusal, on the other hand, would involve subjecting the Arabs to "a sort of creeping conquest." Having stated this dilemma, the commissioners proposed as an escape from it the partition of Palestine into two independent States. As an indication of how this might be done, but without committing themselves to its detail, they submitted the following plan: (1) a Jewish State consisting of Galilee, the Plain of Esdraelon, and the Maritime Plain as far as a point about 10 miles south of Rehovot; this would include most of the areas in which there has been a large Jewish settlement; (2) an Arab State consisting of the greater part of Palestine to the south and east of the Jewish frontier, together with Trans-Jordan; (3) a permanent British mandate over the Holy Places of Jerusalem, Bethlehem, and Nazareth, with a corridor connecting the first two with the sea. The port of Jaffa, however, was to belong to the Arab State. Treaties in accordance with the precedents of Iraq and Syria would be concluded between Great Britain on the one hand and the Jewish and Arab Governments on the other. They should contain guarantees for the protection of minorities, and for transit facilities for Arab trade through Haifa and Jewish trade with Egypt.

The Mandatory Power would retain an enclave on the Gulf of Aqaba, and temporary control of the mixed towns of Haifa, Acre, Safad, and Tiberias.

The British Government announced, simultaneously with the publication of the report, its endorsement of the principle of partition. On July 21, the House of Commons, without committing itself to that policy, authorized its submission to the League of Nations. The Peel Report was then examined at an Extraordinary Session of the Permanent Mandates Commission, from July 30 to Aug. 18. Reporting to the Council of the League, this body declared itself favourable to the preparation, by the Mandatory Power, of a definite plan involving partition, but opposed to the immediate concession of independence to the two States which would thus be created. There should be a period either of provincial autonomy under a central authority presided over by the mandatory, or two new mandates. In September the Council

BRITISH ROYAL COMMISSION for Palestine to determine means of settling intercommunal strife between Jews and Arabs. Left to right. Professor Reginald Coupland, Sir Egbert Laurie, Sir Horace Rumbold, Earl Peel, chairman

of the League authorized the British Government to work out the details of a scheme for submission to a future meeting of the Council. Speaking in the House of Commons on October 21, the colonial secretary announced that a special committee was to be appointed for this purpose; it would not, however, begin its work until order had been fully established in Palestine.

There had been a renewal of terrorist activity in February, March, and April, and after a lull in the early summer, it began again in August. On September 26, Mr. L. Y. Andrews, acting district commissioner of Galilee, was shot dead outside the Anglican church at Nazareth. The Government thereupon decided on stronger measures than had hitherto been taken. The Higher Arab Committee, the unofficial body which had assumed direction of the strike in 1936, was declared an unlawful association, and four of its members were deported to the Seychelles. Its leader, Haj Amin Effendi Al Husseini, the Mufti of Jerusalem, was deprived of his offices as President of the Moslem Supreme Council and chairman of the General Waqf Committee, the body controlling the disposition of religious funds. A fortnight later he fled from Palestine and went to Beirut.

Meanwhile, an order was published authorizing condemnation for murder on the uncorroborated evidence of a single witness. Sir Charles Tegart, formerly of the Indian police, was appointed to advise the Government on methods of dealing with terrorism. And on November 18 military courts were established throughout Palestine, with power to try persons accused of carrying or discharging firearms—either of these offences was to be punishable by death—or of causing sabotage and intimidation. The sentences of these courts are subject to confirmation by the general officer commanding the British troops in Palestine, and from his decision there is no appeal.

Despite the dispersion of the Arab leaders and the speedy infliction of the first death sentence, acts of terrorism remained as numerous as before.

Arab opposition to the idea of partition was uncompromising and unanimous. It was reiterated, after the flight of the Mufti, by Ragheb Bey Nashashibi, leader of the National Defence Party, which is generally regarded as the moderate wing of the Arab movement. Nor was this feeling confined to Palestine. The publication of the report drew immediate protests from the prime minister of Iraq and the president of the All-India Moslem League; it was the subject of official representations by the Iraqi Government at Geneva, and was condemned by the Egyptian delegate to the Assembly of the League.

On September 8, a pan-Arab Congress opened at Bloudan, in Syria, with delegates from all the Arab countries except the Yemen. Speeches were made warning Great Britain that if she continued to support Zionism, she would no longer be able to count on the friendship of the Arab peoples.

On the Jewish side opinion was less definite. All sections were opposed to the scheme suggested by the Peel commission, but to many the principle of partition was acceptable, because immigration into a Jewish State would, for a period at least, be on a more generous scale than under the mandate. At the 20th Zionist Congress, held at Zürich in August, the majority of the General Zionists and the Labour Party followed Dr. Weizmann's lead, and carried resolutions empowering the executive to ascertain the precise intentions of the British Government and lay them before a newly elected Congress.

The year closed, therefore, in an atmosphere of uncertainty, and the persistence of disorder in Palestine still prevented the Mandatory Power from appointing the committee whose work will enable it to define its intentions more clearly.

**Trade and Communications.**—Since the Balfour Declaration, the Jewish people have sunk some £P. 80 millions of capital

in Palestine, and this money, harnessed to the energy of the Jewish settlers, has transformed the country from a backward community of subsistence farmers into a versatile and prosperous economic organism.

Exports from Palestine are dominated by citrus fruits, which have accounted in recent years for over 80% of the total value. Of these the bulk are oranges, though there is an increasing production of grapefruit. The export of these crops, which is carried on from November to April, rose steadily to 7,331,000 cases in 1934–35, fell to 5,897,000 in 1935–36, and reached 10,779,000 in 1936–37. Although prices were low owing to the dumping of Spanish oranges, this record output enabled Palestine to show a substantial increase in the value of her export trade during the first eight months of 1937:

	Exports	Imports
First 8 months of 1935 . . .	£P. 3,358,000	£P. 11,597,000
First 8 months of 1936 . . .	£P. 2,393,000	£P. 8,597,000
First 8 months of 1937 . . .	£P. 4,003,000	£P. 10,622,000

As well over half the exports fall in the first quarter of the year, this table does not give an adequate impression of the adverse balance of visible trade; in 1935 it reached £P. 13,638,000 on a total foreign trade of just over £P. 22 millions. The gap between exports and imports is only partially closed by the receipts of tourist traffic, the proceeds of Zionist funds, and the import of capital by immigrants. The Peel commission recommended the opening of negotiations for the revision of article 18 of the mandate, which precludes Palestine from taking any fiscal measures which would result in discrimination against States-members of the League of Nations.

There have been important developments in communications during 1937. The Government has constructed a through road from Tel Aviv to Haifa, thus linking the two major industrial centres. And the port of Tel Aviv, established as a temporary inlet for certain classes of goods while Jaffa was incapacitated by the strike in 1936, has been granted the right to handle all classes of merchandise. Palestine is increasingly important as a centre of civil aviation. Gaza and Lydda are stopping-places respectively for Imperial Airways, Ltd. between England and Australia, and for the Royal Dutch Air Line between Holland and the East Indies. An Egyptian line uses the airport at Haifa and continues to Baghdad.

**Finance and Banking.**—The unit of currency is the Palestinian pound, at parity with sterling; it is divided into 1,000 mils. In March 1936, following a series of prosperous years, the Treasury had an accumulated surplus of £P. 6,268,000. The disturbances of April–October, however, resulted in a deficit of £P. 1,396,000 on the year ending March 31, 1937. The revenue returns for April–July 1937 showed an increase of 17% on the corresponding period of the previous year.

**Defence Forces.**—The British forces normally stationed in Palestine before the outbreak of 1936 consisted of two infantry battalions, one Royal Air Force flight, and three sections of an armoured car company. Early in 1937 there were, in addition to this garrison, six more infantry battalions and a field company of the Royal Engineers. The War Office announced at the end of July that Major-General A. P. Wavell had been appointed general officer commanding the British forces in Palestine and Trans-Jordan, in succession to Lieut.-General J. C. Dill. (See also ISLAM; MEDITERRANEAN, THE.)

**BIBLIOGRAPHY.**—*Great Britain and Palestine, 1915–1936* (Royal Institute of International Affairs: Information Department Papers, No. 20, 1937); *Report of the Palestine Royal Commission* (Cmd. 5479 of 1937). (H. Bv.)

**Panamá**, a republic at the juncture of Central and South America; language, Spanish; capital, Panamá; president, Dr. Juan D. Arosemena. The area is 34,169 sq.mi., including the Canal Zone. The population by the 1930 census was 467,459, and was officially estimated as 534,631 in 1936. The chief cities (with 1930 populations) are Panamá, 82,327, and Colon, 33,460. Some popular dissatisfaction was manifested in 1937, but President Arosemena's firm stand against anti-Government agitation prevented any serious disturbance.

On Dec. 6, the Government announced the final adjustment of boundary issues with Colombia, left unsettled since 1922. Panamá has 257 miles of railways and 797kms. of highways, with 154.5 kms. under construction in 1937. Her strategic position in relation to all parts of the hemisphere make her the hub of inter-American aviation. Imports, principally foodstuffs and manufactured articles, totalled 18,989,846 balboas in 1936, with the United States supplying 51.5% and Japan 15.7%. Exports were 7,559,179 balboas, with bananas aggregating a third of the total. Demands of the Canal tourist and other traffic tend to balance exports and imports. Gold-mining is increasing in importance, with an output of 400,000 balboas in 1936. The monetary unit is the balboa (value: approx. 50¢ U.S.). The 1937-38 budget calls for 18,813,700 balboas, of which 3,417,351 balboas is for payment on the public debt. Public debt totalled 18,880,758 balboas in 1936. In 1937 there were 581 primary schools (including 509 rural), with an enrolment of 58,231, 4 secondary schools (enrolment 2,537), and a national university. Panamá has no army, but maintains a national police force of approximately 1,000. (L. W. BE.)

**Panama Canal and Canal Zone**, area, 553.8 sq.mi., of which 170.2 are water; population, June 1937, exclusive of Army and Navy personnel, 28,707, of whom 8,685 were from the United States. The length of the canal from shore line to shore line is 40.27m. Both canal and zone belong to the United States.

The Panama canal connects the Atlantic and Pacific oceans through the narrow isthmus of Panama, at approximately 9° N. lat. and 79° W. long. It was opened to traffic on August 15, 1914.

## Vessels Through Canal, Fiscal Year 1936-37

\*Ocean-going commercial vessels, over 300 net tons Panama canal measurement, excluding canal vessels, Army and Navy, Panamanian Government, Colombian Army and Navy vessels.

The gross capital investment adjusted as of July 1, 1937, was \$538,160,473.

Of the total number of commercial transits during the fiscal year ended June 30, 1937, 1,670 were of United States registry, 1,385 British, 674 Norwegian, 332 German, 282 Japanese, 221 Netherlands, 189 Danish, 184 Panamanian, 108 Swedish, 100 French, and the remaining 242 of 21 other nationalities.

The origin and destination by principal trade areas of cargo in vessels passing through the Panama canal during the fiscal year ended June 30, 1937, is shown in the table in the first column. United States traffic was seriously affected from the first week of November 1936 until the middle of February 1937, by the maritime strike in the United States, and is not therefore representative of a normal year.

The principal commodities transported through the canal during the fiscal year ended June 30, 1937, segregated by direction of transit, were as follows:

### From Atlantic to Pacific

	Long tons
Manufacture of iron and steel	1,770,293
Scrap metal	1,666,030
Mineral oils	794,702
Paper and paper products	431,672
Metals, various	379,200
Phosphates	310,015
Cotton, raw	298,300
Tinplate	272,772
Sulphur	253,294

### From Pacific to Atlantic

	Long tons
Mineral oils	3,571,626
Lumber	2,748,917
Ores	1,851,254
Sugar	1,358,948
Nitrate	1,328,482
Wheat	1,218,581
Canned food products	1,092,356
Metals, various	653,250
Food products in cold storage (except fresh fruits)	304,332
Flour	259,389
Fruit, dried	233,957
Fruit, fresh (except bananas)	216,770

During the fiscal year ended June 30, 1937, tolls collections averaged \$4,288 per vessel of over 300 net tons, Panama canal measurement. From the opening of the canal to the end of June 1937, there have been 92,990 transits of such vessels. Tolls collections thereon amounted to \$406,215,948.

Tolls are levied on the net tonnages of ships. Prior to March 1, 1938, the rate for laden ships was \$1.20 per net ton, Panama canal measurement, and for ballast ships \$0.72 per net ton, with the proviso that the amount collectible shall not exceed the equivalent of \$1.25 per net ton as determined under the rules for registry in the United States, or be less than \$0.75 per net ton on the same basis. However, during 1937, legislation was passed by the U.S. Congress, which made the Panama canal rules for

measurement the sole basis for levying tolls. Effective March 1, 1938, tolls will be assessed at \$0.90 per net ton for laden vessels instead of \$1.20 and \$0.72 per net ton for ballast vessels based on new rules of measurement of the Panama canal. The principal changes in the rules are as follows: Double-bottom compartments will be exempted from gross tonnage unless available or used for cargo. Peak tanks will be deductible when used for fresh water for ship's use. An engineer's workshop not to exceed 5% of actual machinery space, or 50 tons in any case, will be deductible. Accommodations for all personnel inscribed on the ship's rolls as crew will be deductible. Spaces for use of passengers solely as public rooms will be deductible.

A concrete dam across the Chagres river at Alhajuela was completed in 1935, creating Madden lake. The entire dam is 974ft. long, 223ft. high, 191ft. wide at the base, 25ft. wide at the top, and contains about 497,000 cu.yds. of material. This lake provides reserve storage of 22 billion cubic feet of water for use in maintaining the level of Gatun lake during dry seasons. A hydroelectric plant of 20,000 KVA capacity is located beside the spillway.

In accordance with a joint resolution of Congress approved May 1, 1936, studies are being made of the possibilities of increasing the capacity of the Canal for the future needs of inter-oceanic shipping. It is not expected that the increased capacity will be needed in the near future and the studies will probably extend over several years. (C. S. Rr.)

**Pan-American Union**, an international body created by the 21 American republics for the fostering of mutual understanding and co-operation, with the essential duty of making effective the resolutions adopted by the successive Pan-American Conferences; headquarters, Washington; director, Dr. Leo S. Rowe. A governing board plans inter-American gatherings for the purpose of conferring on problems of interest to all. The Union is financed by contributions from the 21 members on the basis of population. It collects and publishes cultural, statistical, and other information of Pan-American interest.

In 1937 the Union was active in giving effect to the recommendations of the Buenos Aires Conference of 1936 in the field of economic co-operation and promotion of closer intellectual co-

operation and in extending its good offices and facilities to various conferences. It sponsored a series of cultural radio programs gave aid to a number of special conferences, including the Pan-American Educational Conference (Mexico City), the Inter-American Aviation Conference (Lima), and the Inter-American Radio Conference (Havana), and began preparations for the Eighth International Conference of American States, to be held at Lima in Dec. 1938. (L. W. BE.)

**"Panay":** see CHINESE-JAPANESE WAR: *International Aspects*, INTERNATIONAL LAW: *War in China*; UNITED STATES: *Foreign Affairs*.

**Paper and Pulp Industry.** The paper business in the United Kingdom was excellent in 1936 and 1937. Statistics for production in 1936 (in long tons) based on raw materials used were as follows (1937 will probably be the same or slightly greater):

	Paper	Board
Bleached sulphite . . . . .	117,000	18,000
Unbleached sulphite . . . . .	555,000	25,000
Sulphate . . . . .	212,000	38,000
Mechanical . . . . .	703,000	47,000
Knotter . . . . .	3,000	17,000
Esparto . . . . .	130,000	..
Rags, etc. . . . .	50,000	..
Waste paper . . . . .	10,000	290,000
Loading, etc. . . . .	220,000	15,000
	2,000,000	450,000

Expansion of new mills through the addition of new machines was an outstanding feature of the development of the paper industry in Great Britain. From 1935 to 1937 inclusive, five companies added one or more large machines. Kraft paper production has nearly doubled in the last few years although much of it was made on machines formerly used for other grades.

In the United States the first eight months of 1937 were notable because of the boom conditions that existed. Demand far outran supply and was an important contributing factor toward the rapid expansion in production that was made. By far the great part of this expansion took place in the Southern States where about 20

CHAGRES RIVER DAM, which created Madden lake, a reservoir to maintain the water level in Gatun lake of the Panama canal

new mills were started, which when completed in 1937 and 1938 will represent a total cost of more than \$75,000,000. These mills are almost entirely designed for the manufacture of sulphate pulp, kraft wrapping paper, bags, and kraft liner board. A feature of this development was the number of new mills for the production of bleached sulphate for use in the preparation of white papers such as tissue, book and specialties. Construction on one mill at Fernandina, Fla., has been started to make sulphite pulp for rayon manufacture. Outside of the South there have been but few new mills built, but the expansion in existing mills has been very great.

In Canada the outstanding new mill is the newsprint plant of the Ontario Paper Company at Baie Comeau, Quebec. The expenditure for pulp and paper mill, hydro-electric plant and town-site for 5,000 inhabitants will probably exceed \$30,000,000. In general, business in Canada during 1937 was unusually good. In 1937 there were about 3,646,942 tons of newsprint produced. This is the major paper production of Canada.

The pulp and paper industry in the United States in 1937 was featured by nine months of real prosperity and expansion, followed by three months of serious recession. During the early part of the year there was in fact, a shortage of raw materials, mainly pulp and a tendency on the part of distributors and consumers to buy ahead in anticipation of rising prices. In the early fall, business slowed up rapidly due to fear, and because of reduced advertising appropriations the demand for paper decreased.

There have been no outstanding technical developments in the paper industry during the past two years, although nearly all of the processes and equipment have been improved in detail. In wood pulp production it is noteworthy that pulp for rayon and chemical uses has greatly increased. In the sulphite pulp industry there has been a marked trend toward the use of forced circulation systems and special alloys for pipes and valves. In paper making, an increased use of fillers to obtain greater opacity of printing papers is observed. In the sulphate pulp industry more attention is being paid to the development of new by-products.

Because of the importance of newsprint as a measure of the world's cultural development, it is of interest to note the annual pounds per capita consumption in several countries: United States 57; United Kingdom 55; New Zealand 55; Australia 53; Canada 44; Denmark 30; Sweden 27; Argentina 26; Netherlands 23; Belgium 21; Switzerland 21; Norway 20; France 18; Japan 13; Finland 13; Germany 11; Austria 9; Czechoslovakia 5; Greece 4; Italy 3; Mexico 3; Poland 2; Russia 2; Yugoslavia 1.

(R. G. M.)

PRODUCTION OF NEWSPRINT in the United States and in Canada. Compiled by Newsprint Service Bureau, New York city

Estimated United States Paper Production for 1937  
(In Tons)

	Census 1936	Estimate 1937
Newsprint . . . . .	938,287	966,436
Printing Papers . . . . .	1,636,837	1,781,700
Cover and Writing . . . . .	627,853	646,051

Papua: see NEW GUINEA.

**Paraguay**, an inland republic in Southern South America; language, Spanish; capital, Asunción; provisional president, Felix Paiva. The area, including the Chaco region (approx. 100,000 sq.mi.) disputed with Bolivia, is 173,700 square miles. Population (estimated, 1935) 913,000. The chief cities are: Asunción, 90,000; Villa Rica, 30,000; Villa Concepcion, 25,000.

**History.**—Paraguay is nominally governed by a president and congress under the Constitution of 1870, but the constitution has been suspended, except at brief intervals, for several years. Internal developments in 1937 were essentially the outgrowth of the economic and social conditions resulting from the termination of the Chaco War with Bolivia, and were featured by political instability and revolutionary activity. On March 11, in furtherance of his totalitarian program, Colonel Rafael Franco, provisional president since 1935, placed all industries under Government control, a move bitterly opposed by foreign, especially Argentine, interests in the country. In August, when, in accord with the Chaco peace protocol, Franco ordered the withdrawal of troops from the Chaco, the army refused. On Aug. 13, the cabinet was forced to resign, and, on Aug. 15, President Franco was forced out of office and exiled by a junta which named as provisional president, Dr. Felix Paiva, dean of the faculty of law at the National university and former vice-president. President Paiva restored the constitution and promised early elections, but on Sept. 7, his régime was threatened by an abortive revolt whose objective was the restoration of Franco. After several days of uncertainty the revolt was quelled, and President Paiva assumed dictatorial powers, suspended the constitution, and proclaimed martial law.

On Nov. 8, martial law was lifted, after the suppression of a new Franco revolt. For the most part, Paraguayan foreign relations in 1937 were in connection with the negotiations for a definite settlement of the Chaco dispute with Bolivia (*see* CHACO); but with political instability in both countries, little positive achievement was registered.

In February Paraguay completed her formal withdrawal from the League of Nations.

A tripartite trade agreement was made with Argentina and Bolivia in the same month.

**Trade and Communications.**—External communication is primarily by way of the Paraná river, where regular steamship service is maintained, and by railway and regular air service to Argentina. Paraguay has 264mi. of railroads. Imports (chiefly foodstuffs, textiles, and machinery) in 1935 totalled 11,630,390 gold pesos, with Argentina supplying 50.5% and Japan 14.5%. Exports were valued at 11,396,050 gold pesos, with 31% destined for Argentina, and 55% additional for reshipment from Argentina. Principal export commodities are cotton, quebracho extract, lumber, and hides. Cotton, maté (Paraguay tea), quebracho, lumber-

ing, and cattle are the principal industries. The monetary units are the paper peso and gold peso, both based on Argentine currency. (Value: approx. 1.6¢ and 67¢ U.S.) The national budget for 1937 was \$2,232,939.30. Paraguay has approximately 740 elementary and secondary schools (enrolment about 100,000) and one university. Military service is obligatory. The peacetime army comprises 5,250. (L. W. BE.)

**Parapsychology:** *see* PSYCHICAL RESEARCH; PSYCHOLOGY.

## Parent-Teacher Association, The.

This organization is devoted to child welfare through home and school co-operation and parent education. In the United States there are more than 26,000 of these local associations united under the name of the National Congress of Parents and Teachers with a membership of more than two million. Of this there are branches in all States but one, in Hawaii, in Alaska and in the District of Columbia. Founded in 1897, by Mrs. Theodore W. Birney and Mrs. Phoebe Apperson Hearst, as the Congress of Mothers, it now embraces fathers, mothers, teachers and other interested citizens, while the name has been changed, also, to include them. It maintains headquarters in Washington, D.C., where it was organized. Its authority lies in its Federal charter and its annual convention.

The Parent-Teacher Association is no longer regarded simply as a school auxiliary for supplying material benefits for the school, although they have done this in large measure; its function is now generally conceded to be to create public opinion in favour of better homes, better schools and better communities and to encourage co-operation between home and school. To stimulate its successful functioning there are carefully outlined studies by national and State committees to acquaint the members with physical, mental and emotional conditions of children and how to meet their needs. The Congress of Parents and Teachers publishes an official organ, the *National Parent-Teacher*, a monthly magazine furnishing authoritative information on the rearing and education of children. It publishes, also, many pamphlets and leaflets on these general subjects.

In 1926, the Congress was instrumental in establishing the International Federation of Home and School, the headquarters of which are now in London. There are affiliated in this federation, organizations for home and school co-operation in 27 countries under a variety of names. The International Federation publishes a quarterly magazine called *Home and School* and holds a biennial convention, the latest being in 1937, at Paris. The same general principles and objects motivate the home and school movement wherever it may be found. (M. L. L.)

## Parents and Teachers, National Congress of.

Mrs. J. K. Pettengill of Detroit, Michigan, was elected president of the National Congress of Parents and Teachers at the annual convention in Richmond, Virginia, succeeding Mrs. B. F. Langworthy of Winnetka, Illinois. Activities on the program prepared for 1938 include support for revision of the U.S. Foods and Drug Act, emergency Federal aid for education, abolishing compulsory block-booking and blind selling of cinema films, establishing a Federal Department of Education. Projects supported by the national organization are first endorsed by at least 26 of the 48 State associations of parents and teachers. The national organization now has more than 2,000,000 members, most of whom are parents of children attending public schools. The local associations of parents and teachers number more than 26,000. The national association co-operates

## PARAPSYCHOLOGY—PARIS

in its work with the International Federation of Home and School in England and with similar organizations in 27 other countries. National offices of the congress of parents and teachers are at 1201 16th St., N.W., Washington, D.C.

**Paris.** The life and outward aspect of Paris in 1937 was dominated by preparation for the International Exhibition, and, from the end of May, by the exhibition itself. Nevertheless, the opening of the exhibition, which was to have taken place at the beginning of May, was delayed as a result of the application of social legislation, and thus the number of visitors was fewer than had been hoped—over 31,000,000, as against over 35,000,000 for the Colonial Exhibition. General unrest and monetary difficulties also deterred many foreigners. Still, throughout the summer the influx of visitors restored to Paris its former gaiety and animation. The illuminations of the exhibition and the displays organized by the Comité des Fêtes enjoyed a great success.

The exhibition pavilions lined the two banks of the Seine below the Pont Alexandre III. Although the exhibition is not to be continued in 1938, the architectural patrimony of Paris will be enriched by the new Palais de Chaillot (formerly the Trocadero) and by the two magnificent palaces on the Quai de Tokio, the one national, the other municipal, destined for exhibitions of contemporary art. Further, the Pont d'Iéna has been widened, and the old national warehouses on the Quai d'Orsay demolished.

Considerable works of town improvement have been undertaken both in the city and in the suburbs. The population of Paris in the last census was, in round numbers, 2,871,000, and that of the suburbs 2,042,000 or nearly 5,000,000 for the 118,600 ac. of the Seine department. To this should be added parts of the departments of Seine-et-Oise, Seine-et-Marne, and Oise. The population has spread into the suburbs in recent years, but the increased cost of transport tends to bring people back into the city. The laying-out of the site of the old fortifications has been accomplished, and the front is now a vast circle of gardens, sports grounds, and open spaces. The demolition of 17 blocks of insanitary houses is being undertaken; this will mean the destruction of 4,000 dwellings and the transfer of 200,000 persons. On the site of the first block, huge market halls are being constructed to enlarge the Halles Centrales.

Apart from these large and exacting projects, the principal works realized in 1937 have been a continuation of the great circular road planned to include the old military boulevards, which is becoming a much-used channel of communication. Wide underground passages are being constructed under this road at the busiest crossings; at the Portes de Champerret, de Clichy, d'Italie, de la Villette, Maillot, and Dauphine. The Pont National and the Pont d'Auteuil have been widened. This big circular road should relieve congestion in the heart of Paris. Three new metro lines have been opened, and others prolonged into the suburbs (Neuilly, Montreuil, Sevres, Levallois, Issy). The Sceaux-Massy-Palaiseau railway has been taken over by the Metropolitan Company. In 1937, the first stage was realized in a big scheme for regulating the lines leaving the centre of Paris and radiating out towards the outskirts; the scheme should see completion in three years.

These results are the more remarkable, but also the more costly, in that Paris has had to bear heavy charges in the application of new social legislation; the effect of monetary devaluation must also be remembered. If the total budget figure for 1937 surpassed that of 1936 by 167,000,000, that of 1938 will increase it by 614,000,000. The proportions of the main items of expenditure remain much the same: personnel 40%, debts 25%, police and service 23%, upkeep 12%. The heavy charge for unemployment is covered by the issue of short-term bonds, which, from

time to time, are consolidated by a long-term loan, of which the budget only needs to carry the annual payments. But the debt already amounts to more than 17 milliards.

**House of Lords.**—The number of peers entitled to sit in the House of Lords was (Oct. 1937) 775, comprised as follows: four princes of the blood royal, two archbishops, 20 dukes, 28 marquesses, 125 earls, 77 viscounts, 24 bishops, 464 barons, 16 Scottish representative peers, and 15 Irish representative peers. Only a fraction of this number, however, is at any time politically active in the House, the average attendance being about 80. The speaker is the Lord Chancellor, Viscount Hailsham, and the Lord Chairman of Committees is the Earl of Onslow. Other officers include the clerk of the parliaments, Sir Henry Badeley; the librarian, Mr. C. T. Clay; the examiner of standing orders, Mr. Edward Vigors, and Lieut.-Col. Sir R. Verney; the gentleman usher of the Black Rod, Lieut.-Gen. Sir William Pulteney; the yeoman usher, Brig.-Gen. Lord Esmé Gordon-Lennox; and the sergeant-at-arms, Maj.-Gen. Sir Charles Edward Cockran. The leader of the House is Viscount Halifax and the Opposition leaders are Lord Snell (Labour) and the Marquess of Crewe (Liberal).

**Massamaquoddy Bay.** This outlet of the St. Croix river lies between Maine and the Canadian Province of New Brunswick. At St. Andrews, the maximum tide, three days a month, is 25ft. and the average head of water is 15 feet. The Recovery Program of President Roosevelt, developed in 1933, included a project estimated to cost \$36,000,000—a somewhat conjectural sum—whereby a series of dams would hold back the incoming and outgoing tides, so creating water-power convertible into electricity. An original grant of \$10,000,000 was reduced to \$7,000,000 and work was begun on the immense undertaking. In August 1936, Congress declined to make further appropriations and the scheme was brought to a standstill. A village called Quoddy for employees had been laid out at a cost exceeding \$1,000,000 and temporary use was made of it as a camp for young men. President Roosevelt prophesied that in days to come, the "project would be sold to the American people." But Dr. Karl T. Compton, president of the Massachusetts Institute of Technology in Oct. 1937, included the scheme among projects which "might have been justified in case of an emergency" but were not "justified solely on engineering grounds." It was argued that there was no local demand for the volume of power expected from the tidal waters and that

a steam plant costing a fraction of the outlay would meet any possible demand.

**Patents.** A number of changes in the patent laws of the world have been effected in the last six years. Some countries have revised and redrafted their patent laws: England (1932); Italy (1934); Canada (1935); Germany and Denmark (1936); and others have made minor changes in their statutes.

Several distinct types of laws exist with respect to the granting of patents for inventions by different countries. The registration system, in which patents are granted on demand without any examination of the subject matter, obtains in France. The United States and Germany are outstanding examples of countries in which a rigid and extensive examination of applications for patents is made and the patent refused if not found novel. Other countries exhibit gradations between these two. In England, the Act of 1932 extended the scope of the former limited examination, so as to approximate more closely that of other countries.

The Latin countries in general follow the registration system, but the comprehensive revision of the patent laws of Italy in 1934 introduced the examination system, although it has not yet become effective.

A fundamental principle in the patent law of the United States has always been the recognition and importance of the inventor, as an individual. The application for patent must be made by the actual inventor, for a valid patent. In Canada also the actual inventor must be the applicant for the patent, and in both countries an oath of inventorship is required. In other countries the applicant for a patent need not be the actual inventor and the patent is ordinarily granted to the first to apply. Recent changes in some countries have laid emphasis on the patent as a reward and recognition of the inventor. Under the German law of 1936 the inventor has the right, capable of enforcement, of being named in the patent as the inventor, in those cases in which he is not himself the patentee. This also is true of the new Italian and Danish patent laws. The London Conference of 1934 for the revision of the International Convention for the Protection of Industrial Property adopted a new article providing that "The inventor has the right to be mentioned as such in the patent."

In most countries the publication or public use of an invention before the date of the application is a bar to the grant of a patent. The hardship of this rule has been mitigated by the new German law, which now provides that publication or use by the inventor, for a period of six months prior to the date of the application shall not constitute a bar to the grant of a patent. Likewise the Italian law of 1934 exempts certain publications for a year prior to the filing date of an application.

The United States and Canada have long provided a period of two years before the right to a patent is lost by publication or use.

Many improvements have been introduced in the administration of the U.S. Patent Office during the last several years. Other modifications of present procedure are in process of formulation. There have been considered also certain amendments of the statutes. After a special investigation, President Roosevelt's Science Advisory Board recommended (1935) the creation of a single Court of Patent Appeals to decide appeals in patent infringement suits now decided by ten different courts.

This recommendation was embodied in a bill on which extensive hearings were held by the Senate Patent Committee in 1937.

In 1936 the centennial of the Patent Act of 1836 was celebrated nationally, with Washington as the focal point. This Act was the first legislation to provide for preliminary compulsory examination of patent applications as to novelty, and for the establishment of a special office manned with examiners for the purpose.

The most recent data and estimates available show that 173,149 patents were granted by all the countries of the world in 1935. The number of patents granted by some countries during this year were: Argentina 1,280; Australia 2,129; Austria 4,000; Belgium 5,961; Canada 8,007; Czechoslovakia 3,200; Denmark 1,380; France 18,000; Germany 16,139; Gt. Britain 17,675; Hungary 2,270; Italy 9,890; Japan 4,766; Netherlands 2,800; Norway 1,260; Poland 1,723; Spain 2,001; Sweden 2,944; Switzerland 7,448; United States 44,944; U.S.S.R. 4,668. In 1937 the United States granted 43,271 patents. The total number of patents granted by all the countries to and including 1937 can be estimated as approximately seven and a half million; however, these do not involve that number of distinct inventions since an invention must be patented in each country to be protected in that country, and numerous inventions are thus patented in a number of different countries.

(C. P. Co.)

**Patton, Raymond Stanton** (1882-1937), naval officer, admiral, director of the U.S. Coast and Geodetic Survey since 1929, was for many years the nation's leading hydrographic engineer. Born in Degraff, Ohio, Dec. 29, 1882, he entered Government coast work immediately upon his graduation from Western Reserve and served without interruption until his death in Washington, Nov. 25, 1937.

**Peace:** see DISARMAMENT; PACIFISM; WARFARE.

**Peaches.** The peach crop in the U.S. in 1937 was 59,626,000 bu., worth \$51,749,000, as compared to a 47,650,000 bu. crop in 1936, worth \$36,883,000. The 1937 crop was nearly 2,500,000 bu. more than the annual average for five years, 57,298,000. These figures are from estimates by the U.S. Department of Agriculture.

In Canada the 1937 crop was estimated at 523,000 bu. by the Ministry of Agriculture. This is an increase of about 30% over the production of 1936.

Following is the production in 1937 in different States in the U.S., with the 1937 income from the crop in each State. The fig-

ures in parentheses give the production in 1936. California, 23,141,000 bu. (21,502,000), \$13,900,000. In California clingstones accounted for 15,407,000 bu. of the crop and freestones, 7,734,000 bushels. Georgia, 2,730,000 bu. (5,589,000), \$3,400,000. Pennsylvania, 2,673,000 bu. (799,000), \$2,100,000. Michigan, 2,652,000 bu. (1,720,000), \$2,375,000. Illinois, 2,117,000 bu. (256,000), \$2,150,000. North Carolina, 1,984,000 bu. (1,558,000), \$2,350,000. Tennessee, 1,860,000 bu. (854,000), \$1,350,000. New York, 1,806,000 bu. (1,232,000), \$1,675,000. Missouri, 1,728,000 bu. (107,000), \$1,050,000. New Jersey, 1,651,000 bu. (1,352,000), \$1,575,000. Virginia, 1,599,000 bu. (594,000), \$1,350,000. Texas, 1,392,000 bu. (1,156,000), \$1,050,000. Ohio, 1,296,000 bu. (169,000), \$1,375,000. Oklahoma, 1,073,000 bu. (20,000), \$750,000. Alabama, 990,000 bu. (1,720,000), \$650,000. Washington, 935,000 bu. (1,558,000), \$825,000. West Virginia, 528,000 bu. (90,000), \$425,000. Mississippi, 474,000 bu. (1,052,000), \$275,000. Maryland, 448,000 bu. (279,000), \$425,000. Indiana, 402,000 bu. (10,000), \$250,000. Delaware, 398,000 bu. (500,000), \$375,000. Louisiana, 269,000 bu. (378,000), \$170,000. Kansas, 256,000 bu. (18,000), \$80,000. Oregon, 241,000 bu. (258,000), \$250,000. Connecticut, 177,000 bu. (176,000), \$235,000. Massachusetts, 107,000 bu. (105,000), \$145,000. (S. O. R.)

**Pears.** Increased production of pears in 1937 was reported by British Columbia, Nova Scotia, and the United States. British Columbia harvested a crop estimated by the Ministry of Trade and Commerce at 277,100 boxes, compared to 267,300 boxes in 1936. In Nova Scotia the crop was estimated at 18,000 bu., 8,000 bu. larger than 1936 production, while in the United States the 1937 crop was the largest on record and was estimated by the U.S. Department of Agriculture as 30,139,000 bushels. This was 12% larger than the 1936 crop of 26,956,000 bu. and 24% higher than the five-year (1928-32) average of 24,344,000 bushels. In Ontario production declined from 196,800 bu. in 1936 to 157,400 bu. in 1937. The crop in Germany was estimated by the International Institute of Agriculture as 20,260,000 bu., slightly lower than average production. Smaller crops in 1937 were reported by the Institute for Belgium, Switzerland, Italy, the Netherlands, Denmark, Czechoslovakia, Hungary, and the Union of South Africa, and larger production in Sweden, Norway, Austria, and Bulgaria. France reported a larger crop of bartlettts, but smaller production for the late varieties. In the Pacific Northwest of the United States the bartlett crop was reduced by blight injury and scab damage, but late varieties yielded heavily. Production in most of the States was above average. About 30% more of the crop was in cold storage in Dec. 1937, than at the same time in 1936. The 1936-37 exports marked almost a record in pear shipments from the United States. In the eleven months from July 1, 1936, to May 31, 1937, 1,064,000 bu. were exported to the United Kingdom, 559,000 bu. to Canada, 392,000 bu. to France, 120,000 bu. to Sweden, 105,000 bu. to Brazil, 51,000 bu. to Egypt, 41,000 bu. to Palestine, and 20,000 bu. each to Cuba, Belgium, and Finland. (S. O. R.)

## Peel, William Robert Wellesley Peel,

1ST EARL (1867-1937), P.C., G.C.S.I., G.B.E., British statesman born Jan. 7. He was educated at Harrow and Balliol college Oxford, and was called to the bar at the Middle Temple in 1893. In parliament, as a Unionist, he represented South Manchester 1900-06, and Taunton, 1909-12. In 1912 he succeeded his father as 2nd Viscount Peel. He was chancellor of the Duchy of Lancaster and minister of transport, 1921-22; secretary of state for India, 1922-24 and 1928-29; first commissioner of works, 1924-28; and lord privy seal, 1931. He was a member

1930-31, of the Indian round table conference; chairman, 1931-32, of the Burma round table conference; and member of the Indian joint committee, 1933. His most recent task, and one of his most onerous, was performed as chairman of the Palestine royal commission, 1936-37. Lord Peel was created an earl in 1929, in which year he was also created Viscount Clanfield of Clanfield. He was appointed to the privy council in 1920, and was created G.B.E. in 1919 and G.C.S.I. in 1932. He died Sept. 8, 1937. His son succeeds him as 2nd earl.

**Peiping** (PEKING), the most famous and architecturally beautiful city of China, the capital of the Chinese Empire from about 1267 to 1368 and again from 1421 until the fall of the Manchu dynasty in 1911, and of the Chinese Republic from 1911 until 1928. It was captured in 1928 by the armies of the Chinese Nationalist Government, which had established its capital in Nanking, and was renamed Peiping (Northern Peace), the name which it bore under the early Ming emperors. It was occupied by the Japanese in the summer of 1937 (see CHINESE-JAPANESE WAR) and the Peace Maintenance Commission which was set up restored the old name of the city, Peking, in the fall. Peiping, or Peking, became the seat of a régime which was set up under Wang Ko-min and Tang Er-ho with Japanese sympathy and support and which claimed to exercise authority over North China under the name of the Provisional Government of China. Population (1936), 1,560,000. The city is separated by 90 mi. of level agricultural country from the coast of the Gulf of Pechihli. The climate shows the influence of the neighbouring Gobi desert, with hot summers, cold winters, and occasional dust storms. Of all the Chinese larger cities (Shanghai, Tientsin, Canton, Hankow), it is the least developed industrially, being without large factories. But it is a notable centre of the Chinese arts and handicrafts and until 1937 occupied a very important place in Chinese intellectual life. There were more than 50,000 Chinese students of all grades in Peiping before the outbreak of Sino-Japanese hostilities in the summer of 1937 caused a serious setback to intellectual life. All the Chinese universities in the city were closed, the premises in some cases being occupied by Japanese troops; and only Yenching university (founded and supported by American missionary contributions) and two other institutions of higher learning in which there was a foreign interest found it possible to carry on work during the first months of the Japanese occupation. It is still too early to predict whether this blow to Peiping's significance as an intellectual centre will be permanent. Many professors and scholars with nationalist views have found it expedient to leave the city. Peiping is the seat of the most elaborate and impressive medical undertaking in the Far East, the hospital and medical school equipped by the Rockefeller Foundation. The city is extraordinarily rich in the monuments of the Chinese imperial past. Among the most famous of these are the Temple of Heaven, the Summer Palace, the Winter Palace, the Lama Temple, the Temple of Confucius, and the Bell Tower. A small part of the city is walled off as the Legation Quarter, where foreign embassies and legations are located and where the signatory Powers of the Boxer Protocol (with the exception of Russia, Germany, and Austria) possess the treaty right to maintain troops. Most foreign powers have also opened diplomatic missions in the new Chinese capital, Nanking, but the whole future of foreign diplomatic representation in China is uncertain as a result of the course of Sino-Japanese hostilities.

**BIBLIOGRAPHY.**—Bredon, *Peking* (1922), Gamble, *Peking: A Social Survey* (1921).

**pellagra:** see DIETETICS.

**Permba:** see ZANZIBAR.

**Pennsylvania**, one of the original States of the United States, popularly known as the "Keystone State," area, 45,126 sq.mi. (294 sq.mi. water); population (U.S. census, 1930) 9,631,350; (estimate, July 1, 1937), 10,176,000. Capital, Harrisburg, 80,339.

Cities with a larger population in 1930 were Philadelphia, 1,950,961; Pittsburgh, 669,817; Scranton, 143,433; Erie, 115,967; Reading, 111,171; Allentown, 92,563; Wilkes-Barre, 86,626; and Altoona, 82,054. Of the State's population 6,533,511 were urban, or 67.8%; 7,959,551 native white; 1,233,051 foreign-born; and 431,257 Negro.

**History.**—The first Pennsylvania legislature to be controlled by Democrats in over ninety years met early in 1937, and pre-

GEORGE HOWARD EARLE III, governor of Pennsylvania

sented the Governor with 137 bills of which 17 were vetoed. Those approved featured labour legislation. Thus one act provided for a 44-hour week excepting only domestics, agricultural workers, and adults receiving more than \$25 a week in executive positions or the learned professions. A second measure established a labour relations board, limited the use of injunctions in labour disputes, and upheld the right of organization. Still another bill provided minimum wages for women and minors exempting only newsboys, domestic help, and agricultural workers. These statutes were intended to prevent repetition of the serious situation resulting from strikes during the year at Hershey, Bellefont, and Johnstown. Other labour provisions included bills requiring full railroad crews and regulating industrial work in homes.

The most perplexing problem faced by the legislators was the bootlegging of coal from abandoned mines. The illegal seizure of coal had reached such proportions by the first of the year that Federal intervention seemed imminent. This was forestalled by the establishment of a State commission to study the problem and inaugurate plans for State regulation in event of continued difficulty. Leasing or purchase of inoperative mines by either the State or distressed miners was seriously discussed; the situation being slightly eased when New York city legislated against sales of bootleg coal. At the end of the year, the proper solution was still being seriously debated.

Other measures of significance included a bill reorganizing relief administration by abolishing local poor boards and establishing a State Board of Public Assistance to operate through two city and 66 county districts; provision for a toll highway between Harrisburg and Pittsburgh; and an act granting the State wide powers of liquor control.

Of five constitutional amendments submitted to the voters in November, only that legalizing pensions to mothers and to the blind was approved. The electorate refused to uphold introduction of a State income and inheritance tax despite the Governor's plea that such funds would be used to lighten the burden of local school support. The voters likewise rejected consolidation of the Philadelphia city and county governments, although even the Republican city chairman supported the administration's proposal. Also defeated were an amendment for the issue of \$42,000,000 in bonds for State institutions and one which would have permitted an annual submission of constitutional amendments instead of at the prescribed five-year interval. The amendments were voted

upon only after court decisions upheld their submission. Whether such sanction will be given amendments adopted by the 1937 legislature for county consolidation, \$50,000,000 for State roads, and exemption of local revenue producing bonds from debt limits is problematical.

The leading officials are: governor, George H. Earle; lieutenant-governor, Thomas Kennedy; treasurer, Charles A. Waters; attorney-general, C. J. Margiotti; chief justice, J. W. Kephart.

**Education.**—Pennsylvania contains over 50 colleges and universities. During 1936 there were 10,768 public elementary schools with 1,367,377 pupils and 38,987 teachers and 1,234 high schools with 613,478 pupils and 20,332 teachers.

**Banking and Finance.**—On June 30, 1936, Pennsylvania had 1,139 banks (429 State and 710 national) with a capital of \$328,671,000, deposits of \$4,873,754,000, and total resources of \$6,052,379,000. For the fiscal year ending May 31, 1937, the State Treasury reported receipts of \$304,930,895 which with expenditures of \$295,297,462 and previous balances left a balance of \$10,982,320. On the same day the State debt stood at \$122,442,000.

For 1937-39 the legislature voted a budget of \$355,791,086 including relief appropriations of \$137,000,000. To meet these expenses, a normal tax income of \$162,005,206 and emergency taxes of \$186,630,000 were expected with \$156,145,105 coming from motor licence, gasoline and other earmarked funds. Regular taxes were levied on real property valued at over \$9,000,000 and personal property assessed at more than \$2,500,000. Emergency taxes extended by the legislature were a four mill tax on personal property, a one cent tax on gasoline for relief purposes, taxes on cigarettes, liquor sales, bank shares and public utilities. An emergency tax on corporation incomes was continued but reduced from 10% to 7%. The legislature also adopted a chain store tax, but collection must await court decisions.

An extensive building program was inaugurated early in the year when the State Supreme Court upheld the creation of a State building authority by the 1935 legislature. The project provides for construction projects valued at \$56,190,000, one-half of which will be spent for State hospitals, one-quarter for educational institutions, and over \$5,000,000 for a State finance building. The Federal Government will pay \$20,000,000 of the expense and will loan up to \$50,000,000 at 4%.

**Agriculture, Manufactures, Mineral Production.**—According to the 1935 agricultural census, Pennsylvania possessed 191,284 farms of 15,855,343 acres with land and buildings valued at \$861,706,599, a crop production of \$68,839,000 and live stock and live stock products worth \$163,951,000. During 1936 the leading crops of the State were 54,572,000bu. of corn worth \$55,117,720; 2,470,000 short tons of hay, \$35,321,000; 26,268,000bu. of potatoes, \$30,208,200; 19,615,000bu. of wheat, \$19,801,150; and 24,009,000bu. of oats, \$12,244,590.

Recent statistics reveal that in 1935 Pennsylvania was surpassed only by New York in industrial activity with 13,050 establishments employing 841,234 workers and having an output valued at \$4,291,847,924. The leading products in order of value were: steel works (\$575,915,179); petroleum refining (\$204,465,575); knit goods (\$174,171,093); printing and publishing (\$171,678,643); electrical machinery (\$134,415,923); men's clothing (\$132,534,781); bread and other bakery products (\$129,066,111); and meat packing (\$100,453,515).

Statistics covering U.S. mineral production during 1935 show a Pennsylvania output of \$520,575,611, placing the State close to Texas and far ahead of all others. The product responsible for Pennsylvania's leading position was coal valued at \$382,300,565, of which \$210,130,565 was anthracite. Other important items were natural gas, \$39,434,000; petroleum, \$33,840,000;

cement, \$21,080,596. Not listed in the State's production total because of the employment of materials from outside Pennsylvania was the pig iron output valued at \$102,027,692.

In May 1936 there were 38,032mi. of State highways of which more than 27,750mi. were surfaced. Of the total mileage, 23,392 were rural roads under State control. During the year motor registration approached 2,000,000 and licences issued exceeded that figure. Of 13,206,000ac. of forest, 1,649,439 were controlled by the State.

**Pennsylvania, University of.** The University of Pennsylvania opened its 1937-38 session with an enrolment of approximately 15,810 and a faculty of approximately 1,428. In 1937 the university inaugurated a bicentennial campaign to increase its material resources as the means of celebrating in 1940 the two hundredth anniversary of its founding. Over \$2,000,000 had been realized through this effort by the end of the year.

The university museum conducted, during the year 1937, expeditions in Persia, Mesopotamia, Cyprus, Africa, Guatemala and the United States. The Wharton school of business administration established an Institute of Local and State Government because of the general neglect of this aspect of government, and to arouse a greater student interest in the duties of citizenship. The courses in chemical, civil, mechanical, and electrical engineering were accredited by the Engineers' Council for Professional Development. As a prerequisite for admission, the veterinary school required one year of college work. The school received through the family of the late Effingham B. Morris a farm for the study of animal pathology, for the support of which the legislature appropriated \$100,000. The 13 separate schools with the affiliated divisions continued to bring together for the common good and public need the abilities of the entire staff. Progress was noted in medical and other departments of research.

**Perin, Charles Page** (1861-1937), American metallurgical engineer who as president of the Niagara Electrolytic Iron Company built one of the first plants in the United States for the manufacture of pure iron by electrolysis. Born at West Point, N.Y., Aug. 23, 1861, he was graduated from Harvard university in 1883 and later studied at the École des Mines in Paris. During his early career he was connected with the Carnegie Steel Company as a blast furnace superintendent. During 1905-06 he built the industrial towns of Keokee and Imboden, Va., where he operated large coke plants; and about 1908 he built the model town of Jamshedpur, India. He made a study of the fuel supply of the Trans-Siberian Railroad for the Russian Government in 1901 and was consulted 30 years later by the Soviet Government in connection with the development of its steel industry. He was also retained as consulting engineer by both the Lung Yen Mining Corporation of China and the Japanese Government. He was a past president of the American Institute of Consulting Engineers and the American Iron and Steel Institute and in 1919 was chief engineer of the appraisal committee attached to the Peace Commission. He died in New York city on Feb. 16, 1937.

**Perkins, Osgood** (1892–1937), leading American actor, was born at West Newton, Mass., May 6, 1892. Following his graduation from Harvard University in 1914, he studied the violin for nine years. It was not until 1924 that he scored an immediate hit in his first Broadway appearance in *Beggar on Horseback*. From that time he was in constant demand because of his versatility. Of the plays in which he appeared, *The Front Page* (1928–29), *Uncle Vanya* (1930), *Goodbye Again* (1932), *The School for Husbands* (1932), *Ceiling Zero* (1935), and *The End of Summer* (1936) were among the most successful. He also appeared occasionally in screen productions. He was first vice-president of the Actors Equity Association, of which he had been a councillor since 1926. His death occurred on Sept. 21, 1937 in Washington, D.C., following the opening night performance of a new play.

## Permanent Court of International Justice.

In May 1937, M. Charles de Visscher (Belgium) was elected to the seat vacated by the death of Baron Rolin-Jaequemyns (Belgium), but the vacancy left by the death of M. A. Hammarskjöld (Sweden) in July was not filled. At the end of the year the court was composed as follows: M. Guerrero Salvador, *president*; Sir Cecil Hurst (United Kingdom), *vice-president*; Count Rostworowski (Poland), M. Fromageot (France), M. de Bustamante (Cuba), M. Altamira (Spain), M. Anzilotti (Italy), M. Urrutia (Colombia), M. Negulesco (Rumania), Jonkheer van Eysinga (Netherlands), M. Nagoaka (Japan), M. Cheng Tien-hsi (China), Mr. Manley O. Hudson (U.S.A.), M. de Visscher (Belgium).

On April 26, Monaco, by signing the optional clause, brought up to 41 the number of states bound by it.

Three judgments were handed down by the court during the year:

(i) *Case between Belgium and the Netherlands regarding the diversion of waters from the river Meuse*.—On Aug. 1, 1936, the Netherlands instituted proceedings against Belgium under the optional clause on the ground that certain works by Belgium in connection with the construction of the Albert canal (Liège to Antwerp) and the manner of supplying with water certain canals to the north of the country were inconsistent with the treaty of May 12, 1863, concerning the régime for taking water from the river Meuse. The Belgian Government, in a counter-claim, held that the Netherlands, by constructing the Borgharen barrage and the Juliana canal (Maestricht to Maasbracht), had committed a breach of the same treaty. On June 28, 1937, by ten votes to three, the court rejected both the submissions of the Netherlands and the Belgian Government's counter-claim.

(ii) *Case between France and Greece concerning lighthouses in Crete and Samos*.—On March 17, 1934, the court handed down a judgment, whereby it decided the principle that the contract of April 1913 between a French firm and the Ottoman Government, extending from Sept. 1924 to Sept. 1949, concession contracts granted to the said firm, was duly entered into and was operative regarding the Greek Government "in so far as concerns lighthouses situated in the territories assigned to it after the Balkan wars or subsequently." The court, however, added the reservation that it was "not called upon to specify which are the territories where lighthouses in regard to which the contract of 1913 is operative are situated." After discussions, the Greek and French governments, on Aug. 28, 1936, signed a special agreement asking the court for judgment regarding the applicability of the principle laid down in March 1934 to lighthouses in Samos and Crete. Judgment was rendered by the court on Oct. 8, 1937, whereby it was decided by ten votes to three that the lighthouses in Samos

and Crete were covered by the contract of 1913.

(iii) *Case between Belgian and Spanish Governments as to whether the responsibility of the Spanish Government was involved in regard to the death of Baron Jacques de Borchgrave*.—The case was submitted by a special agreement of Feb. 20, 1937, between the two governments. On Nov. 6, 1937, the court rendered judgment overruling unanimously the preliminary objections of the Spanish Government and fixing the time-limits for the continuation of the written proceedings on the merits. At the end of the year two cases were pending, the *Moroccan Phosphates Case* between France and Italy, submitted by Italy in March 1936, and the *Panevezys-Saldutiskis Railway Case* between Estonia and Lithuania, submitted by Estonia in Nov. 1937.

(S. A. HE.)

**Persia:** see IRAN.

**Peru**, a republic on the West Coast of South America; language, Spanish; capital, Lima; president, Gen. Oscar R. Benavides. The area is 532,185sq.mi., including approximately 100,000sq.mi. in dispute with Ecuador. In July 1937, the first official census since 1876 was begun. Population (estimated, 1935) 6,791,914. The principal cities, with estimated populations, are: Lima, 281,000; Callao, 75,000; Arequipa, 70,000; Cuzco, 40,000.

**History.**—Government is by decree in the absence of regular congressional sessions and is controlled by the president-dictator, General Benavides. In 1937, Peru continued the steady economic improvement manifested since 1932, a condition due largely to the increased production of gold and cotton. The chief disturbing factors were the continued agitation by members of the proscribed Apra party, which resulted in disorders and arrests, and the uncertainties attending the efforts to settle the boundary dispute with Ecuador. Negotiations for amicable adjustment of the controversy were started in Washington in September 1936, with an agreement to accept United States arbitration in the event of failure. Friction along the frontier was acute in June, with the dictators of the disputant countries unwilling to make concessions lest they be capitalized upon by opposing factions. The crisis passed, but the year closed with no definite progress in the negotiations.

**Education.**—In 1936 there were 3,802 elementary and 45 secondary schools, with a total enrolment of approximately 525,000. The budget allotted 10% to education. Higher education is provided by technical schools and by the University of San Marcos (Lima), the oldest in America.

**Trade and Communications.**—Regular steamship service and five different airlines provide Peru with adequate external communication. There are over 2,600mi. of railways (about 70% Government-owned), and approximately 13,000mi. of highways mostly improved. Around 13% (\$5,000,000) of the national expenditure went to highways in 1936. Peruvian foreign trade regularly shows a favourable trade balance, offset, however, by the extensive foreign investment in the country. Imports (principally foodstuffs and manufactured articles) totalled 193,500,000 soles in 1936, with the United States the leading source (33%), followed by Germany and Great Britain. Exports (largely petroleum products, sugar, and minerals) totalled 335,800,000 soles, with 22% to Great Britain, 21% to the United States and 11% to Germany. The value of imports from and exports to the United States increased 24% and 67% respectively in the first nine months of 1937, representing a substantial increase in the United States' share of the foreign trade.

**Agriculture and Mining.**—Peruvian industry, with the exception of sugar, is primarily in foreign hands; foreign investment

is estimated at over \$400,000,000, of which nearly half is United States capital, over one-third British, and much of the balance German and Japanese. United States interests own the valuable mines and smelters and British control 80% of the oil, while Japanese are prominent in the rapidly-expanding cotton production. In addition, 24% of the sugar output is United States-owned. Agricultural production, estimated at \$100,000,000 annually, accounts for half the national income, with cotton, sugar, rice, and wheat the leading items. Petroleum output in 1936 was valued at 133,000,000 soles, with silver 36,000,000 soles, copper 27,000,000 soles, and gold 21,000,000 soles. Vanadium and tungsten are also important.

**Finances.**—The monetary unit is the sol (value: 24.5¢ in U.S.). The national budget in 1936 was \$34,478,633.25.

(L. W. BE.)

**Pests, Agricultural:** *see* ENTOMOLOGY.

**Petrol:** *see* GASOLINE; PETROLEUM.

**Petroleum.** World production of petroleum (crude oil) during 1937 will undoubtedly reach a new high, mainly because of a substantial increase in United States output. Soviet Russia, Venezuela, Iran (Persia) and Bahrein island (Persian gulf) are among the other countries which will show greater output when final figures become available.

In all countries largely dependent on outside sources for oil, such as England, France, Germany, Italy and Japan—every effort has been made to stimulate home production. Increasing use of the motor car in these countries has largely resulted in increased imports. Great Britain is consuming 78,900,000bbls. of petroleum products compared with 59,000,000bbls. in 1932; France, 42,000,000bbls. against 33,500,000bbls.; Germany 37,000,000bbls. against 21,000,000bbls.; Italy 19,900,000bbls. against 10,370,000bbls.; Japan 28,000,000bbls. against 14,000,000bbls. in 1932.

England and France, with American interests, have successfully developed Iraq production in the Kirkuk field which is taken by pipe line to the Mediterranean through the Franco-Syrian town of Tripoli and branches at Haditha to the port of Haifa, under British mandate. British petroleum policy has had further success in Arabia, in Hejaz and in Yemen. Production by American interests at Bahrein island (under British protectorate) has increased. Japan has managed to boost Formosa production, as well as output from North Sakhalin, leased from Soviet Russia.

Following decline of the Grozni field and the old oil fields of Baku, Russia has succeeded in making large extensions of producing territory in Grozni, Baku and Maikop, largely through replacement of old freefall and cable drilling methods by American rotary drilling methods and by means of deeper drilling. Utchkezel and Handay, in Middle Asia, is yielding increasing oil. New oil zones are promised in the Turcoman republic, while Crimean oil properties show promise.

The estimated crude oil production in the United States for 1937 is 1,275,000,000bbls. against 1,098,516,000bbls. in 1936, a new high record reflecting increased demand for petroleum products, particularly for gasoline (*see* GASOLINE), as the recovery from the depression gained impetus through the early months of the year. While production of oil in the United States is restricted by State conservation laws, supported by the Interstate Oil Compact and the Federal Connally Act forbidding interstate transportation of "hot oil"—petroleum produced in violation of State production quotas—the year saw one of the most active drilling campaigns in the history of the industry. In Texas, Oklahoma and Kansas, and beyond the Rockies in California, geologists carried on unusual searches for favourable prospects. It appears that the 26,000 new wells of 1936 will be exceeded by 6,000 and will

closely approach the all-time record activity established in 1920.

Despite the heavy drain on American oil fields, which have produced 20,000,000,000bbls. of oil since 1857, 64% of total world production, the United States continues to be in a satisfactory situation as to petroleum reserves. Such fields as East Texas, Yates, Winkler, Conroe and Van in Texas, the Seminole, Oklahoma City and Fitts areas in Oklahoma, Kettleman hills in California and the fields of Michigan and Central Illinois have kept the reserve figure from diminishing. Total reserves as of Jan. 1, 1937, were estimated by the American Petroleum Institute Committee on reserves at 13,063,000,000 barrels.

Due to restriction of individual well production and more effi-

PETROLEUM: Source, by States, of the 1,098,516,000 barrels produced in the United States in 1936

cient utilization of the natural reservoir energy such as gas and water to promote greater ultimate recovery, the actual average per well production has increased from 2,400bbls. per annum in 1926 to 3,110bbls. per annum in 1936. Experts say that ample reserves remain in sight at familiar depths of 3,000 to 5,000ft. to take care of the world's needs for some years to come but that has not stopped deep well exploration. With an eye to the distant future, the American industry has been going ahead quietly, probing deeper and deeper, studying formations, perfecting deep drilling technique, and sometimes finding oil. The search for petroleum two miles down and more has been carried forward in widely scattered areas. Texas boasts the deepest well in the world—12,786 feet. Louisiana has the deepest producer in the Lirette field, completed in 1936 at a depth of 11,619 feet. California has a number of deep wells, including one in the Kettleman hills field producing at 10,735ft. which was completed in 1937. Mexico drilled a test well of 10,000ft., Rumania one of 11,000ft., and Iran has one deeper than 10,000 feet. An illustration of the possibilities of deep well drilling is given in the La Fitte field in Louisiana where it is estimated that the wells around 10,000ft. deep have established total oil reserves of 35,000,000 barrels.

Probably the most important development in the American industry is the achievement of greater stability. Until recent years, efforts to approximate an equality between supply and demand were more or less unsatisfactory; it was feast or famine. Within the last few years, the U.S. Bureau of Mines with increasing accuracy has predicted the future demand for petroleum and its

products and recommended production quotas to the regulatory bodies of the several producing States. These quotas are put into effect. The policy has practically halted periodic over-supply which formerly resulted in excess storage above ground and its attendant waste. Oil not required for current consumption and reasonable working stocks is permitted to remain stored in its natural reservoir which, in turn, contributes to the more efficient extraction by conserving the natural reservoir energy.

With the growth of conservation principles, there have come increasing limitations upon, and exceptions to, the rule of oil capture. Today an owner or lessee cannot drill without the permit of a regulatory body; locate a well except as the applicable spacing rule or exception specifies; penetrate surface water sands without adequate subsequent protective casing; complete a well without a proper casing program and suitable means for shutting off extraneous water; produce a well except through tubing with restricted flow; utilize gas in reservoir as a lifting agency beyond a permitted gas-oil ratio; currently produce in excess of established allowable production; create fire hazards or waste oil by use of earthen storage; transport oil by pipe line without a pipe line permit; dispose of salt water without prevention of pollution; or abandon a well without proper plugging. In these and many other ways he must subordinate his hitherto unrestricted right of capture to the public policy of the state.

There has been a distinct trend toward wider and more uniform well spacing. Increasing improvement in petroleum technology and associated sciences having to do with reservoir energy and efficient use of natural gas in producing oil has kept pace with equipment and drilling methods permitting much deeper exploration. By the employment of geophysical methods such as the torsion balance, seismograph, magnetometer and gravimeter, oil exploration has widened, lengthened and deepened. Largely due to their use in the last 15 years, the deep well's stature has changed from 5,000 to 12,000 ft., and the sub-surface horizons of the future are no longer delimited. At the present time it is estimated that about 75% of the new major pools are being discovered by geophysical methods.

In the American industry further significant advances have been made in refining processes, particularly polymerization (*see GASOLINE*). This process is the most important since the cracking process of which it is the product. Without benefit of cracking, the gasoline demand since 1920 could not have been satisfied without a 60% increase in the total of the crude oil that has actually been produced. Polymerization processes have been producing large quantities of gasoline from refinery gas and natural gas. Hydrogenation is another process past the experimental stage and in reserve for the future. It provides for making gasoline from the heaviest residues. In earlier days the refiner's cuts of crude oil designed to satisfy demand for one product resulted in

overproduction of others. Now the refiner is more nearly approaching the flexible position of making the products desired in the proportions desired.

The past year has been noteworthy for the "coming of age" of the petroleum chemical industry. Researches carried on since 1927 by the American Petroleum Institute, the U.S. Bureau of Standards and the petroleum companies have resulted in determining the identity and approximate amount of the significant hydrocarbons actually in petroleum, in the development of processes of fractionation which can be used economically on a commercial scale to effect the separation of wanted hydrocarbons and in the accumulation of information on the chemical, thermodynamic and kinetic constants of hydrocarbons and their derivatives. The petroleum chemical industry is now successfully making a host of chemical products. The wresting from nature of knowledge of the chemical constitution of petroleum is one of the most important developments in the history of the industry. The world's dependence on petroleum continues to increase and the importance of petroleum sources of supply becomes more pronounced as industrial development progresses. Moreover, as nations arm and as wars are fought today in the air and with mechanized land equipment and with ships oil-fueled or Diesel-engined, oil must be had for national defence. More than 1,750,000,000 bbls. of petroleum products are consumed annually throughout the world. Gasoline runs 40,000,000 motor vehicles, as well as planes, tractors, stationary engines and other power plants, the world requiring 675,000,000 bbls. annually. For industrial and domestic purposes and on ships the world consumes more than 700,000,000 bbls. of fuel oil annually. Other major products of petroleum required by the world are lubricants, utilized wherever and whenever machinery operates; and kerosene, illuminating millions of homes. (*See also GASOLINE; MEXICO: History.*)

(L. M. F.)

**Philadelphia**, third largest city of the United States, conducted in 1937 a celebration of the 150th anniversary of the signing of the Constitution of the United States, which was continued over a period of 112 days (May 10 to September 17). Several dramatic strikes; the Grand Jury probe of gambling and police; a vain attempt to reorganize the transit company; and the also unsuccessful effort of Mayor S. Davis Wilson to obtain city administration of the municipal gas works, which for 30 years have been leased to the United Gas Improvement Company, were outstanding features of the year.

Mr. Wilson had been elected mayor on a pledge to bring "fifty cent gas, and five cent car fares," both of which programs have been declared unfeasible. The gas lease expired December 31, but after months of hearings, and discussion of plans, the city council, on December 17, voted to renew it. On December 29, the mayor vetoed the ordinance, and the same day the Council passed the lease over his veto. The mayor announced the lease was contrary to the provisions of the city charter, and was unfair. On December 30, a taxpayer's suit was filed to enjoin the mayor and council from putting the lease into effect.

In January, 1937, a Joint Legislative Committee began investigation of the city-county government of the city, and reported favouring the abolishment of the Municipal Court and other changes, and was authorized to continue until the next session of the Assembly. At the election in November voters defeated amendments to the State Constitution, which would permit the consolidation of city and county governments in Philadelphia. On September 15, District Attorney Charles F. Kelley asked Judge Curtis Bok for a Grand Jury investigation of gambling and police. Five alleged operators of gambling houses so far have been indicted. The investigation continues.

WORLD PRODUCTION OF CRUDE PETROLEUM in 1936: total, 1,810,229,950 million barrels

The Works School Survey, in a report given out in September, recommended drastic changes in the school system in Philadelphia, including the abandonment of the Normal school. In October, Mayor and Mrs. Wilson began a taxpayers' suit against the Board of Education to test that body's constitutional right to the power of taxation. The court ordered that the board should not impose a greater tax than 85¢ on each \$100 assessed value; the board took an appeal.

On May 6, 5,000 union hosiery workers took possession of the Apex hosiery plant, and on June 23, the mayor led 256 of them out of the building. The strike ended a month later. There were two city-wide strikes of truck drivers; the first on July 2, which paralyzed the city and prevented the issuance of the morning papers on July 3. A second strike was begun on August 2. On August 4, the mayor declared "a state of emergency" existed, which had the effect of ending the disorder, five hours later.

(J. JAC.)

**Philately.** A conservative survey of the year just past does not disclose any great changes in the philatelic pattern of the world. The hobby continues to interest an ever-increasing number of collectors with, of course, the greatest activity being noted in England, the Continent and the United States. Much enthusiasm has been noted in South Africa, Australia and New Zealand where important exhibitions have been held. Several prominent collections have been disposed of by auction both in England and the United States where the items offered found a ready market at surprisingly high prices. Outstanding rarities have continued to increase in value whenever offered for sale. A definite trend toward collecting foreign stamps has developed in the United States and throughout the world generally collecting along serious lines as opposed to merely filling spaces in printed albums is finding favour. The total number of stamps listed in the major catalogues for 1937 approximates 2,000—slightly more than for the previous year.

Three major stamp issuing events are noted for the year, the first of which occurred in May when Great Britain issued throughout the Empire stamps to commemorate the coronation of King George VI and Queen Elizabeth. This series which totalled 202 stamps (three each for the 45 Colonies and 67 for Great Britain and the Dominions), had long been awaited by philatelists and the advance orders reached tremendous proportions as speculators sought to repeat the profits made on the Silver Jubilee series of 1935.

The second is a direct outgrowth of the war in Spain which has resulted in the philatelic world being flooded with an avalanche of stamps purported to have been issued by the governments of

both warring factions. The authenticity of many of these stamps was questioned by philatelists, it being generally conceded that at least some of them were not authorized. The number of stamps issued assumed such alarming proportions—there being more than 1,000 reported—that editors of the great catalogues of the world abstained from listing the stamps until such time as authoritative information can be gathered.

The third, and in many ways the most interesting event has been the promotion of miniature or "souvenir" sheet collecting. This type of commemorative stamp consists of a block of four or a pair, or even a single stamp printed in the centre of a small-sized sheet of paper bearing appropriate inscription of the event commemorated. Sometimes the stamps are of special designs, more often they are in the same design as a regularly issued stamp printed in a different or even in the normal colour. In 1926, and on various other occasions, the United States prepared "miniature" sheets in compliment to philatelic exhibitions. The idea had long been used by various philatelic exhibitions in Europe as a means of obtaining revenue to promote the exhibitions. Usually the sheets were only obtainable at the expositions themselves and their sale limited to one set with each ticket of admission. Seized upon during the last year and exploited by operators of philatelic exhibitions, and more recently by governments themselves as a means of obtaining additional revenues, souvenir sheets achieved an enormous popularity. The exploiters behind the newer emissions, however, seem to have overstepped themselves by charging excessive premiums over the face values of the stamps and in so doing have incurred the wrath of the philatelic press. In fact, the leading catalogue of Great Britain (Gibbon's) has refused to list, with few exceptions, more of these issues; and the Scott catalogue in the U.S.A. has limited their listing to notations under a special department known as "Tentative Listings." (P. H. T.)

The U.S. Post Office Department issued during 1937 to the nation's postmasters 15,108,639,409 stamps in the following denominations and numbers: One-half cent, 343,241,600. One cent, 2,796,181,210. One and one-half cent, 1,320,354,600. Two cent, 2,913,355,640. Three cent, 6,276,015,970. Four cent, 109,745,100. Five cent, 245,141,000. Six cent, 247,275,650. Seven cent, 44,469,500. Eight cent, 90,906,450. Nine cent, 97,666,800. Ten cent, 227,211,750. Eleven cent, 48,509,000. Twelve cent, 46,481,000. Thirteen cent, 21,688,900. Fourteen cent, 14,699,900. Fifteen cent, 68,447,250. Sixteen cent, 7,289,900. Seventeen cent, 27,732,200. Twenty cent, 98,887,400. Twenty-five cent, 18,687,450. Thirty cent, 20,944,100. Fifty cent, 20,582,710. One dollar, 2,746,439. Two dollar, 238,200. Five dollar, 179,690.

## Philippines, Commonwealth of the.

The Philippine Islands south-east of China, entirely in the tropics; capital, Manila; U.S. high commissioner, Paul V. McNutt; president, Manuel Quezon; vice president, Sergio Osmeña; status in 1937 that of an unincorporated territory, until July 4, 1946 under constitution provided in the Tydings-McDuffie Independence Act; national assembly, unicameral. During the period of the commonwealth, all legislation affecting currency, coinage, imports, exports, and immigration requires approval of the President of the United States; the U.S. is in control of foreign affairs; and all decisions of local courts are subject to review by the U.S. Supreme Court. Area, approximately, 114,400 sq.mi.; population (estimate) over 14,000,000 (13,099,405 by 1935 estimate); basic stock, Malayan, but many blends and mixtures exist. Chinese number about 75,000 and Japanese, about 20,000.

**History.**—The constitution of the commonwealth was adopted Feb. 2, 1935; the first election was held Sept. 17. The plebiscite on woman suffrage, required by the constitution, held on April

BRITISH CORONATION STAMPS. Upper left, Great Britain; upper right, New Zealand (each Dominion issued its own designs which varied greatly); lower left, design used by 45 Crown Colonies; SPANISH REVOLUTIONARY STAMP, lower right

AUSSTELLUNG

DANZIG—a souvenir sheet

so, 1937, resulted in affirmative vote of 447,681 as against negative vote of 44,307—all women. A joint committee of Americans and Filipinos met in Washington and later in Manila to discuss trade and economic conditions and to hold hearings relative to President Quezon's request to have the independence period shortened to July 4, 1939, and regarding the adjustments that might be necessary in the event that Congress shortened the period. The opening of the regular session of the assembly was changed from June 15 to Oct. 15. On Feb. 3-7, the 33rd Eucharistic Congress was held in Manila. The year was marked by disastrous fires, typhoons, and floods in various parts with considerable loss of life and damage to property; and an earthquake in August damaged one of the large office buildings in Manila, where office space was already at a premium. The Sakdalistas, who demand immediate independence and who are said to be communistic, were a cause for alarm on several occasions and several outbreaks occurred among the Moros. The controversy as to precedence between the high commissioner and the president was settled in favour of the former. The assembly met on Aug. 30 to consider emergency school legislation and arrange for elections in 1938. The processing tax on coco-nut oil, imposed as an export tax, amounting to about 100,000,000 pesos, was covered into the Internal Treasury. The outbreak of the Chino-Japanese war tended to bring new economic factors into the situation. Former Governor Harrison became a naturalized Philippine citizen.

**Religion and Education.**—The Filipinos proper are mostly Roman Catholics. The Moros (over 400,000) are Mohammedans; and the so-called wild peoples (over 500,000 including the Negritos) are pagans. In June, 1937, school enrolment was 1,250,000, with about 2,000,000 children of school age (or 60%) not in school. The majority of those in school do not reach beyond the fourth year. Teachers number over 28,800. Children in private schools number about 100,000 and enrolment in the University of the Philippines is in excess of 6,000. High school, college, and university education is given in various institutions, church and secular. About 27% of government revenues goes to education.

**Army and Navy.**—The army (organized by Major General Donald MacArthur) is conscriptive, consisting of a reserve force of citizen soldiers between the ages of 21 and 50. The first class of

20,000 was conscripted on Jan. 1, 1937, and the second on July 1. There is also a small regular force, which will eventually reach some 930 officers and about 10,000 men. This force will take over the police duties now performed by the Philippine constabulary. The army is purely one of defence and no real navy is planned.

**Finances.**—The standard of value is the peso (equivalent to 50¢, U.S.). Estimated budget figures for 1937 were: receipts, 65,817,400 pesos; expenditures, 64,767,138 pesos. Those for 1938 (passed by the assembly in 1937) were: receipts, 80,400,000 pesos; expenditures 76,300,000 pesos. The cedula or poll tax was abolished in 1937 when the total receipts from taxation were estimated at 51,122,000 pesos. The public debt on Dec. 31, 1936, was approxi-

mately 91,161,000 pesos. Monetary circulation, as of May 30, 1937, was approximately 149,152,000 pesos; and total coinage in circulation and in the treasury, approximately 41,085,253 pesos.

Monthly averages in 1936 of debits to individual accounts in banks were approximately 39,291,000 pesos, and for the first five months of 1937, 48,278,000 pesos. Total business of insurance companies (exclusive of life) amounted in 1936 to approximately 1,282,124,000 pesos; and life insurance in force Dec. 31, 1935, approximately 148,974,000 pesos.

**Trade and Communication.**—The value of domestic trade (gross sale of merchants, manufacturers, and peddlers) for 1936 and the first four months of 1937 was 825,680,000 pesos and 290,213,000 pesos respectively. The value of exports and imports for the first nine months of 1937 was 245,695,000 and 157,891,000 pesos respectively, these figures representing increases of about 5 and 13% over the first nine months of 1936. Chief exports for the first nine months of 1937 in millions of pesos were: sugar, 102,655; abaca (Manila hemp), 35,646; coco-nut oil, 31,129; lumber and timber, 6,524; and iron ore, 2,122.

Chief classes of imports in millions of pesos were: cotton goods, 25,922; iron and steel, 16,443; and machinery, 10,193. The United States took by far the greatest proportion of exports and was the major importer with Japan second in both.

During 1936, monthly carloading averaged 105,598 tons and for the first four months of 1937, 240,905 tons. Steamship averages for the same periods were respectively 347,578, and 305,193 tons. On Jan. 1, 1937, there were 28,420 automobiles and 17,355 motor trucks. On the same date, roads of the first, second, and third class were approximately 9,556; 5,165; 2,088 km., respectively. Approximately 159,581,000 pesos are invested in land transportation and 8,755,700 pesos in telephones. Radio control is vested in a radio board created by an act of Oct. 22, 1936. Air service is provided by the Pan American Airways, the Philippine Aerial Taxi Co., and the Iloilo-Negros Air Express Co. The first-named company inaugurated commercial air service between Manila and Hongkong, April 28, 1937. The government released 500,000 pesos toward the construction of an aeroplane basin and national airport in Manila Harbor; and a Bureau of Aeronautics was established Nov. 12, 1936.

**Natural Resources.**—Forest and agricultural products, minerals (especially gold), and fisheries are among the principal natural resources. On Jan. 1, 1937, the capital invested in the lumber industry was approximately 29,387,000 pesos, and the production of 1936 approximately 1,928,000 cu.m. (about 811,303,000 board ft. being cut from public forests). Principal agricultural crops in 1936 were: rice, 118,837,200 pesos; maize, 15,713,900 pesos; sugar cane, 111,593,500 pesos; coconuts, 61,975,500 pesos; abaca, 19,641,300 pesos; tobacco, 3,729,300 pesos; maguey, 816,700 pesos; bananas, 8,037,600 pesos; and rubber, 481,400 pesos. Gold production for 1936 amounted to 633,126 fine ounces valued at 44,318,742 pesos; and for the first four months of 1937, 58,506 fine ounces valued at 4,095,457 pesos. New workings were undertaken at the Baguio mines and new rich deposits were discovered in Mindanao, the latter occasioning a gold rush. Chromite deposits are now being exploited successfully and export has begun. Annual exports of iron ore from Luzon, Mindanao, and Samar reach over 300 tons, most of which go to Japan. Over 600,000 tons of cement were manufactured in 1935 for insular consumption. Other minerals (coal, copper, and manganese) have little or no market.

**BIBLIOGRAPHY.**—Various reports of the U.S. and Philippine Governments; Grayson Kirk, *Philippine Independence* (Farrar & Rinehart, New York, 1936). (J. A. R.)

**Philosophy.** The most important event of the year has been the ninth international Congress of Philosophy, which met in Paris during August. The congress had a membership of about 800, about a third of whom contributed papers, and many more took part in the various discussions. A notable feature of the meeting was the presence of a large number of priests and other clerics, a fact which may be regarded as evidence of the growing *rapprochement* between philosophy and religion in recent years. The congress resolved itself into six sections, which dealt respectively with the following groups of problems: (1) the present position of Cartesian studies; (2) the unity of science, and the methods of science; (3) logic and mathematics; (4) causality and determinism in physics and biology; (5) reflective analysis and transcendence; (6) value and reality. Prominence was given to the philosophy of Descartes in honour of the 300th anniversary of the publication of his *Discours de la Méthode* (1637), which is probably still the most popular introduction to the study of philosophy.

Various other philosophical conferences were held in 1937, and some of them are enumerated here in chronological order. In March, the Southern Society for Philosophy and Psychology met in Columbia, South Carolina. In April, the western division of the American Philosophical Association held a meeting at Galesburg, Illinois. During May, there was a special conference, in New York city, on methods in philosophy and science. In July, the Aristotelian Society of London and the Mind Association had a joint meeting in Bristol. In August, the second international Congress of Aesthetics met in Paris, immediately after the conclusion of the ninth international Congress of Philosophy. In December, the eastern division of the American Philosophical Association held a meeting at Princeton.

As usual, a considerable portion of the philosophical literature of the year was devoted to various aspects of the history of philosophy, including new expositions of the teachings of the great philosophers. Platonism is the theme of a number of new books. There is *Plato's Conception of Philosophy*, by H. Gauss. *Plato's Cosmology*, by F. M. Cornford, contains a translation of the *Timaeus* with a running commentary, and is a valuable companion to *Plato's Theory of Knowledge*, by the same editor. In G. E. Mueller's *What Plato Thinks*, and R. H. S. Crossman's

*Plato To-day*, Plato is, so to say, represented in modern dress. Such attempts to give life to ancient thinkers are quite plausible, and are not without historical precedent. In his *Phaedon*, for instance, Mendelssohn made Plato's Socrates speak like a philosopher of the 18th century.

Of books on later Greek philosophy, mention may be made of D. R. Dudley's *History of Cynicism*. Mediaeval philosophy is represented by J. Ritter's *Mundus Intelligibilis*, which gives an account of St. Augustine's Ontology, and by E. Agnagine's *Pico della Mirandola*.

Turning to the modern history of philosophy, Descartes has received special attention on account of the tercentenary of his *Discours de la Méthode*. The Bibliothèque Nationale in Paris held a special Descartes exhibition, organized by Ch. Adam and others. It contained over 900 exhibits of books,

MANUEL QUEZON, first president of the Commonwealth of the Philippines

manuscripts, medals, pictures, and portraits relating to the life, work, and influence of Descartes. The French Government issued a special postage stamp with a portrait of the philosopher. The *Revue de Métaphysique et de Morale* and the *Revue Philosophique* devoted each a special number to Cartesian philosophy; the *Rivista di Filosofia Neo-Scolastica* issued a special supplementary volume; and numerous articles on Descartes appeared in many other periodicals. There have also been published a number of books on Descartes: Léon Brunschvicg's *Descartes*; H. Gouhier's *Essais sur Descartes*; K. Jasper's *Descartes*; and F. Olgiati's *La Filosofia di Descartes*.

As regards books on other modern philosophers, Bertrand Russell's *Critical Exposition of the Philosophy of Leibniz*, is particularly welcome in view of the growing interest in mathematical logic, of which Leibniz was one of the founders. In a new preface, the author describes, with justifiable satisfaction, how his principal thesis, namely, that Leibniz had based his philosophy on his logic, has received ample confirmation from Louis Couturat's *La Logique de Leibniz*, and his edition of certain literary remains which had been overlooked by previous editors of the works of Leibniz. According to Russell, Leibniz had two philosophies: a logical philosophy leading to Spinozism—correct but indiscreet at that time; and an illogical philosophy—vulgarized, but successful in winning the admiration of princes and princesses. As Leibniz grew older, he kept his sound philosophy more and more to himself. Other books on modern philosophers are: R. I. Aaron's *John Locke*; C. Maund's *Hume's Theory of Knowledge*; G. Le Roy's *Maine de Biran*; L. Prat's *Charles Renouvier*; A. H. Murray's *The Philosophy of James Ward*; and R. M. Loomba's *Bradley and Bergson*.

The problems which received the greatest attention in the philosophical literature of 1937 were those commonly grouped under "philosophy of science." Of the numerous papers read at the ninth international Congress of Philosophy, the papers devoted to these problems aroused the widest interest. They included

papers by the brothers L. and M. de Broglie, Barzin, Enriques, Pos, and Reichenbach, dealing with causality, determinism, probability, empiricism, and rationalism, etc. The same problems also constitute the theme of a number of important books which have been published during the year. Ernst Cassirer's *Determinismus und Indeterminismus in der Modernen Physik* is a valuable companion to the same author's *Substance and Function*, and should likewise be made accessible to English-reading students of philosophy. Physicists who identify indeterminism with moral freedom will do well to study the closing section of the new book. Bertrand Russell's *Principles of Mathematics* has made a welcome re-appearance with a new and long introduction, in which the author explains some changes in his views, and defines his attitude towards the views of Hilbert, Weyl, Wittgenstein, Carnap, and others. The book is most opportune, as R. Carnap's *Logical Syntax of Language* has just appeared in English dress, and will help to enliven the debate between those who (like Carnap) regard the logic of science as "a matter of linguistic choice," and those who (like Russell) do not. Other noteworthy books in this connection are G. Bachelard's *L'expérience de l'espace dans la physique contemporaine* and A. C. Benjamin's *Introduction to the Philosophy of Science*. Of books on general philosophy the most notable are: *Personal Realism*, by J. B. Pratt, one of the founders of critical realism; *Nature and Mind*, by F. J. E. Woodbridge; *Structure and Reality: A Study of First Principles*, by D. W. Gotshalk; *Being and Being Known*, by W. C. Swabey; and *Beyond Humanism*, by C. Hartshorne.

The philosophy of religion has not been neglected in 1937, and a few interesting books have been published. W. G. de Burgh, in his *Towards a Religious Philosophy*, discusses the general problem in a competent and persuasive manner. The new volume of Hibbert lectures, *The Philosophical Bases of Theism*, by G. Dawes Hicks, deals with the special problems of Theism in relation to Pantheism, in a learned yet readable way, and seeks to put new wine into old bottles by an interesting re-interpretation of the old cosmological, teleological, and axiological arguments. The author's philosophical temperament shows itself in his high estimate of calm, rational reflection, as compared with the ecstasy that is so commonly taken or mistaken for religious experience. A more limited problem is considered by W. Kingsland's *Gnosis, or Ancient Wisdom, in the Christian Church*. With much patience and ingenuity the author attempts to unravel the Gnostic and kindred elements in Christianity, apparently for the special benefit of Theosophists.

The comparative study of the philosophical systems of different peoples is rather uncommon, perhaps on account of its intrinsic difficulty. However, a part of this difficult task has been courageously attempted, and accomplished with a considerable measure of success, in *Indian and Western Philosophy* by Betty Heimann.

**Phoenix Islands:** see PACIFIC ISLANDS, BRITISH.

**Phosphates.** Mineral phosphates, chiefly phosphate rock, a phosphate of calcium, are basic fertilizer material, and as such support an extensive producing industry. A world production of 11,760,000 metric tons in 1930 declined to 10,694,000 tons in 1932, and recovered to 10,300,000 tons in 1936. The United States is the leading producer, with 33% of the total, followed by the Soviet Union 15%, Tunis 15%, French Morocco 12%, Ocean and Nauru islands 8%, Algeria 5%, and Egypt 5%. These seven countries account for 93% of the total, and the remaining 7% is scattered among about 30 others. The general producing area in northern Africa, including Tunis, Morocco and Algeria, contributed 32% of the 1936 total, and 50% in 1930,

none of these countries having made material recovery from the depression drop. Although both Egypt and Ocean and Nauru islands suffered only a minor decline, and have recovered to a level well above that of 1930, the Russian output is the only one which has shown an exceptional growth, increasing steadily from 200,000 tons in 1930 to 1,498,000 tons in 1936. The United States output of 3,989,000 tons in 1930 dropped to 1,734,000 tons in 1932, and rose to 3,406,000 tons in 1936. About one-third of the output is exported.

(G. A. Ro.)

**Photography.** The year 1937 showed a growth of activity in the photographic field not equalled for many years past. The motion picture, commercial and amateur branches, was particularly affected. New photographic magazines appeared almost every month, and unprecedented use of photography was made in newspaper and magazine illustration. The most significant step was the establishment of colour photography as a prominent part of the industry, and the conclusion is justifiable that 1937 can be regarded as the beginning of a new era in which colour will largely replace black and white.

**Motion Pictures.**—Total theatres in the world approached 100,000, more than half of which were wired for sound. The attendance at theatres increased more than 10% over 1936. Anxiety over the possible effects of television were partially allayed by a second report of the Academy of Motion Picture Arts and Sciences. It is considered improbable that television will burst on an unprepared cinematograph industry; enormous sums must be spent before widespread urban exploitation of television becomes possible even in the United States. Television service for rural areas is beyond the calculable future. Much activity was shown in England and Germany, but the opinions concerning the development in the United States apply also to these countries. However, improvements in 1937 in the design of electronic projection devices give promise of considerable enlargement of television screen area, the realization of which would vastly accelerate the evolution of television as a practical art.

Improvement in the quality of sound films resulted from the use of recording by ultra-violet radiation, and of special fine grain films for white light recording. Improved high frequency response, better wave form, and lower ground noise were attained. Although not new in 1937, the use of push-pull sound recording increased considerably during the year. The first public demonstration of stereophonic sound was given in New York, using twin sound tracks reproduced through separate channels by loud speakers located at each side of the screen. A number of demonstrations of stereoscopic motion pictures in colour were given, using polarizing screens. Although stereoscopic photography still has considerable appeal, no process is yet available for theatre use which does not have the disadvantage of requiring individual optical viewing devices.

For the lighting of studio sets, increased use of arc lamps was noticed. They are employed exclusively for technicolour films, in conjunction with straw coloured filters for some lights which are too blue in colour. Although a somewhat higher level of illumination is required for colour as compared with black and white, it has been much reduced during the year, and, in fact, in some cases it has been brought down to approximately the level used for a great deal of black-and-white work. New incandescent filament high-wattage lamps were developed in different types, all operating at the same colour temperature, because uniform colour quality of all types of lamp is essential for colour photography. New fine grain negative and positive duplicating films were made available to give duplicates of a quality not obtainable before. Towards the end of the year, panchromatic negative film of exceptionally high speed was beginning to be used. Infra-red

THE DEVIN TRICOLOUR ONE EXPOSURE CAMERA—a Two Mirror Camera for Making Three-Colour Separation Negatives with one Exposure

film was increased in speed and was used to an increasing extent for special effects in photography, particularly for simulating night scenes by daylight. Metro-Goldwyn-Mayer's film, *The Good Earth*, was entirely toned brown by uranium, marking a change in screen quality which was soon followed in other films.

**Colour Photography.**—The year 1937 was notable for a great increase in the use of colour photography in the motion picture and amateur fields, and for commercial advertising and illustration. The technicolour three-colour subtractive process was used practically exclusively for colour films shown in the theatres. The Disney technicolour film, *Snow White and the Seven Dwarfs*, was the first feature-length colour cartoon and was regarded as one of the outstanding achievements of the motion picture art. A new camera was employed to ensure proper relative size of background objects, to illuminate various planes in a scene individually, and to achieve soft-focus effects on the backgrounds. The quality of technicolour films showed a marked superiority over the films of former years. The coronation procession of King George VI was photographed in technicolour and dufaycolour.

Still colour photography was employed to a much greater extent in the commercial field as compared with previous years. In most cases, the original photographs were made as three-colour

separation negatives in one-exposure mirror cameras, although for still life subjects, the repeating back or even the normal camera was much used. Plates and films giving direct colour transparencies were used to some extent for magazine illustration. Those in most common use were dufaycolour, finlaycolour, and kodachrome. Dufaycolour, increased in speed and improved in quality, was applied to some extent to geographical illustration, but mainly by Hollywood motion picture studios, to provide colour transparencies for magazine originals. Finlaycolour continued to be used for geographical and commercial illustration. In general, however, there was a decline in interest in screen unit processes. The kodachrome monopack three-colour subtractive film forged ahead as a medium for commercial work, general illustrative purposes, and lantern slides for lectures and display. The light sources used for still colour photography were confined to daylight, high efficiency tungsten lamps, and flash lamps. No printing process was available by which colour transparencies could be printed on paper in a single step to give good colour prints, but such prints were made commercially in large numbers from separation negatives. Most prints were made by the carbro process, but the recently introduced Eastman wash-off relief process found increasing application. Other printing processes used to a small

extent were dyebro, belcolour, and defender chromatone.

The colour process most used by amateurs was kodachrome, in 35mm. width in miniature cameras, and as 16mm. and 8mm. film in substandard motion picture apparatus. In the United States, about one-half of the amateur motion picture films were made in colour. In Germany, the agfacolour process was introduced for miniature and amateur motion picture cameras. It employs a three-layer film based on the principle described some years ago by Fischer, in which dye coupling components are incorporated in the emulsion.

**Documentary Films.**—Outstanding progress was made in 1937 in the application of photography to the copying of documents. Many types of camera and projector were available for photographing and viewing printed material, commercial documents, etc., on 16mm. and 35mm. film. Particular interest was shown by libraries in making film copies of rare books available elsewhere as originals. About 40 American newspapers file film copies of their daily issues, and copies were made on film of pension cards and the U.S. census cards of 1880. Documents are photographed on film with safety base, and tests made at the Bureau of Standards showed that they should be as durable as printed material on rag paper. They occupy about one-fifth of the space of the original documents, when made on 35mm. film.

**Miniature Photography.**—The interest shown in recent years in cameras taking small film—6 cm. or less, usually 35mm. in width—continued through 1937. Cameras available range from very cheap models with fixed focal lenses to advanced models with high aperture lenses, range finders coupled with the lens focusing devices, automatic film winds, very rapid shutters, and interchangeable lenses and auxiliary attachments permitting extreme flexibility. The cameras are much used by press, commercial, and particularly advanced amateur photographers. The cameras are often used in extremely poor lighting conditions, for which extremely fast films are required, and the negatives are frequently enlarged to considerable magnification, necessitating the manufacture of films of very fine grain and of processing solutions which assist in its attainment. Many formulas have been proposed for fine grain development.

Most of these contain paraphenylene-diamine as the effective reducing agent, but attempts have been made to evolve formulas which do not require the use of this material, which produces marked dermatitis with many users.

**Special Applications.**—There was no important novel development in X-ray photography, although there was a notable general improvement in materials and technique. Chief of these was increased definition associated with extensive use of direct X-ray film, finer grained intensifying screens, and rotating target tubes. Marked interest was shown in the use of X-ray cinematography, and improvement in technique resulted in both the direct and fluorescent screen methods. Industrial radiographers benefited from a study of the characteristics of lead intensifying screens by Seeman. Radiography using ultra-soft X-rays, developed particularly by Sherwood, has found many applications in the realms of biology, paper and textile technology, and the examination of works of art.

Aerial photography continued to be the chief implement of the topographical surveyor, and enormous quantities of film were used in a number of large projects, particularly in soil conservation studies of large areas in the United States. It was also employed in increasing extents in forest and geological survey, and survey for pipe and electric power transmission lines, in addition to map revision.

New films for aerial photography included a fast infra-red film, a new panchromatic film of increased speed and contrast, and a special orthochromatic film for distinguishing scrub from sand,

and such purposes. Films for topographical survey are usually made on low shrinkage support, and during 1937, printing papers having similar characteristics were made available.

Photography is one of the primary weapons of the astronomer. In 1937, photographs were made which resulted in the discovery of infra-red radiation in interstellar space. Plates very sensitive to the extreme red were used in the investigation of stars normally invisible through nebular haze. Photographs made by Major A. W. Stevens from high altitudes during the 1937 solar eclipse gave evidence that the corona was globular in shape.

Increased use was made of telegraphic means of transmitting pictures for press purposes, and portable apparatus was produced for use in the field. High speed photography, either as still or motion picture photography, was rapidly becoming an important means of study in technological and scientific fields. New fast films were made to meet the increasing demands of press photographers. The importance of photography as a means of general illustration was clearly evident from a sudden increase in the number of picture periodicals.

(C. E. K. M.)

**Physics.** Nuclear physics was very popular as a subject for research in 1937. The emission of electrons and positrons by the nuclei of radio-active atoms was studied by several physicists with the object of testing Fermi's theory. Previous results made the number of electrons emitted with low kinetic energies much smaller than Fermi's theory predicted. H. O. W. Richardson and Alice Leigh-Smith devised a new method and obtained results which support Fermi's theory and show that the earlier results were erroneous. Richardson put a small quantity of the radio-active element, in the form of a gaseous compound, into a C. T. R. Wilson expansion chamber and obtained photographs of the tracks made by the electrons emitted by the radio-active gas atoms. This new method shows up the short tracks made by the low energy electrons which were difficult to count by the older methods which required the electrons to pass through a thin plate into a detecting apparatus. The thin plate stopped most of the low energy electrons and it was difficult to determine the fraction stopped. Richardson's results show that there are many more low energy electrons emitted than the older experiments indicated and so support Fermi's theory.

Another important result in nuclear physics obtained in 1937 was the discovery of nuclear isomers. Atoms with the same atomic number, that is, with equal nuclear charges and identical chemical properties, but with different atomic weights, are called isotopes and have been known to exist for many years. Atoms with the same atomic numbers and also with equal mass numbers, that is, with very nearly equal atomic weights but different nuclear properties, are called nuclear isomers and their existence was unexpected although it was suggested a long time ago that uranium  $X_2$  and uranium  $Z$  may be nuclear isomers. This discovery may be compared with the discovery of chemical isomers, that is, compounds of the same composition but different properties, by Wöhler about 1830. The existence of nuclear isomers probably shows that the protons and neutrons in a nucleus are arranged in a more or less rigid pattern with connections or bonds between them just as the atoms in a molecule are arranged. If the protons and neutrons were moving about in the nucleus like the molecules in a drop of water, it is difficult to see how nuclei with equal numbers of neutrons and protons like the nuclear isomers could have different nuclear properties.

The existence of nuclear isomers was first clearly shown by A. H. Snell. He showed that the radio-active isotope of bromine of atomic weight 80 can exist in two forms. The beta activity of one form decays to half value in 18 min. and that of the other in 4 to 5 hours. This isotope can be obtained by four different nuclear reactions. Bromine of atomic weight 79 or  $\text{Br}^{79}$  when bombarded by neutrons combines with a neutron, emits gamma rays and is changed to bromine of atomic weight 80 or  $\text{Br}^{80}$ . This reaction is conveniently represented by  $\text{Br}^{79}(\text{n}, \gamma) \text{Br}^{80}$ . The first symbol in the bracket indicating the body absorbed and the second the body emitted. The other three reactions are  $\text{Br}^{79}(\text{D}, \text{p}) \text{Br}^{80}$  where D denotes a deuteron or heavy hydrogen nucleus and p a proton,  $\text{Br}^{81}(\text{n}, 2\text{n}) \text{Br}^{80}$ , where n denotes a neutron, and  $\text{Br}^{81}(\gamma, \text{n}) \text{Br}^{80}$ . The third reaction in which one neutron is absorbed and two emitted is a new type of nuclear reaction.

The following table shows all the different types of nuclear reactions known at present. Z is the atomic number equal to the number of protons in the nucleus so that the nuclear charge is Ze and A is the mass number so that the atomic weight is approximately equal to A.

Incident Particle	Emitted Particle	Z becomes	A becomes
Alpha . . . . .	Proton . . . . .	$Z+1$	$A+3$
Alpha . . . . .	Neutron . . . . .	$Z+2$	$A+3$
Proton . . . . .	Alpha . . . . .	$Z+1$	$A+1$
Proton . . . . .	Neutron . . . . .	$Z-1$	$A-3$
Proton . . . . .	Deuteron . . . . .	$Z+1$	A
Deuteron . . . . .	Proton . . . . .	Z	$A-1$
Deuteron . . . . .	Neutron . . . . .	$Z+1$	$A+1$
Deuteron . . . . .	Alpha . . . . .	$Z-1$	$A-2$
Deuteron . . . . .	Two neutrons . . . . .	$Z+1$	A
Neutron . . . . .	Proton . . . . .	Z	$A+1$
Neutron . . . . .	Alpha . . . . .	$Z-1$	A
Neutron . . . . .	Two neutrons . . . . .	$Z-2$	$A-3$
Neutron . . . . .	Three neutrons . . . . .	Z	$A-1$
Neutron . . . . .	Gamma Ray . . . . .	Z	$A-2$
Gamma Ray . . . . .	Neutron . . . . .	Z	$A+1$
			$A-1$

The existence of unstable or radio-active nuclear isomers suggests the possibility of the existence of stable nuclear isomers. Stable nuclear isomers would be atoms with equal values of Z and A but slightly different atomic weights and different nuclear properties. For example we should expect them to have different target areas for disintegrations due to collisions and to emit particles with different energies when disintegrated. An element consisting of a mixture of such stable nuclear isomers would give a mass spectrum with lines having a fine structure, that is, very narrow groups of lines instead of single lines. Nothing of the sort has so far been observed, possibly because the resolving power of mass spectrographs is not great enough to separate the lines in the very narrow groups.

Investigations on the collisions between neutrons and protons were published in 1937 by Bonner and others. It was found that the distribution of the particles after the collision was symmetrical with respect to the centre of mass of the two particles. This shows that the interaction between a neutron and a proton is not appreciable at distances comparable with the de Broglie wave length of these particles. Previous results had made the distribution very unsymmetrical.

**Cosmic Rays.**—Several important papers on cosmic rays appeared in 1937. Julian L. Thompson, using the results obtained by A. H. Compton and Turner on the variation of cosmic ray intensity with latitude on 11 trips between Vancouver, B.C., and Sydney, Australia, from March 1936 to January 1937, showed that the intensity has a small daily variation. The maximum intensity is at about one P.M. and the minimum at about one A.M. The

daily variation is about .5%. Previous results had suggested such a small daily variation but were not conclusive. It seems probable that the sun emits some cosmic rays.

Blackett photographed more than 800 tracks made by cosmic ray particles in an expansion chamber in a magnetic field of 12,000 to 14,000 gauss. He found that slightly more than half (53%) of the rays were positively charged. The energy spectrum showed anomalies in the neighbourhood of  $2.5 \times 10^9$  electron volts, that of the negative particles showing a marked minimum at this energy. Particles with energies greater than  $2 \times 10^{10}$  electron volts were observed. The observed energy spectra were interpreted as being the absorption spectra of the cosmic rays in air. It was shown that a cosmic ray has a chance, about one in two, of being absorbed in air, presumably by shower formation, while passing through an energy range near  $2.5 \times 10^9$  electron volts. Blackett found that about 15% of the more penetrating cosmic rays at sea level may be protons, and considered it possible that all the primary rays above the atmosphere may be protons, some perhaps negative protons. Blackett, also found that for energies between 0 and  $3 \times 10^9$  electron volts the energy loss is several times greater than that due to ionization of the air, between  $3 \times 10^9$  and  $10^{10}$  about equal to the ionization loss and between  $10^{10}$  and  $2 \times 10^{10}$  electron volts again several times greater than the ionization loss. The excess energy loss over the ionization loss is due to radiation and shower production.

Bowen, Millikan and Neher measured the cosmic ray intensity with Neher electroscopes at different heights at Madras, India, where the magnetic latitude is only  $3^\circ$  N. They found that the intensity has a maximum value at a height such that 90% of the atmosphere is below and 10% above. With 98% of the atmosphere below the electroscope the cosmic ray intensity was about 65% of that at the maximum. The differences between these results and those previously obtained further north give the variation with height of the field sensitive part of the cosmic rays. The field sensitive part of the cosmic rays are the rays deflected by the earth's magnetic field which are stopped by the field near the equator but not further north. The results show that the field sensitive rays get into equilibrium with their secondary rays after traversing not much more than 10% of the atmosphere.

Anderson and Neddermeyer and also Street and Stevenson have photographed many cosmic ray tracks in a magnetic field and believe that there is evidence for the existence of a new particle with mass between those of the proton and electron. This quite unexpected result, if confirmed will be of fundamental importance. The tracks, believed due to the new particle, had about six times as many droplets per cm. as electron tracks and so were like proton tracks. However, the curvature of the tracks was too great for proton tracks because a proton with the observed curvature would have had far too little energy to make tracks of the observed length. The velocity of the particles was estimated from the number of droplets in the track assuming this to vary inversely as the velocity squared and so the mass of the particles was found to be about 130 times that of an electron or about 13 times less than the mass of a proton. The new particle is supposed to have the same electric charge as an electron. Jauncey has suggested that such particles could be formed by the combination of an electron and a photon of sufficient energy. The energy of the photon would have to be greater than 65,000,000 electron volts, but photons of such high energy may be present in cosmic rays.

The existence of this new particle has been confirmed by Nishina, Takenchi and Ichimiya in Japan. They observed a cosmic ray track for which the product of the magnetic field strength and radius of curvature was equal to  $7.4 \times 10^5$  and after passing through 3.5 cm. of lead became  $4.9 \times 10^5$ . Assuming the loss of energy in the lead to be all due to ionization these results indicate

a particle with mass about  $1/10$  that of a proton. They consider that the highly penetrating cosmic ray particles are all, or nearly all, these new particles with very few, if any, protons or electrons.

**Mechanical Developments.**—A new form of high potential generator has been constructed at the University of Wisconsin by Herb, Parkinson and Kerst and generators of more or less similar design are in process of construction at several other places. This generator is contained in a steel tank  $20 \times 5\frac{1}{2}$  feet. Near the centre of the tank a metal cylinder is supported on a long tube of textolite, which is an insulator and is attached to the ends of the tank. The insulated cylinder is charged by means of two rubber belts running on pulleys. Each belt has a pulley inside the cylinder and another at the end of the tank which is driven by a motor. The belts are charged with electricity at the end of the tank and carry the charge to the insulated cylinder. In this way the cylinder can be charged until the air between it and the tank breaks down. With the air in the tank at 100 lbs. per sq.in. pressure, the cylinder can be charged to a potential of about 2,500,000 volts. A long vacuum tube extends from the cylinder to the end of the tank opposite the pulleys and positive ions from an ion source in the cylinder are driven down the vacuum tube by the potential difference. The ions can be used to bombard targets of different elements and the resulting nuclear reactions studied.

At the University of California a new cyclotron is being constructed which is expected to give positive ions with about 50,000,000 electron volts energy. The magnet for this cyclotron will weigh over 200 tons and the whole apparatus will cost nearly \$200,000. The high energy positive ions will be used to study nuclear reactions and to produce radio-active elements which may be useful for medical purposes.

About a dozen large cyclotrons with magnets weighing up to 100 tons are being constructed at other places in America and Europe.

A great many papers on the properties of neutrons were published in 1937. It has been shown that neutrons probably have a negative magnetic moment of about two nuclear magnetons. Neutrons in bodies containing hydrogen at extremely low temperatures do not give energy to the hydrogen if the energy of the neutrons is less than that required to move a hydrogen atom from its state of lowest possible energy (ground state) to its first excited state in the body.

A very exact new determination of the specific charge of electrons or  $e/m$  was published in 1937. It was found that  $e/m = 1.760 \times 10^7$  electromagnetic units per gram. The value of the electronic charge  $e$  is now believed to be  $4.80 \times 10^{-10}$  electrostatic units so that the mass of one electron is  $9.10 \times 10^{-28}$  gram. The oil drop method and X-ray crystal lattice method now both give  $e = 4.80 \times 10^{-10}$ . The oil drop method depends on the viscosity of air and the value of the viscosity used in getting Millikan's old oil drop value  $4.77 \times 10^{-10}$  has been found to be slightly in error. (H. A. W.)

**Physics, Institute of.** The 2nd conference on industrial physics was held in Birmingham University in March, the subject being "Optical devices in research and industry." There was an exhibition of instruments and apparatus. Various branch meetings were held, and a symposium by the Manchester branch on magnetism was published in book form. The institute has been in touch with the postmaster-general concerning proposed legislation regarding electrical interference with broadcasting. Arrangements have been made for placing students registered with the institute in industrial laboratories in order to give them first-hand experience of physics in industry.

PRESSURE TANK, East Pittsburgh, Pa., 47 feet high and 30 feet in diameter for physicists' experiments in disintegrating the nuclei of atoms

**Physiology.** The close dependence of physiological progress upon progress in other sciences, and particularly in physics and chemistry, continues to be apparent, and a large part of the factual matter and theoretical basis of modern physiology extends into the domains of biochemistry and biophysics. Investigations into the nature of the process whereby the activities of organs are controlled by nerves have aroused widespread interest. As an example, the heart, though able to beat quite independently of its nerves, receives a double nerve supply, the vagus and the sympathetic, the two supplies having functions approximately opposed to one another. The vagus nerve is inhibitory, and when stimulated causes the heart to stop or at all events to slow down its rate of beating. Conversely, the sympathetic supply when stimulated leads to an increased rate and force of beat. It was shown by Loewi in 1921 that when the vagus of a frog's heart was stimulated a substance was given off into the perfusion fluid which when administered to another heart caused it likewise to slow or stop. Similarly, when the sympathetic supply was stimulated, an accelerator substance was released and could be detected by its effect on a second heart. Many researches have sprung up in consequence of this demonstration of what was called the "humoral transmission of nerve

action." The close similarity between the properties of the "vagus substance," released from the heart by vagus stimulation on the one hand, and acetyl choline on the other, soon led to the discovery of their identity. Acetyl choline is of immense potency, one 100 millionth of the body weight producing definite effects. It was further shown that acetyl choline is liberated, not only at the heart, but in all places supplied by the parasympathetic nervous system when the nerves of that system are stimulated. It might be anticipated, therefore, that when one parasympathetic nerve anywhere in the body was stimulated, the acetyl choline carried away from that part by the circulating blood would cause the effect to reverberate in the form of general parasympathetic excitation all over the body. This is not the case, however, because there is an enzyme in the blood choline esterase, which rapidly hydrolyses the acetyl choline into the relatively inert substances acetic acid and choline. Thus the acetyl choline only acts at the site of its liberation, the finely branched nerve endings, and is then rapidly destroyed. It may, however, be spared from destruction by the previous addition to the blood of eserine in small concentrations, since that substance inhibits the activity of the choline esterase. In an animal previously dosed with eserine the results of local parasympathetic excitation become generalized and long lasting.

The substance produced by sympathetic stimulation is similarly liberated on excitation at nearly all sites supplied by the sympathetic nervous system, and closely resembles adrenaline in its physiological properties. Adrenaline, the hormone produced by the medulla of the suprarenal body, has long been known to be liberated into the blood-stream, with resultant generalized effects, resembling those of activity of the whole sympathetic nervous system, when the splanchnic nerve is stimulated. What happens in the suprarenal medulla is thought by many to be merely a copy on a gigantic scale of what occurs at all ordinary sympathetic terminals when they are stimulated. Cannon and the Harvard school, however, are of the opinion that "sympathin," as they call the sympathetic mediator, exists in two forms, one causing the excitatory effects and one the inhibitor, and is not identical with adrenaline. Whatever its nature, the mediator is relatively stable in the blood, so that generalized sympathetic activity of some degree often results from localized sympathetic excitation.

A further step was taken when it was demonstrated that in certain ganglia acetyl choline was set free when nervous impulses passed the junction, or synapse, connecting one relay or neuron with the next. The inference was drawn that acetyl choline acts as a mediator not only as between a nerve terminal and the tissue, e.g. muscle or gland, on which it acts, but also at the junction between one nerve relay and the next.

In the more purely chemical field steady progress has been made in the ever-widening field of sterol biochemistry. Among important sterols are the now quite numerous sex hormones, and the recent identification of the suprarenal cortex hormone as a sterol derivative closely related to the male hormone gives for the first time a reasonable explanation of the occurrence of cases of virilism in women suffering tumours of the suprarenal cortex. It has been shown that the suprarenal cortical hormone has profound and far-reaching effects on the metabolism of the body and these are still under investigation. One of its most interesting properties is its relation to the exchanges of sodium and potassium in the body.

The investigation, in man and other animals, of the curious rhythmical electrical waves—the Berger rhythm—in the brain is one of the recent developments of modern amplification technique. The waves occur at a frequency of about 10 per second, but only when the eyes are closed or in darkness; mental exertion causes them to disappear, as also does sleep. Their presence implies

that for some reason the nerve cells (chiefly in the occipital region) discharge synchronously under certain conditions. (See also BIOCHEMISTRY.)

**Pierné, Henri Constant Gabriel** (1863–1937), French musical composer; born at Metz, Aug. 16. At an early age he entered the Paris Conservatoire, where he studied under César Franck among others, and in 1882 won the Grand Prix de Rome with his cantata *Edith*. From 1890 to 1898 he was organist of Sainte Clotilde, having succeeded César Franck in that position. From 1903 to 1910 he was deputy conductor, and from 1910 to 1924 conductor at the Concerts Colonne. In 1925 he became a member of the Académie des Beaux-Arts; and he was a commander of the Legion of Honour. Among the best known of Pierné's very varied compositions are the opera *Cydalise et le Chèvre-pied* (1923); incidental music to *La Princesse Lointaine* (1895) and *Ramatcho* (1908); and the musical legend *La Croisade des Enfants* (1902). He died at Ploujean, Côtes du Nord, France, in July 1937.

**Pineapples.** Shipments of pineapples from Cuba to the United States and Canada from January to Sept. 1937, were the largest on record for that period. The U.S. took 84,140,000lbs. compared to 61,042,000 the previous year. About 115 cars of pineapples were shipped in 1936 and 1937 to Canadian canning plants. Cuba had approximately 7,000ac. in pineapples in 1937, with production estimated at about 1,600,000 crates of 70lbs. to the crate.

Production of pineapples in Florida was estimated by the U.S. Department of Agriculture as 20,000 boxes in 1937 and 40,000 boxes in 1936. The five-year average was 10,400 boxes.

Imports of pineapples and pineapple products from Hawaii into the U.S. in 1936–37 were 46,000 boxes of fresh pineapples, valued at \$112,000, compared to 68,000 boxes, valued at \$145,000 the previous season, canned pineapple, 570,459,000lbs., valued at \$39,569,000, as against the previous season's 515,751,000lbs., valued at \$33,569,000; pineapple juice, 253,136,000lbs., valued at \$13,754,000, against 156,142,000lbs. worth \$8,511,000 the preceding year; pineapple syrup, 48,000lbs., \$5,000; pineapple cattle feed, 4,187,000lbs., valued at \$38,000. Porto Rico exports of fresh pineapple to the U.S. in 1936–37 were 523,000 boxes, valued at \$1,214,000; canned pineapple, 4,548,000lbs. worth \$264,000.

(S. O. R.)

**Ping-Pong.** The eleventh international tournament for the world's championship in table tennis, held in 1937 at Baden, near Vienna, Austria, resulted in victories for both the men's and the women's teams representing the United States Table Tennis Association. The Swathling Cup was won by the U.S. men's team made up of Sol Schiff and Abe Berenbaum, of New York; James H. McClure, of Indianapolis; and Robert G. Blattner, Jr., of St. Louis. The U.S. women's team which won the Corbillon Cup consisted of Ruth Hughes Aarons, of New York; Jay Purves, of Chicago; Mrs. Dolores Probert Kuenz, of St. Louis; and Emily Fuller, of Bethlehem, Pa. It was the first time the two cups have been won by teams from the same country.

Players from the 30 nations that comprise the International

Table Tennis Federation took part in the 1937 tournament. Other world titles won at the Baden meet were: men's singles, Richard Bergmann (Austria); women's singles, Miss Aarons (U.S.), the title holder, and Trude Pritzi (Austria) were finalists in a "no-contest" match; men's doubles, Blattner and McClure (U.S.), the title holders; women's doubles, Vlasha Depetrisova and Vera Volubcova (Czechoslovakia); mixed doubles, Bohumil Vana and Vera Volubcova (Czechoslovakia). Elmer F. Cinnater, of St. Louis, was the non-playing captain of the U.S. cup teams.

Efforts to lessen the activities of "pushers" (strictly defensive players) was the subject of much agitation among table tennis fans in 1937. In the U.S. new rules have been adopted penalizing pushers and the net has been lowered from 6½ to 6 inches, to favour hitters, while in Europe a time limit of 20 minutes to a game was put in force. The U.S.T.T.A. withdrew temporarily from the I.T.T.F. in 1937 owing to the suspension of Miss Aarons by the English association, but later selected a team to send to the twelfth world championship tournament in London in 1938. Table tennis, which is familiarly known by the trade name "Ping-Pong," in the U.S., has grown rapidly, especially in England.

**Pittsburgh,** a city of Western Pennsylvania, had an estimated population of 685,000 in 1937 and an area of 54-295 square miles. Elections held on November 2 resulted in the strengthening of the Democratic hold on city and county, Mayor Cornelius B. Scully being returned to office for a four-year term.

The University of Pittsburgh celebrated its sesquicentennial on February 25. On June 4 the cornerstone of the new Cathedral of Learning was laid. The building to the 27th floor is now, Jan. 1, 1938, occupied. The Stephen C. Foster Memorial, located on the university campus, was dedicated June 2, 1937. It is one of the finest memorials to a composer that has yet been created, consisting of an auditorium for intimate music and drama and an exhibition hall. The memorial possesses the best existing collection of Fosteriana, the gift of Mr. Josiah K. Lilly.

The Buhl Foundation began the erection for the city of its gift of the \$750,000 Buhl Planetarium on the North Side Diamond. The Pittsburgh Symphony Society raised a fund of \$250,000 as a two-year maintenance fund. The International Art Exhibit was held in Carnegie Art Galleries from October 14 to December 5. "The Yellow Cloth" by Georges Braque was awarded first prize. May 5-9 the Mellon Institute dedicated its new home with a series of meetings. The building is trapezoidal in form, nine

stories high on the inner court and six on the street. It is modeled after a Greek temple with sixty-two monolithic granite columns.

The Community Fund drive, November 8-30, reached its goal of \$2,500,000. The new State Department of Public Assistance is not likely to affect the present public welfare administration of the city.

The most significant news of 1937 was the transfer of the main offices of the U.S. Steel Corporation from New York to Pittsburgh. The corporation broke ground May 22 for a new sheet, strip, and tin plate plant that will employ about 4,000 men and produce 600,000 tons of steel a year. It opens in June 1938. Steel production flourished at the beginning of the year, but dropped from 96% of capacity in May to about 20% in December; the total tonnage of pig-iron for Pittsburgh in 1937 was estimated at 8,100,000 tons, the highest since 1929 and about 20% above the 1936 production. The general business index (based on the 1923-25 average) was 108.5 for 1937, an improvement of 10% over 1936.

(J. G. Bo.)

**Pius XI.** As supreme pontiff of the Universal Church and vicar of Jesus Christ, Pope Pius XI is the 260th successor of St. Peter in the See of Rome. Born at Desio, near Milan, on May 31, 1857, Achille Ratti was ordained priest on Dec. 20, 1879. He served successively as prefect of the Ambrosian Library, Milan, and of the Vatican Library, Rome. Appointed apostolic visitor to Poland in 1918, he was made nuncio in 1919 and consecrated archbishop of the Titular See of Lepanto. On June 16, 1921, he was created cardinal and named archbishop of Milan. Eight months later, upon the death of Benedict XV, on Feb. 6, 1922, Cardinal Ratti was elected pope and was crowned on February 12 as Pius XI.

The vigour and forcefulness in word and action that had characterized Pope Pius during the first 14 years of his pontificate were dimmed in the latter months of 1936 when he suffered from his first serious illness. On Christmas Eve, however, he broadcast from his sickbed a message of peace to the world. He threw off the burden of age and infirmity, and on Feb. 14, 1937, he was able to leave his chamber, and in April was presiding at his Vatican desk. On May 1, he left for the papal villa at Castel Gandolfo, where he celebrated his 80th birthday on May 31, and returned to Rome on September 30. During the entire year, though in a lessened degree, he gave private as well as large public audiences, presided at religious ceremonies, official congregations and assemblies, and very personally directed the world-wide affairs of the Church entrusted to him.

Among the many documents issuing from his hand in 1937 were three notable encyclical letters: *Mit Brennender Sorge*, March 14, dealt with the persecution of Catholics in Germany and charged the Nazi Government with a violation of its pledges; *Divi Redemptoris*, March 19, condemned the evils inherent in atheistic Communism and proposed the Christian means for saving society from the present chaotic conditions; *Ingravescentibus Malis*, September 29, recalled devotion, through the rosary, to the Blessed Virgin as the protectress against heresies. Many apostolic letters were directed by him to members of the hierarchy throughout the various nations treating of the problems affecting the Church. That sent to the Mexican bishops, *Nos es muy conocida*, March 28, was of exceptional importance.

Through the spoken word, Pope Pius frequently addressed the Faithful. On February 8, over an international hook-up, he delivered the closing address at the International Eucharistic Congress at Manila. On July 11, he broadcast an appeal for prayers for a confused world on the occasion of the dedication of the Basilica of Ste. Thérèse, Lisieux, France. At a secret consistory on December 13, at which he created five cardinals, he deplored the

POPE PIUS XI

attack on religion in Russia and Germany, the wars in Spain and the Far East. Again on December 24, addressing the College of Cardinals, he specifically protested against the Nazi persecution. Through all his utterances, Pope Pius besought God and men to bring to this warring world the blessings of national and universal peace.

**Planetariums** are not new. Three-dimensional mechanical instruments, capable of showing the relative positions and movements of the sun, moon, and planets, have been in use for hundreds of years. The projection planetarium, however, is a modern development, the first one having been installed in Munich in May 1925. This instrument differs from the old type of planetarium in that it has no globes to represent the sun, moon, planets, etc., but instead depends entirely upon the projection of light. And, in the projection of the heavenly bodies, the new instrument is much more than a planetarium, for there are shown in a most realistic way on an artificial sky-dome all of the planets, all of the stars—including the milky way—all of the heavenly bodies that can be seen by the best eyes under ideal conditions from any place on the earth's surface; and these are shown in their motions, both apparent and real.

In these motions it is possible to show the rising and setting of the sun, moon and stars, the apparent annual motion of the sun and the precession of the equinoxes. The observer's latitude can be changed to that of any point on the earth's surface from the North to the South Pole. One can travel forward or backward in time and show with great accuracy the skies for any period of history.

The projection planetarium was invented by Dr. Walter Bauersfeld, of the Carl Zeiss Optical Works of Jena, and all of the instruments have been manufactured by this firm. There are now (Jan. 1, 1938) 26 of these machines in the world. Four of them are in the United States—one each in Chicago, Philadelphia, Los Angeles, and New York—and a fifth has been ordered for Pittsburgh.

The popularity of these institutions is indicated by the attendance at the Hayden Planetarium in New York city, which had during the first two years of its operation nearly 1,500,000 visitors. It is the belief of the writer that the projection planetarium is without doubt the greatest invention ever devised by man as a visual aid in teaching in any field in the entire history of education. More than that, it provides an emotional experience replete with beauty and dramatic power. No description in words can give any adequate idea of its performance. The night sky of the planetarium, with its illusion of the immensity of space and the realistic representation of the stars including the milky way, must be seen to be appreciated. (C. Fi.)

**Plant Nutrition:** see BOTANY: *Plant Nutrition*.

**Plastics Industry.** There has arisen during the past ten years a new, world-wide industry which had small beginnings about 60 years ago, and, although many have objected to the name of plastics which has been given to it, this name has now been accepted by all countries. The best definition that has so far been given to the word is that of an American firm, which aptly states that "Plastics are man-made chemical combinations of Nature's raw materials. They are solid at ordinary temperatures, but when heated become soft and pliable. When moulded under pressure they take any desired shape and retain it."

This definition is true for all the materials of the industry, and can therefore be accepted as the practical one.

The materials which are generally accepted as being within the industry are the bitumens, casein, cellulose, and synthetic resins; but closely allied to them are hard rubber and the natural resins, particularly shellac, and all these materials are again subdivided into thermo-plastic and thermo-setting classes. By the former class is understood those that can be re-used by the application of heat, while the latter class are those that are irreversible after the initial heating has been applied.

The most striking developments that have taken place during 1937 have been in the thermo-plastic class, in which have been produced synthetic resins that have properties equal to that of quartz glass and have been used for such purposes as windscreens for aeroplanes and lenses for optical purposes and similar uses, where non-fragility is of the greatest value. A further development in this class is the enormous stride made in the injection process of moulding cellulose plastics, from which are produced such articles as spectacle frames, bezel frames, motor-car steering-wheels, bottle-caps, and a host of other articles.

In the thermo-setting class of plastics the year under review has been one of steady development and a widening of the uses of this class, one of the most striking being the development of a synthetic resin suitable for use in water-softening apparatus, while another is the application of laminated synthetic resin materials for decorative purposes, such as table-tops, wall-panelling, counter-tops, and doors.

Owing chiefly to the rapid growth of the industry and to the varying methods adopted by each country in the tabulation of their national statistics, it is not possible to obtain reliable figures of the production of plastics materials; but for 1935 it has been reliably estimated that 80,000 tons of synthetic resins and about 20,000 tons of cellulose materials were manufactured in the world, the principal countries being the United States of America, Germany, and Great Britain, in that order. Since that date, however, because of its policy of restricting imports, Germany has, it is estimated, become the chief producer of plastics, especially in those products which can be utilized to replace imported natural materials such as rubber. Other countries which have devoted a considerable

amount of attention to this industry are Japan, Russia, Italy, Norway, and Sweden. In fact, it might be said that there is no country in the world that has not enthusiastically taken up the production of plastics, and it can confidently be said that the future trend of this industry can hardly yet be predicted, having in mind the sources still awaiting investigation, such as the production of a uniform shellac, a resin based on sugar or alcohol, or a plastic material from the versatile soybean.

(E. J. W.)

**Platinum.** No data have been published on the Russian platinum output since 1926, and data on exports are incomplete; since these figures vary widely from year to year, the world totals fluctuate accordingly, and do not represent a true picture of the industry. A world total of 205,000 troy ounces in 1930 dropped to 178,000oz. in 1932, and increased in the following years to 240,000oz. in 1933, 280,000oz. in 1934, and 353,000oz. in 1935; the 1935 figure was swollen beyond normal by a heavy transfer of Russian stocks to London, and so is not representative; almost no Russian figures are available for 1936, so a world total cannot even be estimated as yet, but indications seem to point to a considerable drop from 1935, and more in line with the years immediately preceding.

Although the oldest and most consistent large producer, the Soviet Union has recently lost first place to Canada with its growing output of by-product platinum, recovered from the Ontario nickel ores. From 12,500oz. in 1929, the Canadian production increased to 131,600oz. in 1936, with prospects for a further increase in 1937. The next largest producer is Colombia, with an output which has ranged from 35,000 to 55,000 ounces. The fourth large producer is South Africa, which had a high figure of 45,500oz. in 1930, but has averaged about 26,000oz. since 1934, after having dropped to 5,800oz. in 1932. The United States output stands fifth in the list, with 5,600oz. in 1929, a low of 1,300oz. in 1933, and a recovery to 7,400oz. in 1936, the yield in 1935 and 1936 having been boosted above the normal recovery level by a newly discovered placer deposit in Alaska; normally, most of the output is a by-product from the refining of copper and gold.  
(G. A. Ro.)

**Plums and Prunes.** Dried prunes were generally a disappointing crop throughout the world in 1937, with an almost complete crop failure in the Union of South Africa, a greatly reduced yield in Australia, Rumania and Yugoslavia, a negligible production in Bulgaria and a slightly higher-than-average crop in the United States. The International Institute of Agriculture estimated the combined exportable surplus in Rumania, Yugoslavia and Bulgaria as 23,600 short tons, compared to 52,300 tons in 1936, but a carry-over from the 1936 crop increased the 1937 export supply to 29,100 short tons, the Institute estimated. The English market anticipated only 350 tons from Australia and none from South Africa which exported 275 short tons in 1936 and 1,260 tons in 1930, and which is normally the leading exporter of prunes in the British Empire. In the United States dried prune production in 1937 was estimated by the Department of Agriculture as 247,000 tons (dry basis), compared to 184,300 tons in 1936, and a five-year (1928-34) average of 226,140 tons. Production of plums and prunes for fresh use in California, Oregon, Washington, Idaho and Michigan was 109,000 tons in 1937, compared to 110,500 tons in 1936, and the five-year average of 123,880 tons. Prunes for canning and cold packing in Washington and Oregon were estimated at 25,000 tons, compared to 28,900 tons in 1936, and the five-year average of 11,020 tons.  
(S. O. R.)

**Pneumonia.** Perhaps the most important advance in pneumonia control in 1937 was the formal inauguration by New York State of a campaign for pneumonia control. Massachusetts has the distinction of having preceded New York by two years in the initiation of such a plan. Before the year was out New York city had followed New York State, and at the present time both the State and the city have established bureaus for pneumonia control with full-time directors in charge. Furthermore, the State and city both provide free of charge not only methods for determining the various types of pneumonia but also therapeutic sera for the more important types.

Details of the New York program will be found in a recent report by the Committee on Public Health Relations of the New York Academy of Medicine. The method of organization has been described in a pamphlet by Dr. Edward S. Rogers, director of the New York State Bureau of Pneumonia Control.

During 1937 favourable reports on the value of pneumonia serum continued to appear in the literature, not only for Type I and Type II for which serum treatment has become well established, but also for some of the newer types, particularly Type V, Type VII, and Type VIII. The death rate for these various types has been cut approximately 50 per cent by serum treatment, but when serum is given very early, the reduction is even more marked, probably two-thirds or three-fourths.

For the first time in history the physician now has at his disposal a serum of great value for the treatment of pneumonia and quick methods of making accurate bacteriological diagnosis. (See also SERUM THERAPY.)

Another contribution of great interest to the pneumonia problem was made by Horsfall and his co-workers at the Rockefeller Institute on the use of pneumonia rabbit serum in the treatment of lobar pneumonia. Twenty-two patients of various types were treated with type specific rabbit serum with only one death. Twelve of the 22 patients had pneumococcal bacteraemia at the time rabbit serum was administered. According to these writers the results are even more spectacular than with horse serum, the product which has been in use up to the present time. The rabbit serum seemed to have an additional advantage in that it penetrated the pleura in two cases and sterilized pleural exudates, thereby preventing the development of empyema.

One of the most important discoveries of recent years is the demonstrated value of sulphanilamide in the treatment of streptococcus infections. Streptococcus pneumonia is comparatively rare except in time of epidemics, but already physicians have discovered the value of sulphanilamide in streptococcus pneumonia. Claims have also been made by Heintzelman, Hadley, and Mellon that sulphanilamide is of value in the treatment of pneumococcus Type III pneumonia. These claims, however, have not yet been substantiated. Another development of interest which emanates from workers at the Mellon Institute in Pittsburgh is a cinchona compound which is devoid of injurious effects on the nerves and still has a bactericidal action on the pneumococcus. It has long been known that certain quinine derivatives were highly toxic for the pneumococcus, and some of these, notably ethylhydrocupreine, have actually been tried on patients. Most of them, however, are too toxic to be used in large doses. Maclachlan and his co-workers report that hydroxyethylapocupreine has been administered in large doses to 200 patients without any visual or other nervous disturbances. The group of patients who received the cinchona derivative showed a 26 per cent reduction in mortality over a control series, but these statistics may be open to criticism in several respects. This review indicates that rapid progress is being made in the specific treatment of pneumonia and that because of this progress we can look forward to definite reduction in the pneumonia death rate in the next few years. (R. L. C.)

**Poland,** republic of Central Europe, member of the League of Nations. Bounded N. by the Baltic sea, East Prussia, and Lithuania, E. by Russia, S. by Rumania and Czechoslovakia, and W. by Germany. Capital, Warsaw. President, Ignace Moscicki (born 1867; elected 1926; re-elected 1933). National flag, white and red, in equal horizontal stripes, the former bearing the eagle and crown on a red shield.

**Area, Population, and Cities.**—Area: 150,052 sq.mi.; population: (1931 census) 31,942,027; (1936 estimate) 33,823,000:

County	Area (sq.mi.)	Population (1931)
Bialystok . . . . .	12,525	1,643,485
Cracow . . . . .	6,710	2,296,842
Kielce . . . . .	9,880	2,936,976
Lodz . . . . .	7,349	2,633,050
Lublin . . . . .	12,037	2,467,266
Lwow . . . . .	10,968	3,127,811
Nowogrodek . . . . .	8,867	1,056,780
Polesie . . . . .	14,158	1,131,455
Pomorze . . . . .	6,335	1,086,259
Poznan . . . . .	10,256	2,114,251
Silesia . . . . .	1,628	1,298,352
Stanislawow . . . . .	6,523	1,476,538
Tarnopol . . . . .	6,383	1,603,313
Warsaw . . . . .	11,378	2,530,675
Warsaw (City) . . . . .	47	1,178,914
Wilno (Vilna) . . . . .	11,201	1,275,269
Wolyn . . . . .	13,805	2,084,791

Three-quarters were Roman Catholics; one-eighth Orthodox. There is liberty of conscience. Of languages, 69 per cent spoke Polish, 16 per cent Ruthenian, 9 per cent Hebrew; there were 741,000 Germans (2.3 per cent).

Elementary education is compulsory; all education is free. Statistics (1935-36): 27,990 elementary schools with 4,681,345 pupils; 755 secondary schools with 181,138; 6 universities and 18 high schools with 47,161.

After Warsaw, the largest town is Lodz (638,857); Lwow, Poznan, Cracow, Wilno exceed 200,000, and five others 100,000 (1937). Ports: Danzig (*q.v.*) and Gdynia (84,000).

**History.**—The president is in supreme control; term of service, seven years. He appoints the premier (president over ministry of 10) and one-third of the senate (96); members of the Sejm (208) are elected for five years by universal adult suffrage. There are no political parties in either chamber.

At home uneasiness was general. A return to the party-system seemed possible. Incidents were appeals for unity, notably by Col. Adam Koc, leader of the Polish National Union, and Marshal Smigly-Rydz, Pilsudski's successor; the attempt to assassinate the former (July 17); the formation of three new parties; and a discussion between the president and the Socialists, with stabilizing results. Meanwhile, the four-year investment plan was extended (the year's expenditure on public works to be nearly £32,000,000). Anti-Semitic action broke out anew: Jews were unprecedentedly banned from the National Totalitarian Party; the medical profession banned, and the lawyers restricted them; a serious pogrom

## POLAR REGIONS—POLICE

occurred in Brest-Litovsk (May); the "anti-Jewish month" proclaimed (September) by Fascist parties was rigorously observed. Suspension of the executive of the Teachers' Union led (October) to a teachers' strike. Hurricanes and floods occurred in May. In July, prices being already controlled, the embargo on the export of flour was extended to cereals until July 1938. There were peasant unrest and strike clashes.

The Danzig harbour protocol was extended until 1939. In September tension arose from Polish children in the Free City being required to attend German schools, but in November an agreement was reached with Germany on the treatment of minorities. The Silesia partition agreement having expired, its resuscitation was inconclusively explored. A loan from France of £25,000,000 included an arms credit of £12,000,000. Col. Koc's defence program was endorsed by President Moscicki. In March a trade agreement was made with Germany. An exchange of visits between the president and King Carol foreshadowed a Polish-Rumanian alliance. For the Lithuanian question see LITHUANIA.

**Trade and Communications.**—Agriculture predominates; leading crops: potatoes and rye. In 1936 there were over ten million cattle and seven million pigs.

Natural resources include coal, iron, zinc, salt, naphtha and petroleum, and timber. Textiles and sugar are manufactured. Both imports and exports—1,003,435,000 zlotys (£40,000,000) and 1,026,208,000 zlotys (£41,000,000) respectively—showed a substantial increase (1936). Britain took nearly a quarter of the exports (bacon, eggs, timber, leading) and sent out goods to half their value.

The State railways had 12,480 miles open; there were 36,000 miles of roads and nearly 9,000 of navigable waterways. But means of communication (including telegraphs and telephones) await further development. The air lines recorded 5,842,000 passenger-kilometres and 543,000 mail-and-goods-kilometres (1935). The merchant navy is small; two liners were building in England.

**Finance and Banking.**—The unit of currency is the (nickel) zloty (at par, 43.38 zlotys=£1). The 1936-37 budget balanced at 2,221 million zlotys. The Bank of Poland issues notes (one-third covered); in circulation on Feb. 20, 1937: 951,382,000 zlotys. In the Post Office Savings Bank, 2,286,830 depositors were credited with 663,720,000 zlotys; there was as much again in others (1936).

**Defence Forces.**—The army (compulsory service) had (1936) 17,905 officers and 248,110 other ranks; the air force and navy were nuclear. (See also ANTI-SEMITISM; WATER POWER.)

**Police.** The 13th Annual Congress of the International Police Commission was held in England, in London, in June 1937. This commission, established in 1923 thanks to the efforts of Dr. Schober, police president of Vienna and subsequently chancellor of Austria, has met at various European capitals—Vienna, Berne, Paris, Rome, Antwerp, Copenhagen, and Belgrade. Its aim is to develop and co-ordinate measures and institutions for the suppression of crime and for mutual assistance between the police authorities of different countries. Twenty-six European, the United States and four other countries, are represented and send delegates to the annual meetings of the commission.

Among the matters considered at the London meeting in June 1937 were (a) the drug traffic; (b) the counterfeiting of securities; (c) passport forgeries; (d) standardization of criminal records and statistics; (e) telegraphic transmission of finger-prints; (f) prevention of international frauds, such as the Spanish prisoner and the buried-treasure swindles, etc. International criminals are naturally those to whom the commission devote special attention; they are more particularly the trouble of countries with land frontiers, but all suffer to some extent from them.

The work of the commission has resulted in valuable inter-

changes of information in regard to scientific aids for the detection of crime and improved methods of dealing with many other police problems. There is an increasing tendency among the English-speaking and other nations to learn from each other in police matters, and visits of police officers to examine conditions in countries other than their own are frequent. The year 1938 will see a member of staff of the Federal Bureau of Investigation at Washington (the now world-famous "G-men") at the Police college at Hendon, established in 1934 by Lord Trenchard, and a reciprocal visit by a Scotland Yard officer to Mr. Edgar Hoover's department.

Apart from crime, the most important police problems in the large cities of the world are those arising in connection with motor traffic. In Scotland Yard's annual report for 1936, regulation of traffic and the prevention of road accidents received the largest share of attention, because of the extent to which the police have increasingly to devote themselves to protecting life and limb on the roads. The same can be said of many other reports by chief officers of police. In no country, however, has there been, as yet, much, if any, progress in reducing casualties. The most that can be said to have resulted from legislation and police efforts to enforce it, and from the many devices for securing safety, such as better roads, pedestrian crossings, mechanical signals, etc., is that casualties have been prevented from mounting still higher.

The year 1937 was not marked by any very grave outbreaks of public disorder, except in countries where war or warlike conditions prevailed. In Paris there were fascist-communist riots in March, followed by a general strike. These disturbances were, however, much less serious than the riots of Feb. 1934, and perhaps the most noteworthy incident in connection with them was the announcement that the French Government had decided to withdraw fire-arms from the police; but this has not yet been done.

In the United States in May there was a serious clash between steel strikers and the police in Chicago, and similar troubles occurred in Trinidad and Barbados in June and July. (See also **CRIME**.)

The character of the crime with which police have to deal differs considerably from country to country, but everywhere thieving forms the bulk of crime. The latest (Third Quarterly Bulletin, 1937) of the very valuable *Uniform Crime Reports* now issued for the United States and its possessions by the Federal Bureau of Investigation, shows that larceny, burglary or housebreaking, and the theft of motor-cars account for over 90% of crime; and much the same holds good of every country. It is in respect of the balance of 10% that variations occur. In Britain, in contrast with Continental countries and America, crimes of violence continue to be very rare and murders are almost confined to detective stories. Particularly marked in some countries is the growth of juvenile crime. (See **JUVENILE DELINQUENCY**.)

Every year sees increasing use made of scientific aids in the prevention and detection of crime. Most up-to-date forces now use wireless for the immediate dissemination to police patrol cars of information relating to crime, and the radio has led to the establishment of Central Information Bureaus or Complaint Rooms at police headquarters in touch with the patrols through the air and with the public by telephone. Large cities are also now generally equipped with call boxes, or "crime-prevention kiosks," through which the public can get into instant communication with police stations, and the stations send out calls to the foot police on duty in the streets. (See also **LIE DETECTOR**.)

Finger-prints remain the unchallenged and most valuable aid to the identification of criminals, and Scotland Yard's single print system, which has enormously increased the speed of identification and the extent to which sub-classification can be carried, is

coming everywhere into use. The *modus operandi* of classification and detection has also now been generally adopted.

In most countries there is a branch of the police whose work has a political character, but recent years have brought out the marked contrast between democratic and dictatorship countries in this respect. In the former the political work of the police has to do solely with the security of the State, in the ordinary meaning of that phrase, that is to say, protection against political extremists, ill-disposed aliens, etc., and various measures necessary in the interests of national safety. In his recent book *The Police and Modern Society*, Mr. August Vollmer, the well-known ex-police chief of Berkeley, Calif., and professor of police science at California university, says "Democracy's strongest reliance is the police." This is equally true of dictatorship, but in a different sense. In the countries which still enjoy representative democracy the maintenance of internal law and order by an efficient and impartial police, using no disguise save for the prevention and detection of crime, has been well described as the prop that sustains society and the amenities of civilized life. Under the absolute governments that now hold sway in Germany, Italy, and Russia, the continuance of the existing régime is dependent on a secret police and a widespread system of espionage which is as destructive of individual liberty as any known to past ages.

A comparative study of the annual reports of different police forces brings out the essential similarity of police work the world over, and they all have their amusing features. For example, the New York police, who have as difficult a task as any, are not entirely occupied with gangsters. The report for 1936 gives statistics as to cats rescued from trees, roof-tops, etc. It was stated in the London papers recently that, when Scotland Yard appealed to the public to make more use of the machinery for obtaining the assistance of police in an emergency, a number of similar cat calls were received, and also an inquiry from a lady as to what to do with a beetle and a matchstick which she had found in her loaf of bread. In addition to cats, the New York report mentions monkeys, snakes, bears, birds, squirrels, and even alligators "secured, destroyed, or delivered to owners." That of the Royal Canadian Mounted Police (the "Mounties") ranges from details of murder cases, rum-running, wheat thieves (who have taken the place of the old cattle "rustlers"), and the supply of walrus meat and "green" fish for police dogs, to the desirability of persons subject to periodic loss of memory registering their finger prints with the police, so that when they forget who they are they can call at the police station and find out. (See also **FEDERAL BUREAU OF INVESTIGATION**.) (J. F. Mo.)

**Poliomyelitis:** see **INFANTILE PARALYSIS**.

**Polish Corridor:** see **EAST PRUSSIA**.

**Pollard, John Garland** (1871-1937), American lawyer and administrator who served as governor of Virginia from 1930-34. He was born in King and Queen county, Va., Aug. 4, 1871, and was graduated from Columbian (now George Washington) university in 1893. Admitted to the Virginia bar, he practised in Richmond for twenty-five years.

He was a member of the Virginia Constitutional Convention (1901), chairman of the Virginia Commission on Uniform State Laws (1902-07) and attorney-general of Virginia and member of the State Board of Education (1913-17). In 1920 he was a member of the Federal Trade Commission and in 1922 was appointed dean of the Marshall-Wythe School of Government and Citizenship at the College of William and Mary. After his term as governor, he became chairman of the Board of Veterans' Appeals in 1934. He died in Washington, D.C., April 28, 1937.

**Pollock, Sir Frederick** (1845-1937), British legal expert whose *History of the English Law* (1895) and *The Expansion of the Common Law* have become classics. He also edited the *Law Quarterly Review* and the *Law Reports* from 1895-1935. His erudition in other fields was witnessed by such books as *The Etchingham Letters* (1899) and *Life and Philosophy of Spinoza* (1880). He was born in London, Dec. 10, 1845, and attended Trinity college, Cambridge. After reading law at Lincoln's Inn, he became professor of jurisprudence at University college, London, in 1882, and professor of common law in the Inns of Court two years later. From 1883-1903 he was Corpus professor of jurisprudence at Oxford university. He also served as judge of the Admiralty court of Cinque Ports from 1914-36, as a member of the Royal Labour Commission (1891-94), and as chairman of the Royal Commission on Public Records (1910). He died in London, Jan. 18, 1937.

**Polo.** Outdoor polo in 1937 was featured by the national open championship at the Meadow Brook Club, Westbury, Long Island. This tournament, with an entry of five of the best teams in the country and one from the Argentine, was played before the largest crowds in the championship's history and was won by the Old Westbury team of Michael Phipps, Cecil Smith, Stewart Iglehart and C. V. Whitney. The national junior championship and the twelve goal championship were won by the Santa Barbara team of California and the popular inter-circuit championship for the medium and low goal players was again won by the Huisache squad from Houston. Establishment of a far western division of the intercollegiate championship was made and this first tournament was won by the University of Arizona. The U.S. Military Academy captured the eastern division of this championship held on Governors Island.

Thomas Hitchcock's play during the season was again a high spot and included with him at the pinnacle of the game—a rating of ten goals—were Stewart B. Iglehart and Cecil Smith.

While indoor polo is confined mostly to the eastern and middle western parts of the United States, it showed a steady growth in member clubs and spectator interest. The New York Athletic club trio continued as the leading team, winning the senior division of play in the national championships held in New York in March.

A complete revision of the rules of play of the indoor game took place early in December, the most important change being the adoption of the outdoor free hit in place of the one-half point deduction for fouls. The new rules have proved popular with player and spectator alike. (R. F. K.)

**Great Britain.**—An outstanding feature of the 1937 season in England was the visit of the Australian Goulburn team, which consisted of the four brothers Ashton. This was their second visit, as they came as a complete polo team as far back as 1930. On this latest occasion they proved a great combination, crowning their season with victory in the Champion Cup, although in this contest P. Ashton was unable to take his place in the team.

The Hon. Keith Rous's Jaguars also had a most successful season. They were narrowly defeated by the Goulburn team in the final of the Champion Cup, and were victorious in the Roehampton Open Cup and the Coronation Cup. The Ranelagh Open Cup was won by the Nawab of Bhopal's team, and the inter-regimental tournament by the 10th Hussars. At the Indian Empire garden party, held at Hurlingham, India beat a team chosen from the rest of the world.

Oxford won the annual contest with Cambridge by 12 goals to one.

One change in the laws of the game was on trial during the season. In addition to the free-hits from 60 and 40 yards, which could formerly be awarded as penalty for crossing, more severe

cases were penalized by a free hit from 30 yards. The conclusion of the vast majority of those interested in the game is that the additional penalty rule was a wise innovation, and there is no suggestion of its deletion.

**Polytechnics:** see VOCATIONAL EDUCATION.

**Pomerene, Atlee** (1863-1937), Democratic senator from Ohio between 1911 and 1923, who served as joint prosecutor in the Teapot Dome oil scandals of 1924 and as chairman of the Reconstruction Finance Corporation during 1932-33, was born in Berlin, Ohio, Dec. 6, 1863. Chosen as U.S. senator in 1910 because of local party services, he at once displayed a seriousness of purpose and a refusal to be dominated by outside interests which raised him to a prominent position. High lights of his Senate career were opposition to the Plumb plan for employee control of the railroads, sponsorship of the armed-ship bill during 1916, participation in creation of the Federal Trade Commission, and opposition to the prohibition and woman suffrage amendments to the Constitution. No sooner had he left the Senate than he gained even wider fame through his work in exposing the activities of Doheny and Fall. Chosen by President Hoover to head the Reconstruction Finance Corporation in 1932, he was not confirmed but served until replaced early in the following year by President Franklin Roosevelt. He died in Cleveland, Nov. 12, 1937.

**Pope, John Russell** (1874-1937), American architect, was born in New York city, April 24, 1874. He was especially noted as designer of several buildings located in the national capital: the Scottish Rite Temple (1916), Constitution Hall (1929), the National Archives Building (1933), the National Gallery of Art begun in 1937 and the projected Jefferson and Theodore Roosevelt Memorials. International recognition was accorded his designs for additions to the Tate Gallery in London (1936) and the war memorial at Mountfacon, France (1937). He received numerous awards for his work and from 1933 until his death in New York city, Aug. 27, 1937, was president of the American Academy in Rome. For further information on his career see the *Encyclopædia Britannica*, vol. 18, p. 225.

**Popular Front.** The *Front Populaire* was formed in France (after various preliminary movements) at the beginning of 1936, as an electoral alliance between the Socialist, Communist, Radical, and certain smaller parties, on the basis of an agreed electoral program. It won a handsome victory in the general election of 1936, and has provided the parliamentary backing for the Governments of M. Blum (Socialist) 1936-37, and M. Chautemps (Radical) 1937, both including Socialist and Radical, but not Communist, members. The Blum Government was driven from office in 1937 by the financial crisis, which took the form of a "flight from the franc" by French capitalists distrustful of the Government's measures. The Chautemps Government, with M. Bonnet, a right-wing Radical, as minister of finance, sought to reassure the capitalists by measures of economy; and the Socialists and Communists, though they disliked the turn to the right, supported the new Government on account of the international situation.

The *Fronte Popular* in Spain was also formed in 1936, as an electoral alliance of Socialists and Radicals on the basis of a common program and won an election victory similar to that of the *Front Populaire* in France. But in Spain this gave the signal for General Franco's armed rising.

In Great Britain, the movement for a Popular Front has not

been officially accepted by any of the parties, though many individuals in the Liberal and Labour Parties are sympathetic to the idea. It is distinct from, though not necessarily antagonistic to, the movement for a United Front between the Labour and Communist Parties (*see* LABOUR PARTY). In a few constituencies (Chertsey, Stroud, North Oxfordshire) local Popular Front candidates have been adopted by the local Liberal and Labour organizations, but have so far been disavowed by the Labour Party head office. In general, British advocates of the Popular Front take the view that, for the present, the best method of furthering it is collaboration between members of the "Left" parties on particular issues (Spain, China, Collective Security, the Means Test, nutrition policy), leaving over for the future the question of electoral collaboration. The Labour Party, hopeful of winning an independent majority for itself, is suspicious of any proposal for electoral collaboration with either Liberals or Communists. The Next Five Years Group, which includes progressive Conservatives as well as Liberals and Socialists, and Mr. Lloyd George's Council of Action are not committed to the idea of the Popular Front, but tend in the same direction in matters of policy at home and abroad. (*See also* FRANCE; LABOUR.) (G. D. H. C.)

**Popular Songs:** *see* SONGS, POPULAR.

**Population, Movements of.** In 1770 the earth was inhabited by about 800,000,000 people, of whom 155,000,000 were white. The earth is inhabited by about 2,100 millions, of whom 730,000,000 are white. The proportion of whites has thus increased from barely one-fifth to fully one-third. The enormous growth of the whites was due to a reduction of mortality. But their growth has slowed down in recent years, because fertility has declined more than has mortality.

The usual method of establishing a balance of births and deaths consists in deducting the death-rate from the birth-rate. But this computation does not take account of the age composition, and if the age composition—as is the case, for example, in the countries of Western civilization—tends to swell the birth-rate and to reduce the death-rate, the error is bound to be cumulative. The best method of establishing the balance of births and deaths consists in computing the net reproduction-rate, which shows (on the basis of present fertility and mortality) the average number of girls that will be born to a newly-born girl in the course of her life, or, what amounts to the same, the average number of future mothers born to a mother of today.

Prior to the World War, the net reproduction-rate exceeded unity in every country of Europe except France. At present the rate is below one in all countries of western and northern Europe, with the exception of Holland and the Irish Free State; it is likewise below one in Czechoslovakia, Hungary, Finland, Latvia, the United States, Australia, and New Zealand. It is below 0.8 in England, Norway, Sweden, Belgium, France, Switzerland, Austria, and Estonia.

The only European countries in which it is above 1.2 are Portugal, the Balkan States, and Soviet Russia.

In western and northern Europe as a whole, the net reproduction-rate dropped from 1.3 in the 1880's to 0.8 in 1933-36. In central and southern Europe as a whole it still is about 1.15. For the whites as a whole it may also be around 1.15; but excluding Soviet Russia, it probably has not been above unity since 1932. For the white population of the British empire it was probably below 0.9 in 1933-36. (*See also* BIRTH STATISTICS.)

**Immigration and Emigration Statistics.**—Overseas migration on a large scale has occurred only from Africa and Europe to America. The negro slaves imported into America numbered

*Trend of Net Reproduction-rates, 1895-1935*

at least 15 millions. The Europeans who have immigrated into America and have not returned total nearly 40 millions. On the other hand, the number of permanent European immigrants into Australia and New Zealand has been, up till now, only about 2,800,000. Of the net overseas emigration of Europeans since 1492, amounting to about 45 millions, something like 24 millions went to the United States, 15 millions to other parts of America, and 6 millions to other continents.

For the British empire the balance of external migration, as a rule, was unfavourable. The empire, it is true, gained by emigration from continental Europe (to England, Canada, etc.), but this gain was offset by emigration from the British Isles and Canada to the United States.

In recent years emigration from the British empire to the United States has declined much more than immigration into the empire from continental Europe. As a consequence thereof the empire's balance of migration became favourable. England between July 1, 1931, and June 30, 1936, had a net immigration of about 270,000.

On the other hand, some countries which usually have a favourable balance of migration witnessed in recent years an excess of

IMMIGRATION AND EMIGRATION 1928-1937, United States of America. (Figures are for fiscal years ended June 30)

emigration over immigration. The United States between July 1, 1930, and June 30, 1937, had a net emigration of about 280,000. France in the quinquennial period ending March 8, 1936, had a net emigration of about 100,000.

The greatest continental migration of modern times, the peopling of Asiatic Russia with Europeans, has not yet come to an end. The same holds true of the emigration of German Jews which started in 1933.

(R. R. K.)

**Populations of the Countries of the World:** see AREAS AND POPULATIONS OF THE COUNTRIES OF THE WORLD.

## Porto Rico

(PUERTO RICO), a United States insular dependency in the West Indies; languages, English and Spanish; capital, San Juan; governor, Gen. Blanton Winship. The area is 3,435 sq.mi.; the population by the census of 1935 was 1,723,534. In 1930, 25.7% of the population was negro. The chief cities (with est. pop. in 1935) are: San Juan, 137,215; Ponce, 60,867; Mayagüez, 44,907.

**History.**—Porto Rico is administered by a governor appointed by the President of the United States, and an elected bicameral legislature. The Fourteenth Legislature, meeting from February to April 1937, enacted laws to enable Porto Rico to receive benefits of Federal educational, and social legislation, and for co-operation with the Porto Rico Reconstruction Administration.

Of more general nature were a Fair Trade Act and four acts embodying provisions on birth control, which were subjected to bitter opposition, especially on the part of the Roman Catholic Church.

The outstanding features of the year's history were the political unrest, arising from dissatisfaction with the island's political status, and the striking economic improvement shown during the year. Political turmoil, which had begun in 1936 with the militant Nationalist (minority) Party agitation for independence, continued in 1937. On March 21, nineteen persons were killed and over 100 wounded in rioting which followed police efforts to prevent a Nationalist parade at Ponce. An independent investigation by the American Civil Liberties Union placed responsibility on the police. The Ponce incident was followed by formal Nationalist demands for a plebiscite on independence, while the majority coalition party urged statehood. In June, ten Nationalists were arrested, charged with conspiring to murder a United States judge. By the close of the year, however, the high feeling had subsided for the time at least.

Economically, Porto Rico showed marked progress during the year; the insular Government, co-operating with Federal agencies, particularly the Porto Rico Reconstruction Administration, pushed a comprehensive rehabilitation program, whose chief aims were industrial diversification and rural resettlement, in order to relieve the serious unemployment and to reduce the island's de-

pendence upon sugar as a crop. New industries were furthered, and agricultural experimentation undertaken, notably in tropical plants, as vanilla and quinine, which can find a ready market in the United States. Between 50,000 and 60,000 persons were employed in public works construction.

Simultaneous with the rehabilitation program, Porto Rico showed pronounced economic advance, with a total external trade greater than in any but one year since 1920. Revenues reached a record high, and the budget was balanced.

**Trade and Communications.**—Porto Rico has regular steamship communication with the United States and with other parts of the West Indies. Aeroplane service was further improved in 1937 by the installation of night-operating equipment. There are 493kms. of railways, and an extensive highway system of 1,880 kms. of insular roads, supplemented by local roads. In the fiscal year ending June 30, 1937, \$807,504.92 was spent on roads; for the next fiscal year, \$750,000 has been allotted by the U.S. Government to be matched by Porto Rico.

In the fiscal year 1936-37, exports increased 16%, to \$114,953,-827 (98% to the United States). Imports increased 18%, to \$98,875,491 (over 90% from the United States), bringing Porto Rico to sixth place in imports to, and seventh in exports from the continental United States. Sugar comprised 64% of the exports. Imports were both foodstuffs and manufactured articles.

**Agriculture and Manufactures.**—Porto Rico is primarily agricultural, with sugar accounting for 70% of the island's income. Coffee (1937 production: 20,000,000lbs.), chiefly for local consumption, tobacco (1937 production: 27,000,000lbs.), grapefruit, pineapples, and sea island cotton are likewise important. Manufacturing is relatively small, but rum (supplying two-thirds of the U.S. demand), cigars, canned fruit, and fine embroideries are important.

**Finance.**—The monetary unit is the United States dollar. Revenues and expenditures for the year 1936-37 were \$43,379,-340.35 and \$39,641,016.59 respectively. The insular government debt was \$25,778,747.22.

**Education.**—In the year 1936-37, there were 1,711 primary and secondary schools, with an enrolment of 246,868, a decline from the previous year due to withdrawal of Federal aid. The University of Porto Rico, at Las Piedras, had an enrolment of 4,955, a 10.4% increase.

(L. W. BE.)

**Portugal,** republic of Western Europe, member of the League of Nations. Bounded N. and E. by Spain, S. and W. by the Atlantic ocean. Capital, Lisbon. President, General Carmona (re-elected, 1935). National flag, green and red, halved vertically, with arms central.

**Area, Population, and Cities.**—Area (including Azores and Madeira): 35,490 sq.mi.; population: (1930 census) 6,825,883; (1935 estimate) 7,260,000:

Province	Area (sq.mi.)	Population (1930)
Alemtejo (3 districts)	9,219	587,660
Algarve	1,937	300,762
Beiras (5 districts)	9,208	1,734,162
Entre Minho-E-Douro (3 districts)	2,790	1,465,298
Estremadura (4 districts)	6,937	1,833,307
Tras-os-Montes (2 districts)	4,163	439,158
Islands	1,236	465,536

There is religious freedom, but Roman Catholicism is almost universal.

Despite compulsory education (since 1911), nearly a third of the people were illiterate (1930). Education figures for 1934-35: elementary pupils, 468,940; secondary, 18,621; in Lisbon, Oporto

and Coimbra universities, 6,476. Principal towns (1930): Lisbon (594,390); Oporto (232,280); three others exceeded 15,000.

**History.**—A new constitution of 1933 established a dictatorship on a corporative basis. The president is elected for seven years by direct male and limited female adult suffrage. There is a single-chamber national assembly (90, elected for four years; nominees of the National Union, which supports the premier-dictator, Dr. A. de O. Salazar), with a parallel corporative council. A privy council (10; appointed 1936) assists the president.

Incidents of the year at home included a great gale (late January) which wrought widespread havoc; the signature of an agreement (April) with Pan American and Imperial Airways for exploratory trans-Atlantic flights via the Azores; and the escape, unharmed, (July) of Dr. Salazar from attempted assassination by a bomb when entering a Lisbon church.

The Spanish war has naturally been a leading concern. A strict neutrality was maintained, enlistment in Spanish forces being banned (February). But previously Portugal had sent a note to Great Britain criticizing the closing of the Spanish frontier, and in June announced a reservation of attitude towards foreign observers, not uninfluenced by the withdrawal of Italy and Germany from the non-intervention scheme. Portugal has herself been re-arming with machine-guns from Italy and rifles from Germany. In August a rupture of diplomatic relations occurred with Czechoslovakia over the non-fulfilment of a contract to deliver machine-guns to Portugal. Portugal alleged that their export was withheld under pressure by Russia, an allegation denied by Czechoslovakia.

**Trade, Communications, and Finance.**—One-quarter of the land is waste; over one-third is under cereals; over 6% under fruit, and over 5% under vines; over one-quarter is forest (producing timber, cork, resin, and turpentine for export). After wine, fishing (especially for sardines) is the most important industry. Minerals await exploitation. Manufactures (textiles, etc.) are of minor importance. Trade figures (1935): imports, 2,294,949,800 escudos (£20,863,120; a considerable rise); exports, 923,724,300 escudos (£8,397,500); a small rise. Great Britain takes rather less than one-quarter (chiefly wine).

Mercantile marine (1935): 180 steam vessels (228,393 tons); railway mileage: 2,157 (449, narrow gauge); road mileage: 14,539. The State-owned telegraph and telephone systems are small, but a commercial telephone company serves the chief towns. There are 46 radio stations.

The currency unit is the *escudo* (at par, 110 escudos = £1 = \$4.87). The Bank of Portugal alone issues currency: notes in circulation (30% covered), 2,199,309,000 escudos (1936). Savings deposits (1935): 2,550,309,572 escudos.

Budget estimate (1937): revenue, 2,424,276,000 escudos; expenditure, 2,420,682,000 escudos. Total public debt (1936): £59,917,669.

**Defence Forces.**—Military service is compulsory. The army had (1936) 3,146 officers and 24,000 other ranks; air force, 95 machines; naval air service, 28. The navy (in 1935, 1,264 officers and N.C.O's., and 5,509 other ranks) has 7 sloops, 6 destroyers and 3 submarines. Military estimate (1935-36): 403,200,000 escudos.

**BIBLIOGRAPHY.**—A. Ferro-Salazar, *Le Portugal et son Chef* (Paris, 1934); Léon de Poncins, *Le Portugal Renait* (Paris, 1936).

(H. Fw.)

**Portuguese East Africa:** see MOZAMBIQUE.

**Portuguese Guinea,** a Portuguese colony on the west coast of Africa, situated 12° N. and 15° W., bounded N., E., and S.E. by French Guinea. The capital is

Bolama. The area is 13,944 sq.mi., and the population (1933) 416,028. Imports and exports for 1936 were valued at £302,853 and £353,820 respectively; and the estimated revenue and expenditure for 1937 were £248,256 and £245,026 respectively.

The islands of São Tomé and Príncipe, some 125mi. off the coast in the Gulf of Guinea, form a separate Portuguese province. Their area is 384 sq.mi., and the estimated population is 59,055, of whom over 50,000 are in São Tomé. There is a 10mi. railway in São Tomé. Imports and exports (1935) were valued at £168,370 and £289,420 respectively, and estimated revenue and expenditure for 1937 were balanced at £88,400.

**Portuguese West Africa:** see ANGOLA.

**Postal Savings:** see SAVINGS BANKS.

**Post Office.** The audited revenues of the Post Office Department for the fiscal year ended June 30, 1937, amounted to \$726,201,109.89, which was the largest in the history of this service, exceeding by more than \$20,000,000 the previous banner year of 1930. The increase over the previous fiscal year amounted to 9.8%. Of the total income, \$643,561,093 or over 88% was from postage.

The audited expenditures for the department during the fiscal year were \$772,815,842.22, leaving a gross deficit which includes various non-postal items such as franked mail, air mail and Merchant Marine subsidies, penalty mail, and publications free in county, of \$46,614,732.33. Deducting all these non-postal items which total \$59,258,471.37, as authorized by Act of June 9, 1930, leaves a net postal surplus for services rendered for hire of \$12,643,739.04. This was the third net postal surplus during the past four years.

In addition to its customary functions, the Post Office Department has performed many other important public duties, including the distribution of Adjusted Service Bonds to veterans, the registration of approximately 33,000,000 persons under the Social Security Act, the collection of much of the data relating to the recent census on unemployment, and the sale of U.S. Savings Bonds in the amount of \$412,000,000.

**Air Mail.**—During the year both domestic and foreign air mail services have shown a tremendous growth. At the end of the calendar year the aggregate length of all domestic air mail routes was 31,991mi., within 9mi. of the statutory limit in effect on Dec. 31, 1937, and representing an increase of approximately 2,500mi. during the period. A total of 19,553,000lbs. of air mail was transported during the fiscal year, as compared to 15,377,000lbs. during the fiscal year 1936. The revenues during the same period increased from \$9,702,000 to \$12,439,000. While no new routes were established within the fiscal year, several extensions were made and the frequency of schedules on important routes was increased.

There was a substantial growth in the amount of mails carried by air to foreign countries, amounting to 41.8% in mails dispatched and 30.1% in mails received. Thirty thousand route miles are now embraced in the foreign air mail service, over which 4,445,591 miles were flown during the fiscal year. Service on the trans-Pacific route beyond Manila to Macao and Hongkong was inaugurated April 21, 1937.

An average of approximately 400lbs. of air mail is being handled on the trans-Pacific route in each direction.

During the fiscal year 1937, 326 new and additional Federal buildings were occupied, 26 extensions to existing buildings completed, and 24 new Federal buildings replaced a like number of old buildings which had become inadequate for Government purpose.

Nearly 400,000 people earn their living in the postal service,

of which something more than 250,000 are regularly employed.  
(H. BH.)

**Great Britain.**—The postal service in Great Britain includes much more than that of the United States; for in addition to handling letters and parcels by air and land, accepting postal savings accounts and handling money orders, the British department also has charge of express, telephone and telegraph facilities. For the fiscal year ending March 31, 1937, the British post office handled 49,253,000 inland telegrams, 9,238,000 international telegrams, 98,965,000 long distance inland telephone calls, 1,739,000 international calls and 1,881,600,000 local calls. The increased activity responsible for these figures was also evident in the more strictly postal business. Letters carried jumped from 7,345,000,000 to 7,690,000,000 and parcels from 162,208,000 to 174,353,000, but the greatest increase was in the number of letters and parcels sent by air—20,645,000 as compared with 10,792,000 in 1935–36. C.O.D., registered and express services increased similarly.

While the total post office business expanded from £901,000,000 to £962,000,000 during 1936–37, there was a slight reduction in profit. The postal branch raised its income 4.81% with only a .42% increase in expenditure, but expenses in both the telephone and telegraph services rose more rapidly than income and caused total profits to fall from £17,913,078 to £17,765,037. Of the total operating income of £84,139,651, the postal service brought £50,045,019; the telephone, £30,747,173; and the telegraph, £3,700,046. Operating expenses were £38,594,923, £23,604,010, and £4,528,268 respectively. Capital expenditures of £13,597,808, devoted largely to telephone development, were the largest in history exceeding the £11,902,129 spent in 1926. Of total British savings of approximately £2,800,000,000, nearly one-half were handled by the post office with 27,476,000 depositors making new deposits of £128,156,221 for a total of £528,385,603 postal savings deposits and £25,851,000 of national savings certificates being issued to make a total of nearly £500,000,000.

The outstanding innovation in the British postal service during 1937 was the expansion of the imperial air service. A fifteen-year contract signed in June with Imperial Airways provided for subsidies for carrying a maximum amount of mail during the period on regular schedules. By increasing night flying, the department hoped to reduce the time of the Australian service to seven days and of the South African to four. Provision that all first-class mail must be transmitted by air at the rate of 1½d. per half-ounce (double the former rate by steamer—1½d. per ounce) marks a revolution in air transport and mail service. The first service to be initiated under this arrangement was the South African which was inaugurated in late June and which soon was carrying loads ten times heavier than earlier in the year. Experience gained on the African route was of assistance in arranging similar service to India and Australia, the Indian-Malayan service being started on Feb. 23, 1938 with the Australian service projected for early summer.

**Post Office Department:** see GOVERNMENT DEPARTMENTS AND BUREAUS.

**Potash.** The crude potassium salts output of the world is almost exclusively the chloride or sulphate, with a small proportion of nitrate and carbonate, produced primarily for fertilizer use; only a very small amount goes into industrial chemicals, and even in the United States, where the industrial demand is probably higher than in any other country, with the possible exception of Germany, the chemical salts comprise only about 20% of the total. World production decreased from 2,800,000 metric tons of K<sub>2</sub>O equivalent in 1929 to 1,400,000 tons in 1932,

increasing to 2,400,000 tons in 1936, distributed as follows: Germany 60%, France 15%, United States 9%, Soviet Union 8%, Poland 4%, and Spain 3%; half of the remaining 1% comes from Palestine, and the other half from several still smaller sources.

The production of potash in the United States was a World War development that has been growing steadily since the post-War slump. From a typical "war baby" with 128 plants turning out 49,700 metric tons of K<sub>2</sub>O equivalent in 1918, it shrank to 20 plants and 9,200 tons in 1921; as the emergency supply phase shifted to substantial commercial development, the plants still further decreased in number, and their capacity increased; in 1929 five plants produced 55,900 tons, and expansion continued throughout the depression with practically no break; 10 plants produced 174,900 tons in 1935, and seven plants turned out 224,400 tons in 1936. In spite of this heavy increase in production the demand far exceeds the supply, and imports are still almost as large as production. The peak of imports was 326,000 tons in 1930, but only 221,000 tons in 1935, and 186,000 tons in 1936.

(G. A. Ro.)

**Potatoes.** The 1937 potato crop in 21 principal producing countries was 5,103,796,000bu., as estimated by the International Institute of Agriculture. This figure does not include Russia. There are no reliable data for U.S.S.R. production, but indications are that the good potato crop there may exceed Russia's known average annual yield of 1,895,743,000bu. for the five years ending in 1935. Nor does the Institute's total include France, where the 1937 crop approximated the 1936 production of 560,367,000 bushels. Argentina, which produces about 28,000,000bu. annually, and Belgium with an average crop of about 132,000,000bu. are also omitted as is the Irish Free State where the crop last year was almost the same as in 1936, or about 90,000,000 bushels. Including these and several smaller omissions, the 1937 crop totalled well above 8,000,000,000 bushels.

The Institute's total, however, is the record production for the last 15 years. In 19 countries in Europe the combined crop was 4,640,741,000bu. in 1937 and 4,128,761,000 in 1936. In Canada 71,055,000bu. (65,059,000)—figures in parentheses indicate 1936 production—and a five-year (1931–35) average of 73,744,000 bushels. The United States crop in 1937 was 391,159,000bu. (331,918,000), with a five-year average of 379,068,000 bushels.

Germany's record production of 1,950,388,000bu. led all known returns for the 1937 crop, which in the Reich exceeded both the 1936 yield of 1,702,062,000bu. and the five-year average of 1,636,908,000 bushels. The second largest crop, excluding the unrevealed Russian production, was that of Poland, with 1,388,889,000bu. in 1937, compared to 1,259,601,000 in 1936 and a five-year average of 1,140,984,000. Czechoslovakian production of 397,428,000bu. also exceeded both the 1936 figures of 393,215,000bu. and the five-year average of 326,687,000 bushels. But in England and Wales, while the 1937 crop of 110,992,000bu. bettered the 105,056,000 figures of 1936, production was less than the five-year average of 116,166,000 bushels.

Other principal countries reported by the Institute include: Italy, 110,229,000bu. (1937), 96,667,000 (1936), and 88,524,000 (five-year average). Austria, 102,399,000 (1937), 87,032,000 (1936), and 94,648,000 (five-year average). Hungary, 95,497,000 (1937), 90,068,000 (1936), and 61,522,000 (five-year average). Lithuania, 92,196,000 (1937), 76,250,000 (1936), and 73,532,000 (five-year average). Netherlands, 91,858,000 (1937), 92,099,000 (1936), and 111,113,000 (five-year average). Sweden, 64,925,000 (1937), 67,098,000 (1936), and 68,753,000 (five-year average). Scotland, 33,413,000 (1937), 36,960,000 (1936), and 36,057,000 (five-year average). For the United States yields averaged 123.1bu. to the acre, and in Idaho a yield of 240bu. to the acre is

the second largest on record. (See also AGRICULTURE: *Technical Developments*; MARKETING BOARDS.) (S. O. R.)

**Poultry.** Figures representing the economic place of poultry in the world are almost startling in their breadth. There were, for example, 387,251,000 chickens on U.S. farms at the end of 1937 and they had a value of \$292,650,000, as estimated by the U.S. Department of Agriculture. In England and Wales the poultry census for 1937, with 1936 figures in parentheses, was, chickens 57,555,000 (57,744,000), ducks 2,281,000 (2,606,000), geese 552,000 (634,000), turkeys 687,000 (707,000); in Canada, chickens 53,982,000 (55,769,000), turkeys 1,997,900 (2,044,700), geese 874,900 (854,900), ducks 654,400 (670,500); in Scotland, chickens 7,300,000 (7,954,500), geese 241,600 (261,100), ducks 217,000 (236,000), turkeys 117,100 (96,800); in Northern Ireland, chickens 9,219,600 (9,542,700), ducks 428,000 (498,700), turkeys 420,300 (389,300), geese 116,600 (139,000).

In round numbers the U.S. poultry industry produces approximately 30,000,000,000 eggs, nearly 400,000,000 chickens, between 15,000,000 and 20,000,000 turkeys, about 10,000,000 ducks, 4,000,000 geese annually, including more than 15,000,000 broilers. Receipts of dressed poultry in 1937 at the four principal markets, New York, Chicago, Philadelphia, and Boston were 328,489,748 lbs. compared to 353,577,183 lbs. in 1936. In addition there is a large trade in live poultry, with specially-built railroad cars for transporting live fowls and with thousands of crates of live birds sent by truck and rail to the large markets, particularly New York.

The number of chickens on U.S. farms in 1937 showed a decline of 7.9% from 420,257,000 in 1936 and represented probably the smallest flocks since 1922. Prices were disappointing and the year ending October 31 recorded the lowest margin over feed cost per fowl in many years. Turkeys in 1937 numbered about 10% under the 20,000,000 in 1936.

In the annual contest held yearly at the convention of Future Farmers of America, in connection with the American Royal Live Stock Show in Kansas City, Mo., teams of young men from 25 States competed in judging poultry. The trophy offered by the Institute of American Poultry Industries for excellence in grading market poultry was won by Robert Mason and Harold Rinehart of Alleman, Iowa. Second prize was won by Melvin Acquistapace and Richard Gray of Santa Rosa, Calif.

The success of 24 co-operative poultry auctions, which numbered 12,000 poultry and egg producers in their memberships, was pointed out by the U.S. Department of Agriculture. These associations are made up of producers near Boston, New York, Philadelphia, and other eastern cities, who found that Pacific coast and western co-operatives were selling more profitably in eastern cities than the local producers. By providing a steady source of supply in their auction markets the eastern associations were able to reduce the spread between local and city markets.

The World Poultry Congress will hold its seventh triennial convention in Cleveland, Ohio, July 25 to Aug. 7, 1939, with six nations represented. The congress met in Berlin in 1936.

**Presbyterian Church.** The Reformed Churches holding the Presbyterian System, located within the U.S.A., are twelve in number and include 22,420 ministers, 22,503 churches, and 4,474,029 communicant members. Outside of continental United States, they have 2,211 American foreign missionaries and 12,800 native agents in a total of 21

countries, and with a communicant membership of 239,258.

Due largely to the influence of the great ecumenical conferences held in Great Britain in the summer of 1937, there are definite evidences of a desire for closer relationships among the Presbyterian Churches in the United States. It is likely that negotiations will shortly be initiated between the Presbyterian Church in the United States of America and the Presbyterian Church in the United States (Southern), looking to the reunion of these two communions which once were one and that the efforts so active a few years ago, looking to the union of the United Presbyterian Church of North America and the Presbyterian Church in the United States of America, will be renewed.

That new venture of Christian faith, the Evangelical and Reformed Church which was initiated in 1934 by the merging of the Reformed Church of the United States and the Evangelical Synod of North America, has been advanced by the adoption by the General Synod of a constitution and by-laws and their submission to the constituent districts and classes for study and future report.

The Presbyterian Church in the United States (Southern) is now engaged in raising a three-million-dollar "Accrued Liability Fund," in order that its Ministers' Annuity Fund may be put in operation. The Reformed Church in America has carried on a campaign for "greater things" which resulted in the raising of \$555,000 for benevolent purposes, or \$24,000 more than the projected budget.

The Presbyterian Church in the United States of America reports marked increases during the year 1937 in communicant membership and in gifts for current expenses and benevolences. At the last meeting of its General Assembly, it appointed a committee to study and to suggest amendments to the portions of its Constitution which are concerned with the relations of church and State. A committee which has been studying the problem of adequate ministerial compensation throughout the church is also continuing its work. Altogether, the year has been one of satisfactory advancement among the members of the Presbyterian family.

(L. S. Mu.)

**British Empire.**—Known as the Reformed Churches holding the Presbyterian System, there are some 36 separate churches or sub-divisions on the continent of Europe, with 3,016,201 communicants and 9,767,680 baptized persons, not counting Russia, for which country there are no returns.

In the British Isles, there are 10 of these churches, of which the following have the largest membership: the Church of Scotland, 1,288,648 communicants and 432,453 pupils in Sunday schools and Bible classes; the Presbyterian Church of Wales, 182,221 and 128,970, respectively; the Presbyterian Church in Ireland, 113,811 and 94,962; the Presbyterian Church of England, 81,715 and 46,474, and the United Free Church of Scotland, 21,826 and 11,336.

In Asia, there are 16 distinct churches, including the Church of Christ in China (123,043 communicants) and the Presbyterian Church in Korea (109,044), with a total communicant membership of 597,931 and 693,477 on the Sunday school registers. In Africa, including the Dutch Reformed Church in South Africa with 340,993 communicants, there are 17 churches having a communicant membership of 726,594. In North America 18 churches have a membership of 4,479,864; in South America there are 12 churches, and in the West Indies, four. In Australasia, the Presbyterian Church of Australia, the Free Presbyterian Church of Australia, and the Presbyterian Church of New Zealand, with a missionary synod in the New Hebrides and French churches in Oceania, have 106,252 communicant members and 131,128 Sunday school and Bible class pupils.

Taken altogether, the Reformed Churches of the world had in 1937, 10,714,366 communicants, an increase of 799,203 since

1933; and 21,628,577 baptized persons, an increase of 277,062 in four years. Of Sunday school members, there were 6,312,481, a decrease of about 100,000 in four years.

The 15th Quadrennial Council of the General Presbyterian Alliance was held with great success at Montreal, Canada, in June 1937, representative through their delegates of some 50 million Presbyterians scattered about the globe. The president was Dr. W. A. Curtis, principal of New college, Edinburgh, and the troubled situation of many Reformed Churches in Europe and in Manchuria gave great concern to the Council.

**Prices, Statistics of.** Preliminary to any discussion of the trend of prices during the year 1937, some consideration must be given to the changes which took place in the 13 preceding years. The year 1924 is generally regarded as a satisfactory starting-point for the real post-War period, 1919-24 being reckoned as a period of adjustment during which the economic machinery of the world was submitted to extensive overhauls for repairs and renewals.

The table below shows the course of prices in some of the more important countries.

The six years 1924-29 witnessed a fairly considerable expansion in demand for raw materials and foods. The organization of production was more than sufficient for this expansion, and the tendency of prices was downwards. During this period in Great Britain, there was a great deal of unemployment; the number of insured workpeople recorded as unemployed monthly never fell below the million mark in 1929, and opinion at the time inclined to the view that the country was going through the slow process of recovery from the post-War slump. It was only later, when the experience of the conditions of 1930 and 1931 were available for comparison, that recognition came of the comparative boom-like conditions of 1928 and 1929.

With the general falling-off in 1930 of demand for basic commodities, the catastrophic decline in prices set in, accelerated by the size of accumulated stocks. This very sudden drop to pre-War levels and below, shown in the table, was regarded with great concern in producing countries. In the autumn of 1931, the Gold Standard was suspended in London; in the spring of 1933, it was suspended in the United States. Demand began to increase again in 1932-33. Nearly all basic commodities are now subject to some kind of control of output. By 1936, the demand for com-

modities and foodstuffs had reached a high level, and the consequent rise in prices was beginning to attract attention. Suggestions were made that perhaps prices were rising too quickly. The price of wheat in the United States was just about double what it was in 1932, rubber at 3d. per lb. in England in 1931 was 7½d. per lb. in 1936. Old stocks were becoming exhausted, and the way was free for a boom in prices.

**United States.—Food Prices, Wholesale.**—In recent years, the general trend of wholesale prices of foods was upwards from 1933 to 1935, 1936 was a year of slight recession, and in 1937 the general level was higher than in 1936 and 1935. But in the last quarter of 1937, there was a comparatively rapid fall. Whereas in 1936 the index of the Department of Labor rose from 83.3 in September to 85.5 in December, in 1937 the index fell from 88.0 in September to 79.8 in December. In the table above, the price indices for foods are given in detail.

The higher level in 1937 of the food index is mainly attributable to the very high level reached by the meat index, which stood at 113.4 in September, having risen to that level from the beginning of the year. Since September, the meat index has receded to a figure of the same order as those for the earlier months. The average figure for dairy products in 1937 was lower than in 1936, while that for cereals was somewhat higher, and this was also the case for fruits and vegetables. In this case, the movement of the index during the year was very different from that in 1936. In 1937, the general level was fairly steady at about 85, for the first six months, after which came a sudden drop to a level of 60 at the end of the year. In 1936, on the other hand, the index rose sharply from 62 in January and February to 82 in June, after which it fell to 72 in September, and then rose to 75 in December.

**Food Prices, Retail.**—The general trend of retail prices indicated by the Department of Labor index of retail costs of food has been upwards since 1933. The figure for 1936 was 82.1, that for 1937 was 85.1. Since Sept. 1937, there has been a rather sharp falling off from 85.8 to 82.6 in December. The index was higher for each month than for the corresponding period of 1936 up to November, but the December figure was lower than that for December 1936. The detailed figures are given in the first table on the next page.

The meats index shows the same kind of movements during the year as was noted with the wholesale price index. It rose from 95 at the beginning of the year to 111.6 in August and 111.4 in September, since when it has shown a fairly rapid decline. The cereals figure has moved little during the year, but it has been,

apart from the month of January, above the 1936 level. The dairy figure again follows the movements in the wholesale index, but not with such amplitude, and the general level has been above that of 1936. The fruits and vegetables index has moved during 1937 in a similar fashion to the wholesale index, being high in the first half of the year, and then declining to a much lower level towards the end of the year. The average for 1937 is not substantially different from that of 1936. Of the other constituents of the index, that for eggs follows much the same course as in 1936, and the general level is hardly changed. The index for beverages and chocolates has not altered much during the year, but has been consistently above the figure for 1936 by about 3 points. Similarly, the movements in the series for fats and oils, and sugar and sweets have been slight during 1937, and the general average for the year in each case is above that for 1936.

**Great Britain.**—The general level of food prices during 1937 was higher than in 1936, though the increases recorded have not been as spectacular as those of materials, the maximum figure in October of 1937 being 15% above the 1936 level. The higher level is mainly accounted for by the substantial rise in cereal prices. These have been 20-30% above the 1936 level throughout

the year. The meat figures have shown a fairly steady increase during the year, the general level being some 6% above that for 1936. The other food and tobacco figure shows a rise for the year of about 4% above 1936. An interesting fact to be noted is that, whereas the year 1937 as a whole shows very little change as compared with 1930, the base year of the index, the cereal figure has increased considerably, some 25-30%, while the meat figure has declined by more than 10%, the other figure being very little changed as regards general level. The substantial rise in cereal prices in the past few years will have repercussions in the cost of living index.

In the last column of the second table on this page, there is shown the wholesale price index for all commodities and foods. This, of course, shows that prices on the whole have been throughout 1937 at a higher level than in 1936, but that a maximum was reached in July 1937, since when the general level has declined. The changes noted here are more than can reasonably be accounted for by seasonal movements.

**Retail Prices and Cost of Living.**—During 1937, the Ministry of Labour cost of living index increased from 51 in January to 60 in December, each figure representing a percentage increase above July 1914. The index had fallen to the record low post-War figure of 40 in 1933, and from that year had been slowly rising to 47 in 1936. The average figure for 1937 is 54; thus there has been a rapid rise of 7 points from 1936 to 1937, compared with the slower rise of 7 points from 1933 to 1936. This acceleration in the rate of increase of this figure is mainly accounted for by the rapid rise in food prices (retail) between 1936 and 1937. The index for food alone was 20% above 1914 in 1933, the year of lowest prices, and had increased gradually to 30 in 1936, but from that level it jumped to 39 in 1937. During the year, the only other constituent of the cost of living index to show a rise comparable with that of food was the index for clothing, which was taken as "between 90-95" in January, and "about 110" in December, both these figures again representing increases above July 1914.

During 1937 the wage index of the London and Cambridge Economic Service rose to 100½ from 97½ in 1936, having been 94 in 1933, (1924=100). Thus to compensate for a rise of about 7% in food prices from 1936 to 1937, there was a rise in the wage index of about 3%.

The rise in the cost of living index from 1936 to 1937 was about 5% (from 147 to 154).

On the average, the index of volume of retail sales of food for 1937 compared with 1936 appears to be 102. We may therefore reasonably assert with some confidence that the total volume of retail sales of food in Great Britain has increased from 1936 to 1937 by about 2%. But, according to the Ministry of Labour's estimates of the amount of employment amongst insured workers, it would appear that the total volume of potential consumers has increased between 1936 and 1937 by about 5½% (from about 10.9 millions to about 11.5 millions). These figures certainly suggest that the consumption per head on the average has declined from 1936 to 1937, and are in accord with the figures previously given where a comparison was made between the rise in the food price index and that of wages. (See also COST OF LIVING.)

owned by the occupiers. The population, census 1931, was 88,038; estimated for Jan. 1, 1938, 93,000, of which 81% was rural; 80% of British descent; 14% French; 41% are Roman Catholics; 17% Presbyterians; 28% United Church; 6% Anglicans. Capital, Charlottetown, 12,361. The government is constitutional, but the House of Assembly is of one mind; there are no parties. It is the last refuge of prohibition. Lieut.-Governor DeBlois, Premier Thane A. Campbell, and Chief-Justice Mathieson are the principal officers. Education as at June 30, 1937, absorbed \$543,109 for 18,183 enrolled pupils, with average attendance of 72%; cost per pupil \$38.30; teachers 657; average salary \$531. The Prince of Wales college has 504 students.

To Dec. 30, 1937, the official estimate of the revenue was \$1,799,816; the expenditure \$1,863,104, of which interest absorbed \$277,000, sinking fund \$154,000, roads \$220,000. The public debt at the same date was \$5,437,268, per caput \$58; the yearly tax \$20 for provincial expenditure. There is a moderate income and succession tax. The Dominion subsidy was \$647,181. Agriculture, the principal occupation, yielded in 1937: potatoes 5,500,000 bushels, 150 per acre; turnips, 4,500,000; oats 4,500,000; wheat 314,000; hay and clover 377,000 tons. To Sept. 30 only, the yield of butter was 1,764,309 pounds; of cheese, 426,648. The returns for 1937 not being complete, the statement as at Nov. 1st discloses fisheries at \$683,157; oysters 861,800 pounds; fox pelts estimated 70,000 to yield 2 million dollars. The net value of agricultural production \$11,725,908 varies little from year to year.

(A. MAC.)

**Princeton University.** Convinced that the survival of private colleges depends in large measure upon their ability to justify their right to exist, Princeton University during 1937—the 190th year of its existence—continued to broaden the scope of its research activities. In addition to its scientific program which since the days of Joseph Henry's discoveries in electromagnetism has contributed to the progress of civilization, Princeton augmented the projects conducted by its School of Public and International Affairs in political and social fields. Researches in the problems of population and the influence of the radio were added to its study of public opinion and its survey of local government in New Jersey.

Working toward the goal of self-education, Princeton developed its program of individual instruction, giving further recognition to differences in need and aptitude of undergraduates. Having previously, through the medium of the School of Public and International Affairs, co-ordinated certain work in economics, history and politics, it inaugurated a plan of integration in the humanities. Gifts received totalled \$872,465. Its enrolment, which is controlled by a policy of limitation, was the largest in history, totalling 2,665, of which 277 were graduate students. The teaching staff numbered 382.

(H. W. Do.)

**Principe:** see PORTUGUESE GUINEA.

**Printing.** Contributions of scientific research probably constitute the major developments in the printing field during 1937, and these most likely were the culmination of previous intensive study. The recent years of economic turmoil have brought scientific research more to the forefront, and wider recognition is given the necessity of subjecting all factors entering into the production of printed matter to the test-tube analysis of the laboratory.

Manufacturers of machinery and equipment have made their contributions through improvements leading to greater speed, ease and convenience of operation. Scientific research has added new materials having a marked effect and leading to greater pos-

sibilities for the future. The whole trend has been toward the one aim of shortening the time between the completion of written manuscript or copy and its appearance in printed form.

One contribution of science was the introduction just prior to the opening of the year 1937 of what is known as "Vaporin," which permits the instantaneous drying of inks, the ink vehicle being instantly vaporized by the application of heat, leaving a relatively dry ink film on the surface of the paper. Paper can be sent through the press at greater speed, and printed sheets can be handled in much less time after they leave the press.

The new enclosed ink fountain, known as the "Weiss Speedry Fountain," has increased the production of colour gravure presses from around 400ft. a minute to from 1200 to 1500ft. a minute, with possibilities for further speed increases and other advantages in production.

Another contribution to the printing field made by chemists is "Neoprene," a rubber-like material used to replace the composition or rubber printing rollers, and having increased wearing qualities as well as greater resistance to the vehicles used in inks and the various types of washes. And a substitute for rubber, called "Buna," used for printing rollers and blankets, and said to be 30% stronger than rubber, was also announced during the year.

Experiments in the field of colour brought out the "Monastal Fast Blue BS," a new insoluble pigment yielding strikingly brilliant shades of blue, and having resistance to most of the severe colour-destroying agencies. First used for printing inks, the colour has been said to meet all the requirements of fine process printing as it is strong and fast, and is outstanding in reproductive quality and beauty. The search for other colour pigments has also been carried on and given greater impetus.

Impetus has been given to the standardization of colours through the announcement of an international colour code which insures uniformity of colours and their varying shades, the code describing and explaining 720 colours and shades, and being designed to eliminate the confusion that has existed between scientists and industrialists of different countries on account of the impossibility of accurately defining various shades of colours. The introduction of commercial models of the "Spectrophotometer," a photo-electric recording device which removes the human element from colour analysis because its action is entirely mechanical and automatic, has also advanced the work of colour matching and standardization, classifying any shade of colour no matter

THIS IS A MODERN TYPE two-web magazine press, made by R. Hoe & Company, equipped with anti-friction bearings throughout. It has a double angle bar folder and is designed to operate at a speed of 34,000 32-page signatures per hour

how delicate.

The advance in colour science and its applications to the field of printing is also indicated by the fact that colour samples, or "Colorgrams," as they are called, were sent by telegraph from one city to another with the aid of the recording photo-electric spectrophotometer, and the new telegraphic facsimile service. The characteristics of the colour are charted by the spectrophotometer on a graph, a copy of the graph being transmitted by means of the facsimile service, thus enabling scientifically accurate colour specifications to be telegraphed in a few minutes to printers, advertisers, or others requiring colour analysis in a hurry. Great progress has been made during the year in the development of colour printing in daily newspapers. The advance in colour photography, and the corresponding advance in the reproduction of colour photographs by photo-engraving, has brought great progress in the use of direct colour photography for illustrating printed matter.

Impetus has been given to the work of accurately determining the visibility and legibility of printing and printing types, the introduction of the visibility metre having made possible a more scientific method of making tests. The problem of producing straight type matter or reading or text matter for offset lithography and gravure printing has been attacked more vigorously, efforts being continued to develop means by which the photographing of proofs of the type, or transferring them, could be eliminated. The outstanding effort along these lines probably is the continued development of the machine known as the "Oro-type," the operation of which is similar to that of an ordinary type composing machine, but which incorporates the use of a printing mechanism by means of which the type is printed, line by line as it is set on the machine, onto a cellophane film. The first impression from the type is made on a rubber blanket, after which the film is brought into position and pressed against the blanket by the type, thus giving the printed impression on both sides of the film and producing a type film, which offers a more direct method of transferring the type matter.

Renewed activity has taken place in the efforts to develop self-aligning or variable-spacing typewriters, by means of which typewritten matter can be properly aligned at both left and right hand sides, permitting of photographing direct from the typewritten copy and thus eliminating the setting of type. Several such typewriters have been developed, and through their use several newspapers printed on the offset press have made their appearance during the year 1937.

Experiments are being made with the use of regular type faces to take the place of the typewriter faces. Greatly increased interest has been taken in printing from rubber plates. Likewise there has been a noteworthy increase in the use of coating processes, such as varnishing, lacquering, and cellucoating, after the sheets are printed, the gloss finish given greatly enhancing the brilliance of colours as well as the varying shades and tones in illustrations. The cutting of matrices for another Oriental type face, the Tamil, is indicative of the steady progress being made toward increasing the use of printing in greater quantities the world over.

(J. L. F.)

**Prisons.** The year 1937 has witnessed some innovations in the conduct of prison life and management. In Great Britain, as the first step in a proposed program to widen privileges generally for the inmates of the country's prisons, Sir Samuel Hoare, the British Home Secretary, has established the regular payment of wages to all convicts for the work they do in prison. It is true that the pay is about two shillings a week and therefore is in no way commensurate with the amount of work done. However, it represents a significant break from tradition in

that the old days of the treadmill, breaking stones, and other unproductive tasks have thus been banished completely from British prison administration. Aside from this important change, current interest in penal matters in England is centred mainly about the construction of new prison institutions.

In the United States, guards in Federal prisons no longer carry clubs; although in some State institutions that weapon and the blackjack are allowed officers working within the walls.

The Governor of the State of Georgia has announced that the penological system of that State will be reorganized thoroughly and that the reorganization presages the doom of the notorious chain gangs.

The program hinges around a newly completed, ultra-modern prison in Tattnall county of that State. Tattnall will be maintained as a proving ground for convicts who will be employed at such trades as manufacturing automobile license plates and covers for school books. Those whose conduct wins approval will be transferred to honour camps where all members will have the status of trustees.

Many changes were introduced into the New York prison system through the findings of the State Commission for the Study of the Educational Problems of Penal Institutions for Youth. The plan is simple and is based upon the assumption that the proper type of education can reduce the tendency to recidivism in released prisoners. Curricula were developed for the different types of State institutions. Experiments in the use of this material were carried on in Clinton prison, Wallkill prison, and in the Elmira reformatory, all in New York State. The old formal method of teaching was discarded and the instruction was made as individual as possible through the adoption of the project method of teaching used in modern schools. This means giving the student a graded series of tasks and promoting him as rapidly as he finishes each one. In this way the individual student is unretarded by laggards. Under the new plan practically every official who comes into contact with the prisoner must be somewhat of an educator. This has led to one of the most progressive innovations of all—the employment of guards with educational backgrounds, or who are especially trained to assist in the educational work. In June, three hundred guards completed a ten-week training course at Wallkill. They are looked upon as the foundation of the new method in all the prisons of the State.

In New York State also, the City of Rochester was authorized by the legislature to impose week-end sentences upon a defendant until he completes the term set by the court. This enables a prisoner to serve his sentence without possible loss of employment.

(L. E. L.)

**Great Britain.**—Great strides were made during the year in ameliorating the life of the convict. Following on the successful experiments at Wakefield and Maidstone, it was decided to institute a system of wages, varying from 3d. to 1s. 7d. per week, for long-term convicts at Dartmoor, Parkhurst, and Chelmsford, the chief feature of the innovation being that it is to operate from the beginning of the sentence.

Other innovations were: the installation of sound-film equipment in the more important prisons for the exhibition of educational and travel pictures, with entertainment films on special occasions; and the general relaxation of smoking regulations. Convicts may now smoke, not only in their cells, but also when doing normal work, whereas formerly only a few were allowed to do so, and then only at set times and places. The system of treating offenders as "clinical cases" was developed during 1937, notably at Wakefield and Wormwood Scrubs, each convict having a medical chart.

Work proceeded with the construction of the new £14,000 Imperial Training college for prison officers at Wakefield. The Home

Secretary also introduced a training course for probation officers, with the aim of making the fullest use of the existing powers for the probation of young first offenders.

**Private Schools.** In both the United States and Canada the term, private school, includes what in England are known both as public schools and private schools. The great "public schools" of England like Eton and Harrow correspond to such privately endowed schools as Exeter and Andover in America. In the United States, "a private school is one dependent on private initiative for its inception and maintenance, not wholly or in part dependent on public taxation." (Sargent, *Handbook of Private Schools*, 1915).

Private and grammar schools in America in colonial times followed English patterns, the American public school being a development of the early 19th century. Not particularly numerous for years after the establishment of public schools, private schools began to increase rapidly in the last years of the 19th century. This process continued until the U.S. Office of Education in 1934-35 listed 9,992 private elementary schools, 3,327 private high or secondary schools, 1,551 private commercial schools, and 972 private or non-tax-supported colleges.

Approximately one-tenth of the children of school age in the United States attend private schools. During the school year, 1935-36, there were 2,638,775 pupils in United States private elementary and secondary schools. Nine-tenths of these students were in parochial schools and 2,251,466 (over 85%) in elementary schools. In the fall of both 1936 and 1937 private schools reported increased registrations with 15% more of the schools filled to capacity in Sept. 1937, than in the previous year.

Canadian private schools had 86,248 students in 1935, an increase over 1934, but otherwise the lowest since 1926. In provinces other than Quebec from 2% to 4% of the school children attended private elementary or secondary schools. In Quebec, however, where the proportion is 10%, most schools receive provincial subsidies and are thus not strictly private schools in the American sense. Canada also has many private business schools, which had an enrolment of 17,398 in 1935. (P. SA.)

**Processing Tax.** The processing tax in the United States was one of the fiscal measures enacted by Congress during the flood-tide of legislation in May 1933. Concisely described, the processing tax was a method of taxing the consumer of food in order to raise money with which to induce the farmer to reduce his output, to the end that the consumer should permanently have to pay a higher price. When it came before the Supreme Court, that tribunal held, on Jan. 6, 1936, that this tax was unconstitutional.

All that remains now of the processing tax is a great mass of controversial litigation over the recovery, by the taxpayer, of the sums previously paid. But in 1935 Congress had passed additional legislation intended to prevent the recovery of the taxes at the event that the law was held unconstitutional. The amount which the treasury actually collected in processing taxes was \$51,000,000; while about \$200,000,000 more was paid into the hands of the courts. In order to enable the treasury to collect at least a major portion of this latter amount, Congress enacted what is popularly known as the "windfall" tax, based on the theory that the taxpayer who had passed the original tax on to others should enjoy "unjust enrichment" if he were to recover that tax afterwards. The taxpayers have attacked the constitutionality of this "windfall" tax, and that question is before the courts today. (See also TAXATION.) (D. F.)

**Profits Tax:** see NATIONAL DEFENCE CONTRIBUTION.

**Progressive Education.** Progressive education has markedly influenced American educational theory and practice toward broadening the concept of the rôle of the school from one of primarily training children in the three R's to one of considering the whole development of the child as an individual and as a member of Society. This concept lays increased emphasis on the fine arts and other forms of self-expression, on mental hygiene and family relationships, and on a study of our changing civilization and the part each member of a democratic society must play in guiding that change. While the spirit and ideas of progressive education have affected schools generally, the organized movement is represented by the Progressive Education Association.

This association during the past year had 10,000 members, and held a national convention, five study institutes, and 18 regional conferences. It has fostered scientific research and the preparation of curricular materials through its various national commissions and committees, as follows:

The Commission on Relation of Secondary School and College has been conducting an eight-year experiment with the collaboration of 30 high schools and most of the colleges and universities of the country to determine whether the freeing of high schools from rigid college-preparatory requirements and allowing them to substitute a freer, broader type of education would hamper the subsequent college work of students.

The Commission on Secondary School Curriculum has conducted research and gathered materials and outlines for the reorganization of high school courses.

The Commission on Human Relations has gathered the findings of an important group of scholars in this field and made them available for classroom use.

The Commission on Educational Freedom has published pamphlets and study outlines to sensitize parents and educators to the importance of protecting educational freedom for teachers and students.

The Commission on Inter-cultural Relations has undertaken the preparation of programs and activities designed to bring about better and more sympathetic understanding among the various social and cultural groups in American communities.

The Committees on Progressive Education in Rural Schools, Community Relations and Education, Experimental Schools, Home and School Relations, and Child Development and the Pre-school and Elementary School Curriculum, have all been engaged in drafting comprehensive programs for research, experimentation, and the preparation of materials in their respective fields.

**Proteins:** see BIOCHEMISTRY: *Proteins*.

**Protestant Episcopal Church.** In the record of the Protestant Episcopal Church in the United States for 1937 two things are especially noteworthy, the general participation of the clergy and laity in the Forward Movement undertaken with the object of stirring and strengthening the faith and spiritual life of the church, and the earnest efforts which have been made, in spite of the unfavourable financial conditions, for the maintenance of the church's missionary work at home and abroad. The Commission on the Forward Movement has printed and circulated millions of copies of its manuals of instruction and devotion and these aids to prayer and worship and Christian living have been widely and eagerly received. The offerings for the missionary work of the church, while still far short of the need, have given evidence of deepened faith and interest.

In Oct. 1937 the Triennial Meeting of the General Convention

was held in Cincinnati, Ohio. The most important action at this convention was the re-organization of the National Council of the church and the election of the Right Reverend Henry St. George Tucker, bishop of Virginia, to the office of presiding bishop. The subject which attracted the greatest attention was a proposal that the bishops should be given power to authorize the clergy to remarry persons divorced by a civil court whatever might be the ground on which the divorce was obtained. This proposal was overwhelmingly rejected.

An event of great historic and religious interest was the observance in New York and Philadelphia of the 150th anniversary of the consecration in Lambeth Chapel, London, of the first bishop of New York, Samuel Provoost, and the first bishop of Pennsylvania, William White, which gave to the church in America the Episcopate in the Anglican line of succession. In August representatives of the Protestant Episcopal Church participated in the Conference on Life and Work held at Oxford and in the Conference on Faith and Order held in Edinburgh. As a result of these conferences a meeting is to be held in Holland in May 1938, to consider plans for the formation of a World Council of Churches. The General Convention in Cincinnati took action providing that representatives of the Episcopal Church shall attend the meeting in Holland and report upon these proposed plans at the next meeting of the General Convention. (W. T. M.)

**Prunes:** see PLUMS AND PRUNES.

**Psychiatry.** The treatment of schizophrenia (dementia praecox) has reoccupied the attention of psychiatric workers because of the new forms of "shock" therapy. The use of gradually increasing doses of insulin causes the patient to become comatose or to have convulsions; remarkable remissions have been reported. After eighteen to twenty of such shocks given over a period of several months, patients are improved and even seem completely cured. Many are discharged from hospitals and asylums and returned to a useful economic existence. Metrazol, which is a camphor derivative, when injected intravenously causes epileptic convulsions. Fifteen or twenty such seizures produce the same effect as insulin shock. Cases most suitable for treatment with shock are those of recent onset; in this group the probability of improvement is between 60% and 80%. There is considerable optimism that the remissions so induced are more permanent than the often appearing spontaneous remissions. The treatment is still empirical since no explanation has yet been found for its spectacular effect.

Psycho-somatic studies have extended and deepened in many fields of medicine. Studies in the psychogenesis of gastro-intestinal diseases, respiratory diseases, arthritis and hypertension have shown that psychologic components in their causation are of extreme importance. These organic diseases it is claimed, may result as the end-product of long-continued disturbances of functions induced by repressed emotions exteriorizing themselves by changes in the vegetative nervous system. Therapy in the early stages when directed to the psychologic cause may prevent the terminal and irreversible organic disease.

Mechanical means of registering brain activity as indicated in changes of electrical potential have been possible by means of delicate radio amplification on the "electroencephalograph." Certain mental affections such as dementia praecox and organic psychoses have been found to produce brain waves characteristic enough for identification. Hence, diagnosis of certain types of psychoses may be simplified and the effects of therapy more objectively recorded. Relations between parts of the brain functioning in so-called intelligence and those related to emotions may be studied through these electrical brain waves and add much

knowledge to the effects of poorly handled emotions.

The extensive activity of psychiatrists interested in educating the public and the medical profession is showing results. Patients are seeking psychiatric help more directly and with less embarrassment. More important is the gradual permeation of psychiatry into general hospitals and in the general medical and surgical services. Indeed, physicians are becoming more aware of the *patient* who has a disease and are calling for psychiatric help or learning psychiatric methods in dealing with the emotional problems related to, assisting in the cause of, or resulting from organic diseases. Therapy of organic diseases is also influenced by extension of psychologic knowledge. For example, the woman with diabetes or the man with hypertension is made worse or better depending on how well their emotional factors as well as their somatic diseases are understood. (R. R. G.)

**Psychical Research.** Important developments in psychical research have taken place in both Europe and America during recent years. This is due primarily to the efforts which orthodox science is now making in the investigation of the abnormal faculties of the mind. Active groups of workers at such universities as Bonn, Duke, Johns Hopkins, Leiden, London, and Utrecht are producing results which augur well for the future.

Dr. J. B. Rhine's work on "extra-sensory perception" (the newest term for telepathy, thought-transference, and clairvoyance) has stimulated those interested in abnormal psychology to repeat his experiments. Dr. Rhine and his colleagues at Duke discovered that certain of the students and others possessed the telepathic or clairvoyant faculty to a marked degree. Sets of cards, each bearing five different geometrical figures, were used, and the percipients were invited to "guess" the designs on the shuffled, unseen cards. Nearly 100,000 tests were made, and the scores recorded exceeded any estimate based on chance. S. G. Soal, of London university, has duplicated Rhine's experiments, but not his results, the good "guesses" not amounting to more than chance would account for. Dr. Hans Bender, of Bonn university, has been more successful. G. N. Tyrrell, R. H. Thouless, and others of the (British) S.P.R. have also concerned themselves with extra-sensory perception, though the whole subject is still too controversial to admit of any positive deductions.

In 1937 the mystery of fire-walking was solved. Two years previously, a young Indian named Kuda Bux demonstrated to the University of London council for psychical investigation that he could walk barefoot on a fire-trench with a surface temperature of 430° C. without injury. These controlled experiments suggested that "faith" was the secret of immunity. In April 1937, a long series of experiments was conducted by the same group with another professional fire-walker, Ahmed Hussain. By instrumental means it was learned that no occult or psychic power is necessary in fire-walking, the secret of which is: (a) the short contact-time of each foot with the embers; (b) the low thermal conductivity of burnt or burning wood embers; (c) confidence in walking. A young Englishman, Reginald Adcock, walked over a fire with a surface temperature of 800° C. and was quite unhurt.

Another event of 1937 was the publishing of the report (the first of its kind) of the University of London council on the "telepathic" faculty of Marion, the vaudeville "thought-reader." It was discovered that his feats were due to unconscious hyperaesthesia of certain of the senses. Finally, spiritual healing is being practised still more extensively in Great Britain, and Milton Abbey, where the Rev. John Maillard conducts his mission, is to be enlarged.

N. C., 1937); Harry Price, *Last Words on the Fire-Walk in the Listener* (London, Aug. 11, 1937); S. G. Soal, *Preliminary Studies of a Vaudeville Telepathist* (Marion report), *Bulletin III*, Univ. of London, Council for Psy. Investigation, 1937. (H. Pr.)

**Psychoanalysis:** see INSANITY.

**Psychology.** Progress in psychology rarely provides the clear-cut stepping stones paralleling the discoveries of radio-activity, heavy water, insulin, in the physical sciences, but shares with these their dependence upon novel or revised principles of interpretation. A selection of recent contributions yields a perspective of problems and positions in contemporary psychology. For its foundations, psychology is dependent upon biology, with closest relations to physiology and psychiatry. Whatever advances the interpretation of mind may be considered as psychology. (See APPLIED PSYCHOLOGY for the practical phases.)

The relation between neural structure and mental function assumes a reconstructed phase in the recognition of a *super-cortex* directing the supreme functions. The primary cortical functions direct interpretation of sense-impressions and coordination of muscle-groups. A more complex hierarchical integration is required for the high-grade animal and above all the anthropoid and human mental constructions. This is provided in the correlational fields, long ago recognized as "silent" areas of the cortex, as not responding to electrical excitations. There are such areas for visual, auditory and somaesthetic functions by support of which intellectual operations proceed. The supreme integration is the function of the great frontal lobes, operating through the correlational fields.

This view summarizes approaches of recent date, and is confirmed by the studies of Penfield. In his technique, the patient (usually for removal of tumor) is conscious during the operation, and as one and another of his cortical areas is stimulated the subject reports what he feels and his movements are noted. Over 100 subjects have been thus stimulated. In terms of actual contractions observable under stimulation, movements of the tongue, facial muscles, neck, jaw (opening and closing), swallowing, vocalization, as well as of trunk and legs, arms and shoulder, and most minutely of the hand and the separate fingers and thumb, have all been localized, together with a map of their spread and distribution. This is the first observation of a vocal sound under electric stimulation on a human subject. The sensory distribution

—reported as feelings—follows a similar pattern, though more diffuse and variable, with the major separation confirmed that the motor area lies anterior and the sensory posterior to the Rolandic fissure. The sequences within this region from above downward (legs at vertex, then arm and hand, then head, lip and jaw) are completely established. A figure drawn in proportion to the importance of their "psychic" representation results in a grotesque homunculus, which presents the actual conscious and control value of these bodily regions. Bard and Woolsey find the same localized somaesthetic area, in the loss through excision, in cat and monkey, of a specific postural or limb placing reaction.

The older view of sharply localized areas for all cortical functions was a half-truth, and the "equipotential" theory that any area was able to take up any function, or that loss of function depends upon quantity of tissue destroyed, has been modified by Lashley, its chief exponent, to the recognition of two orders of cortical relation, the one with a "mosaic" definiteness of location, and the other with far more diffuse localization. There is some substitution of function; but specialization dominates the cortical pattern, and plays an increasing role in the highest types of brains. Stimulating a mass of brain-cells cannot precisely parallel what actually takes place under sensory stimulation. Brickner's case of nearly total loss of *both* frontal lobes (unilateral loss may entail only slight deteriorating effects) shows the focus of impairment to be in intellectual synthesis, inhibition and emotional level. The frontal lobes maintain integrity of superior function. Except for speech, they represent additive, "luxurious" elaborations of processes initiated in other cortical areas. The conclusions confirm the position of Hughlings Jackson of a half-century ago—then dependent upon the interpretation of epileptic seizures, and his rare insight. In consequence of recent contributions, there has been established a far more complete picture of the neural basis of mind.

Cannon, Lashley, Bard and others bring additional evidence of the separability of the psychic emotion and the physiological registration of the expression of the major vital emotions, such as rage and fear. The thalamic region is definitely the seat of emotional expression; but it requires some process of cortical radiation to arouse the full emotion. The relations between the subcortical and cortical emotional "ring" await clarification. The James-Lange approach is proved out of focus.

Prominent in recent discoveries are the brain-waves, proving that the brain is not a passive organ awaiting stimulation, but initiates activity. The patterns of brain-waves differ in waking activity and sleep, and in the "floating off" feeling and in actual sleep by way of changes in frequency and form. The brain-waves, representing electrical potentials, are rhythmical, and their fluctuations suggest changes in the rippling of a pattern. The alpha type has a frequency of about 10 and the beta type of 25 per second. Brain-waves may eventually give a clue to differential drug action, stimulants and narcotics, and to severe psychopathic disturbances. There are individual types. They give no indication of the content but only of activity of the life processes of the cells. They represent the general condition which a total stimulus meets and directs to specific courses through neo-pallial organs.

The recording of brain-waves (oscillogram or electroencephalogram) has been applied to the objective study of primary organic responses and to the study of excitations of vision and hearing. Carmichael has demonstrated the development to responses in guinea-pigs from the 48th to 50th day of gestation, and correlated them with development of the nervous centres, and thus restated the relations of maturation and learning. From the responses of the young of the opossum, Bray draws similar conclusions as to completeness of response in early stages.

BRAIN WAVES in awake state and sleep. Record 1 shows the rippling when awake, with the 10 per second rhythm marked; yet with modulation. Record 2 is of light sleep; the 10 per second waves appear as notches upon the 10 per second waves. Record 3 is of deep sleep, showing marked 1 per second waves. The effects of disturbances during sleep but not sufficient to awaken, are much slighter, less regular, but apparent.

The record of the electric changes when sound reaches the ear, by Weaver and Bray, shows that the tone of low or middle range retains its specific vibrational characteristic in the auditory nerve and primary brain centers; which fact has bearing upon the functioning of the parts of the ear and their development. By combining the methods of conditioning and record of electric potentials, Culler has shown that each audible frequency has its own focus of response within the cochlea, the lowest tones of the registry near the apex of the cochlea; that the acoustic vibrations continue in disparate paths and in conformity to their pattern in the cochlea along the auditory nerve and lower centers. This result provides an additional basis for the analytical power of the human hearing, which makes speech and music possible.

A further interesting auditory study concerns the function of the ear in detecting the direction of sounds. A pseudophone makes sounds from the right which would be so recognized as louder in that ear, actually louder in the left ear. This confusion is even more difficult to adjust to than the pseudoscope of Stratton, which compelled the eyes to see with a direct image. All this bears upon the early fixation of habit in the neural pathways.

Along with the objective study of cortex and brain-waves, the technique of the conditioned reflex has been developed by Hull, who bases upon it an elaborate series of formulations, extending to a system of explanation of the mental mechanisms of adaptive behaviour. His researches form a noteworthy program. The eyelid, pupillar, knee-jerk, plantar reflexes, hand withdrawal, respiration, pulse, feeding reaction of infants, urinary output, etc., as well as the original salivary secretion, all are subject to conditioning. This Hull regards as the exemplar of the learning process at all grades. It is not the omission of "consciousness," for which he finds no place in a scientific formulation, but the neglect of the entire cerebral evolution, in which conditioning plays a minor rôle, that forms the ground of objection to this mechanistic scheme. The cortex may be interpreted as an elaborate device to supersede, to limit, and to escape conditioning.

An impressive advance is that of the field of animal behaviour. The presentation of the methods, principles and results of *Comparative Psychology*, by Warden, in three volumes, sets a model for other divisions of the rapidly expanding experimental sciences. Especially notable is the contribution to the mental and emotional life of the anthropoid apes, proving their foothold on the lower rungs of the ladder of human intelligence. These conclusions derive from the studies of Yerkes, of Mme. Abreu at Havana, and Mme. Kohts in Russia. The field of experimental psychology may be inferred from the contributions here sampled. Its scope appears in the volume of studies commemorating the fiftieth anniversary of the *American Journal of Psychology*.

The experiments of Rhine, claiming to establish the existence of extra-sensory perception—a more precise term than *telepathy*—in a selected series of a few subjects, have aroused great popular interest. The scientific attitude is at present sceptical. There has been no attempt to meet the biological objections to such an agency; manipulative errors are suspected, especially in the absence of control by independent methods. The methods have been criticized by Willoughby, Cox, Kellogg, Rogosin and others. A *Journal of Parapsychology* has been founded at Duke university.

**Public Assistance:** see RELIEF.

**Public Health Engineering.** The basic physical and physiological data which underlie the practical arts of ventilation and air conditioning are being investigated with renewed interest and from some new points of departure. Professor Winslow and his associates at Yale have developed a new technique in the study of "partitioned calorimetry" whereby thermal equilibrium in the body is studied as the algebraic sum of heat production and of heat loss or gain by the avenues of radiation, conduction and convection and evaporation, each separately determined. A novel feature of these studies is the use of polished copper walls, reflecting radiant heat from a hidden source, hence having radiation temperatures independent of their actual temperatures.

Interest in the relation of radiant heat to comfort and health, has been largely stimulated by the British sanitarians. Following a renewed interest in radiant or so-called panel heating they have defined the mean radiant temperature as the uniform temperature of an enclosing sphere that would exert the same total radiation effect upon a human body as do the actual enclosing walls, floor and ceiling of a given space; and the equivalent temperature, as that uniform temperature of air and surrounding walls, that would result in a heat loss from the body by radiation and convection equal to that actually experienced. Mr. Dufton, of the Building Research Station, has developed an instrument, the Eupatheoscope, for integrating radiant and convective heat loss from the body and Dr. Bedford of the Industrial Health Research Board has described the Globe thermometer for distinguishing radiant from air temperatures.

There is likewise a renewed interest in the physiological bearing of radiation as distinguished from the usual warm air heating. Dr. Hardy at Cornell university medical college, New York, has demonstrated that perception of warmth results from radiation stimulus which brings about an elevation of skin temperature of only  $0.03^{\circ}\text{C}$  at a rate of  $0.01^{\circ}\text{C}$  per second.

The demonstration by Professor Wells that bacteria and viruses of the nasal-pharynx may, after evaporation of their carrier droplets of mouth spray, remain suspended in the air for appreciable times and be carried over considerable distances in viable condition, has led to a renewed interest in the possibilities of air-borne infection. Wells has extended his experimental studies of ultra-violet ray disinfection to actual working tests in hospital wards and operating rooms and laid down a standard procedure for evaluating the disinfectant power of a given lamp system in a given room system. On the interpretive side Buchbinder has examined some 7,000 samples of air from school-rooms, theatres, subway cars, etc. with special reference to "total counts" and numbers of alpha haemolytic streptococcus present and capable of growing on blood agar. The latter in particular appear to be always present in the air of occupied places and to provide a criterion of air pollution by human occupancy.

**Water Supply.**—Definite proof of the relation between fluoride in drinking water and "mottled enamel" of children's teeth has led to a systematic search for treatment methods capable of reducing fluoride content to below the dangerous concentration—about 0.8 mg. per l. Several methods have been proposed, the most successful depending upon the application of excess magnesium salt and its subsequent removal by usual softening procedures.

An unusual prevalence of enteric disturbances of obscure etiology and origin has caused concern among epidemiologists and water-works operators alike. Many of these small outbreaks appear to be water-borne and there is serious questioning by water-works men of the adequacy of bacteriological evaluation of water based wholly upon the *B. coli* test.

**Sewage Treatment.**—While in the United States there has been a considerable revival of interest in chemical treatments, the more complete bio-oxidation processes are still in favour in Great Britain and on the Continent. The great works of the West Middlesex Main Drainage Scheme, at Mogden, serve a present population of over one million, in a complete activated sludge plant, the largest in the Empire. In Germany, chemical processes are limited to those industrial wastes where bio-chemical processes are inadequate. Both in Great Britain and in the United States, the ultimate biological mechanism involved in the oxidation of organic wastes is being intensively studied. The consistently uniform rate of oxidation observed in laboratory tests of the biochemical oxygen demand, and apparently representing some rather fundamental biological principle, is not maintained under the conditions of the activated sludge treatment where rates of oxidation may be as much as ten times greater.

**Food Control.**—In the United States pasteurization of milk is practiced almost universally in the larger cities and the practice is extending to the smaller communities. The practice is also being rapidly extended in the principal British cities and on the Continent. While it is known that holding milk at from 142 to 145° for 30 minutes provides adequate protection, it has hitherto been impossible for health authorities to assure themselves that each particle of milk delivered has been thus treated. The recent development of the phosphatase test now permits the authorities to assure themselves on this point. The enzyme phosphatase, universally present in raw milk, is just about completely destroyed in 30 minutes at pasteurizing temperature. The test distinguishes milk underheated by one or two degrees, or held for 25 instead of 30 minutes.

**General.**—British sanitarians are actively interested in the applications of the open-air school. Begun as a preventive and curative measure in tuberculosis, the practice is being advocated for general use. Dr. J. U. R. Simpson has recently summarized its advantages among which he notes increased metabolism of 40 to 50%, resulting in better appetite and nutrition. To this feature, coupled with regular rest, controlled diet and good medical care, he attributes much of the observed advantage. (See also MEDICINE: *Public Health Work*.) (E. B. PH.)

**Public Health Services.** The difference between the organization of governmental public health services in the United States and that in most European countries is a difference inherent in the different forms of government. Governments with highly centralized powers have highly centralized health organizations, with supreme authority in all health matters. The Government of the United States, on the other hand, is a Federal Government, with divided authority and jurisdiction. Local health matters remain therefore in the police power of the states, and the states delegate authority to lesser civil divisions within their jurisdictions. The Federal Government administers health laws and regulations of national import, such as national quarantine laws and regulations, enters into treaties with foreign nations regarding international health matters, acts for the protection of health in inter-State traffic and the suppression of epidemics. It also engages in advisory, consultative, and investigative activities and aids state and local health organizations in health matters. As insanitary conditions, epidemics, and ill health are no longer considered of purely local

concern, the future may see an expanded conception and a broader interpretation of Federal health powers.

The official governmental health services consist, therefore, of the United States Public Health Service, created by Act of Congress in 1798, of state departments of health, and of the health organizations in towns, incorporated villages, counties, and rural districts. Local health ordinances and regulations must not be inconsistent with state and Federal laws. The state departments of health have jurisdiction over sanitation, control of communicable diseases, collection of vital statistics, maintenance of diagnostic laboratories, furnishing serums and other biologics, and similar health matters. The centralization and leadership in state health organizations vary; since 1920 there has been a tendency to build up stronger city and county health organizations. In addition to these official health organizations, there are many unofficial and private health organizations, professional associations, and various funds or foundations, which have made their contribution to the improvement of public health. Also many other Federal agencies, such as the Children's Bureau, the Bureau of Mines, the Office of Education, the Bureau of Chemistry and Soils, and the Food and Drug Administration, deal with some aspect of public health.

The history of public health service in the United States divides itself into four eras. The first was the era of sanitation, in which public health work was largely restricted to the control of environment and the enforcement of quarantine. Through improved sanitation of water and milk supplies and sanitary disposal of human wastes, great reduction in communicable diseases was accomplished. The second period marked the development of public health education—the dissemination of popular information regarding the prevention of disease. The third era, which began in 1912 with the common action of the American Medical Association and official and non-official health agencies was the development of the public health concept that all potential benefits of preventive medicine should be made available to every individual, and the periodic health examination was considered the *sine qua non* of such a complete health service. The value of the periodic health examination was apparently overestimated, but the broader interpretation of applied preventive medicine was carried over into the succeeding era.

We are now entering the fourth era of public health, which still has the objective of medical service and medical guidance for every individual from before birth to old age, but which is marked by a shift in the diseases and conditions attacked. Following the rapid decline in acute infectious diseases, there has been an increase in the chronic diseases of adult life. The control of the common communicable diseases, many of which have been reduced almost to a residual minimum, goes forward on its own momentum, and the emphasis of public health work is being shifted to such conditions as rheumatic heart disease, cancer, and other crippling chronic diseases which have become a challenge to the science of preventive medicine.

In recent years the U.S. Public Health Service has emphasized the need for better trained public health personnel, more ade-

Death rates per 100,000 estimated population in the Registration Area for tuberculosis (all forms), typhoid fever, diphtheria, cancer, and heart disease in five-year periods from 1890 to 1935.

Disease	1890	1900	1905	1910	1915	1920	1925	1930	1935
Tuberculosis (all forms)	245.4	201.9	192.3	160.3	146.3	114.0	86.7	71.5	55.0
Typhoid (and paratyphoid) fever	46.3	35.0	27.8	23.5	17.4	7.8	8.0	4.8	2.8
Diphtheria	70.1	43.3	43.6	21.4	15.7	15.3	7.8	4.9	3.1
Cancer (and other malignant tumours)	47.9	63.0	71.4	76.2	81.4	83.2	92.8	97.3	107.9
Diseases of the heart	121.8	132.1	152.2	158.8	165.7	159.1	185.7	205.7	213.1

quately staffed health services, and the extension of full-time health services to rural areas. These objectives are being brought near to achievement through the impetus given public health work by the health provisions of the Social Security Act. In 1937 there were 946 counties in the United States with full-time health services, an increase of 50 per cent as compared with the number in 1935. State and local appropriations for this work were \$7,500,000 higher in 1937, the increase almost equalling the amount, \$8,000,000 allotted to the States under the Social Security Act. Of this allotment, \$1,184,000 was set aside for the training of personnel and 34 States allotted nearly \$330,000 for the maintenance of adequate laboratory facilities. In the fiscal year 1937, 1,595 public health workers (1,173 nurses) completed courses of training in public health. (See also *MEDICINE: Public Health Work*; *STATE LEGISLATION: Health*.) (T. P.)

**Public Libraries:** see *LIBRARIES*.

**Public Utilities.** In historical perspective public utilities have, in recent years, continued to progress from a technical, economic, and regulatory point of view. Increasingly the economic and corporate organization of these industries in the United States during the past decade has assumed interstate proportions. The State regulatory commissions were thus without sufficient powers to deal with the widespread and interwoven corporate structures of the electric, natural gas, and communication industries.

**Extension of Federal Regulation.**—Wisconsin, New York, and other States made extensive commission reorganizations in 1937 in an effort to meet the changes which had occurred in these regulated industries. The adequacy of this reoriented State regulation to protect consumer interests without aid from Federal agencies is debatable. The depression beginning in 1929 focused public interest upon the expanded character of the utility industries and especially upon the abuses associated with holding companies and their security issues. There was also a revival of the movement for conservation of natural resources.

Radio broadcasting companies, formerly under the Federal Radio Commission, and interstate telephone and telegraph companies, formerly under the Interstate Commerce Commission, were placed under the Federal Communications Commission, 1934; regulation of interstate motor carriers under the Interstate Commerce Commission, 1935.

**The Securities and Exchange Commission (S.E.C.)** administers three statutes: the Securities Act of 1933, first administered by the Federal Trade Commission; the Securities Exchange Act of 1934, which created the commission; and title I of the Public Utility Act of 1935. The first statute required registration of new security issues with full and fair disclosure of material facts. The act of 1935 declared that "public utility holding companies and their subsidiary companies are affected with a national public interest" and provided for measures designed to give full and fair disclosure of the corporate structure of holding company systems controlling gas or electric operating companies. The act provided for the elimination of uneconomic holding company structures and for extensive regulation of corporate activities.

The Securities and Exchange Commission has been attacked in a large number of court cases involving the registration of utility holding companies. In a test case advanced by the Government to compel registration of the Electric Bond & Share Company the commission won decisions in the lower courts. On Jan. 3, 1938, the Supreme Court accepted the case for review. At that time it was estimated that about one-half of the companies affected, with control of something more than one-third of the electric and gas properties of the country, had registered voluntarily.

**The Federal Power Commission (F.P.C.)** was established by the Federal Water Power Act of 1920. Amendments to this act in 1930 reorganized the commission. Title II of the Public Utility Act of 1935 vested in the commission regulation of the rates and charges of electric utilities in interstate commerce, supervision over their mergers, sales or transfers of property, over security issues, and over other matters. Its powers to fix reasonable rates for electric energy transmitted in interstate commerce are supplemented with authority to co-operate with the State commissions. Accordingly, the commission has prepared, in co-operation with State commissions, a uniform system of accounts, applicable to all companies subject to its jurisdiction, which became effective Jan. 1, 1937. By the end of the year comparable systems, applicable to the companies subject to the jurisdiction of the State commissions, had been prescribed by commissions in almost one-half of the States.

These developments in uniform accounting, together with disclosures made in the S.E.C. security and holding company registrations, and the beginnings made in simplification of holding company structures, are all of fundamental importance to sound regulation. The 1937 annual report comments that "all those concerned take pride in the progress made in the field of regulatory accounting and feel that the co-operation between Federal and State commissions which brought about these achievements is unparalleled in the history of regulation in this country."

**Rural Electrification Administration (R.E.A.)** was created by executive order in May 1935, under the Emergency Relief Appropriation Act of 1935. It was given permanent status by the Rural Electrification Act of 1936. Its purpose is to facilitate, through organization or initiation, financing and supervision of new projects, the introduction of electric service into unserved rural areas for the material improvement of rural life. The administration has extended to a nation-wide basis the non-profit co-operative organization, long-term, low-interest financing, and economically-built rural line practices initiated by the Tennessee Valley Authority in 1933 and 1934. Projects sponsored by private utility companies are equally eligible to benefits under the act, but the plan of carrying service to the less densely settled areas has resulted in the greater part of the aid being given to non-profit co-operative associations of consumers. (See also *RURAL ELECTRIFICATION*.)

The administration's 1937 annual report gives the following data:

	Construction Released (Completed)	Loan Contracts Executed	Allotments Approved
Line construction:			
Amount of loans . .	\$51,594,312	\$70,847,470	\$76,260,923
Miles of line . . . .	53,069	67,043	73,584
Number of customers .	174,407	235,032	251,988
Generating equipment:			
Amount of loans . .	\$ 1,162,521	\$ 1,280,000	\$ 2,760,000
Wiring and plumbing:			
Amount of loans . .	\$ 300,000	\$ 440,550	\$ 782,500

The activities of the R.E.A. have spurred private electric utilities to revise their rural electrification policies and to carry service to large numbers of rural customers who had been left unserved.

**The Federal Emergency Administration of Public Works (PWA)** was created under title II of the National Industrial Recovery Act in 1933. Its purpose is to encourage recovery and provide for the construction of useful public works. Among the local projects of a utility nature supported by loans and grants have been sewerage and water systems, and electric generating

and distribution plants. The loans and grants to public agencies or competitive electric plants were challenged in the courts by the private companies. These cases finally culminated in a decision of the U.S. Supreme Court in the case of *Alabama Power Company v. Ickes, et al.*, decided Jan. 3, 1938, the effect of which was to release loans and grants for 61 publicly-owned projects in 23 States, having an estimated total construction cost of \$146,917,008 for which PWA had allotted \$61,225,544 in loans and \$38,412,008 in grants. The essence of the Supreme Court's opinion was that creation of competition between publicly and privately-owned utility systems, even though it prove ruinous to the private utility, is no bar to Federal aid.

**Federal Multiple-Purpose Projects.**—A number of Federal projects have been undertaken in the interests of conservation of natural resources, which mark an expansion of past conservation practices. The outstanding changes reside in the greater amounts of hydro-electric power involved and in the policies adopted for the disposition of this power. In general, the policy has been to liquidate all or a part of the total cost of the project through sale of power. These projects involve river improvement, navigation, flood control, salinity control, irrigation, and power production. The initial installed capacities of the major hydro-electric projects will be as follows: Bonneville, 86,400kw.; Boulder, 370,000kw.; Casper-Alcova, 32,400kw.; Central Valley, 60,000kw.; Fort Peck (navigation only); Grand Coulee, 525,000kw.; Tennessee Valley Authority, 697,000kw.

**For the Tennessee Valley Authority (TVA)**, one of the largest projects of this nature, see TENNESSEE VALLEY AUTHORITY, and for the Bonneville project, see TUNNELS. (M. G. G.)

**Great Britain.**—The public services owned or supervised by the State or local authorities are concerned mainly with the provision and distribution of various forms of power, such as electric light and power, and gas, with communication and transport, and water supplies. In addition must be mentioned the Post Office, the British Broadcasting Corporation, the many amenities such as libraries, baths, markets, parks, street-lighting, etc., and the health services of various kinds maintained by the State and municipal authorities and that are more properly grouped under social services. The tendency for such services to be concentrated increasingly in the hands of regional bodies is a marked feature of recent years, exemplified in 1937 by the recommendations of the Royal Commission on Tyneside (see MUNICIPAL GOVERNMENT: *Great Britain*), the proposals for the formation of public transport boards in Brighton, on Merseyside, and elsewhere, and the plans of the Government, to form the subject of a parliamentary bill in 1938, for the amalgamation of electricity-distributing bodies into larger units.

A good example of the lines on which new public service authorities are being constituted is the London Passenger Transport Board, formed in 1934, to co-ordinate passenger transport undertakings in the metropolitan area (extending for a distance of some 30mi. from Charing Cross), and consisting of seven members appointed for varying periods by a body of *ex-officio* trustees, the capital of the board being mainly issued as stock to the various authorities and organizations by the amalgamation of whose interests the board was constituted, a minimum rate of interest being guaranteed to stockholders.

"Air raid precautions" was a new public service that was coming to the front at the close of 1937, as also was the provision of airport accommodation by local authorities, over 60 such airports being already in use or in course of construction. (See also ELECTRICAL INDUSTRIES; ELECTRIC TRANSMISSION AND DISTRIBUTION: *Distribution*; GAS; UNITED STATES: *Recession, 1937*.)

**Publishers' Prizes:** see LITERARY PRIZES.

**Publishing.** Book publishing reached its lowest ebb in 1933. Recovery, which by 1936 approximated the level of 1929, continued through the year 1937.

Statistics from various countries of the world are not precisely comparable. German figures include a large amount of pamphlets and other material such as copyrighted theses, etc. Russian figures also include a large amount of pamphlets for educational and propaganda purposes. Consequently, Russian and German figures are about three to five times the size of those of the United States. The statistics of Great Britain and France include pamphlets, but the selection reported reflects the method of inclusion adopted in the United States. Only pamphlets comparable in size and content with books are included in the U.S. figures. If all kinds published were reported, as in German and Russian statistics, the total pamphlets would far exceed the total number of books.

The increase for the year 1937 in the United States was 4% over 1936, against a 25% increase for 1935-36. Thirty-four per cent of the listed titles were published by 18 houses which issued more than 100 titles each. Macmillan, with 605 titles, reached a new high.

As compiled by *The Publishers' Weekly*, American book production for 1936 and 1937 follows:

International Classification	For 1936			For 1937			
	New Books	New Editions	Total	New Books	New Editions	Total	Net Change
Philosophy . . . . .	107	13	120	128	24	152	+ 32
Religion . . . . .	684	26	710	767	44	811	+101
Sociology, Economics . . . . .	489	46	535	693	60	753	+218
Law . . . . .	108	41	149	128	21	149	—

Total of New Books and New Editions . . . . .			10,436			10,912	

The outstanding development in the field for the year was the extension of fair trade laws. By Jan. 1, 1938, 48 publishers had price maintenance agreements in force in 35 States, and there were fair trade laws in 42 States. The fair trade laws and the price maintenance agreements between publishers and retail booksellers resulted in the elimination of much price-cutting and unfair competition.

The National Association of Book Publishers, organized in 1919, concluded its extensive activities in December, 1937. At that time, publishers organized the Book Publishers Bureau, a service organization which will continue some of the work of the N.A.B.P.

**Book Fairs.**—This promotional idea, launched a few years ago, was especially successful in 1937. The *New York Times* National Book Fair ran for two weeks at Radio City, New York, in November, bringing lectures by prominent authors and publishers and exhibitions to thousands of visitors. Boston held its first Book Fair in 1937, and there were other fairs throughout the country—Detroit, Mich., Chicago, Ill., Dallas, Texas, Nashville, Tenn., Brattleboro, Vt., Battle Creek, Mich., to name a few. (See also CANADIAN LITERATURE; CHILDREN'S BOOKS.)

**Best Sellers.**—The outstanding novel was *Gone With the Wind*, with a sale of more than 399,999 copies to add to its record total, in 1936, of one million. The highest sale for the year was that of *How To Win Friends and Influence People*, with 729,000 copies. As compiled by *The Publishers' Weekly*, the 1937 best sellers are, in the order of their success:

In fiction: *Gone With the Wind*, by Margaret Mitchell; *North-west Passage*, Kenneth Roberts; *The Citadel*, A. J. Cronin; *And So—Victoria*, Vaughan Wilkins; *Drums along the Mohawk*, Walter D. Edmonds; *The Years*, Virginia Woolf; *Theatre*, W. Somerset Maugham; *Of Mice and Men*, John Steinbeck; *The Rains Came*, Louis Bromfield; *We Are Not Alone*, James Hilton.

In non-fiction: *How to Win Friends and Influence People*, Dale Carnegie; *An American Doctor's Odyssey*, Victor Heiser; *The Return to Religion*, Henry C. Link; *The Arts*, Hendrik W. Van Loon; *Orchids on Your Budget*, Marjorie Hillis; *Present Indica-tive*, Noel Coward; *Mathematics for the Million*, Lancelot Hog-ben; *Life with Mother*, Clarence Day; *The Nile*, Emil Ludwig; *The Flowering of New England*, Van Wyck Brooks.

**Great Britain and Ireland.**—In 1937, Great Britain enjoyed its highest annual total in book publishing. As indicated above, the figures are not strictly comparable with those of the United States because of the inclusion of pamphlets. Excluding pam- phlets, the English total of new editions is 10,790 as against 10,912 in the United States.

According to the records of *The Publishers' Circular* and *The Publisher and Bookseller*, the following is an analysis of books published in Great Britain and Ireland in 1937:

Classes of Literature (International Classification)	New Books			New Editions	Totals for 1937	Totals for 1936
	New Books	Trans- lations	Pam- phlets			
Philosophy . . . . .	217	18	12	26	273	274
Religion . . . . .	745	68	78	126	1,017	948
Sociology . . . . .	693	24	290	84	1,091	1,177
Law . . . . .	140	3	40	82	265	260
Education . . . . .	242	1	46	35	324	293
Military and Naval . . . . .	123	..	62	41	226	235
Philology . . . . .	211	3	16	28	258	235

**Germany, France and Russia.**—Publishing information for these countries in advance of actual figures would indicate a con- tinued rise in volume. The chart in the second column shows the latest available figures, but it is to be remembered that the in- clusion of pamphlets of all kinds in German and Russian statistics is the reason for the apparently disproportionate and smaller pub- lishing activity in the English-speaking countries.

In Germany, the number of titles (including pamphlets) rose from 20,852 in 1934 to 23,654 in 1936, and probably reached 25,000 in 1937. New titles increased only 0.1% from 1935 to 1936, while the new edition of old books—about one-fifth of the entire book production—increased some 10%. (W. Yu.)

**Purchasing Power of Money.** The term *purchasing power of money* means the amount of goods which money will buy. Obviously, at any given moment, money has a specific purchasing power for each kind of goods on the market. From day to day, each of these specific purchasing powers is likely to change, for the prices of goods commonly fluctuate.

In a broad way, the purchasing power of money tends to vary directly with its relative scarcity as compared to the supply of goods. Thus, when money is scarce and goods abundant a unit of money will buy a relatively large amount of goods. Statistical analysis proves, however, that the purchasing power of money is correlated more closely with the physical volume of trade than with the supply of goods on hand. Thus, when the ratio of the number of units of money to the number of units of goods dealt in grows larger, the purchasing power of a unit of money falls. The reverse is also true.

Attempts are often made to measure changes in the general purchasing power of money. To do this accurately, it would be imperative to have on hand a record of all exchanges of money for goods occurring during the period under consideration. Obviously, no such record is obtainable. It is, however, feasible to estimate without a very large error the average changes occurring in the command of money over certain large groups of commodities. Statisticians have compiled index numbers of prices believed to be representative for such groups as the following: (1) Commodities of all types sold at wholesale; (2) Commodities dealt in largely in international trade; (3) Articles consumed by the labouring classes; (4) Articles consumed by farmers; and (5) Corporate stocks sold on the exchanges.

The Federal Reserve Bank of New York compiles an index series weighting the price changes for various groups of commodities in proportion to the importance which each is believed to represent in the total trade of the United States. This index presumably comes the nearest of any published series to recording changes in the general purchasing power of money. Experience indicates that it fluctuates in much the same manner as indexes representing the prices of articles sold at retail to the labouring classes.

<sup>n</sup> The relatives here presented are the reciprocals of the relatives recorded in the left-hand section of this table.

Reciprocals of the index numbers just mentioned furnish reasonably good criteria of the purchasing power of money as regards each of the respective groups of commodities covered.

During the last half century, the purchasing power of money has fluctuated widely in most nations. In both the United States and England, the command of money over goods increased from the 1870's until about 1897. Discoveries of gold in the Klondike and South Africa then made money more abundant in gold standard countries. Since both the United States and the United Kingdom were comprised in this group, the purchasing power of money fell in both nations. This decline continued slowly until the beginning of the World War. Soon most European nations abandoned the gold standard and began issuing great quantities of paper money. As a result, the purchasing power of the paper money declined sharply. According to Gresham's law, which states that cheaper money drives out dearer money, European paper money drove gold to the United States which was still on gold standard. This advent of great quantities of new gold caused the purchasing power of money to decline greatly in the United States. When, in 1917, the United States entered the war, inflation by the Federal Reserve Banks caused the purchasing power of money to fall still more rapidly. The decline culminated in the spring of 1920. Immediately thereafter, the speculative demand for commodities collapsed and the purchasing power of money increased sharply for something like a year, but thereafter declined somewhat. During the period 1922 to 1929 the purchas-

ing power of money in terms of commodities at wholesale remained fairly constant, but it fell in terms of land and corporate stocks. At the close of 1929, the stock market boom collapsed and the purchasing power of money increased sharply until 1932. Money's command over goods then began a decline. In both England and the United States this decline was greatly accentuated by abandonment of the gold standard and credit money inflation. In England, the decline was still continuing slowly throughout 1937. In the United States, because of a cessation of the inflation process, the command of money over commodities at wholesale, which had been declining rather rapidly since the middle of 1936, began increasing in August, 1937, and this movement continued until the end of the year. In both England and the United States, the latter part of 1937 was marked by a great increase in the purchasing power of money as measured in terms of stocks of corporations.

The relative extents of the major movements in this command over commodities at wholesale and retail are shown for the United Kingdom and the United States in the accompanying table on this page in which all data are compared to the base, January 1937, at which date the purchasing power is considered 100. (See also GOLD.)

(W. I. K.)

**Purdue University**, at Lafayette, Ind., is Indiana's Land Grant institution, created under the Morrill Act of Congress of 1862, granting to each State public

lands for the establishment of a university for the teaching of "agriculture, science and the mechanic arts." The Indiana general assembly on May 6, 1869, accepted a gift of 150 acres of land and \$200,000 in cash from John Purdue and other citizens of Tippecanoe county for establishment of the institution. The university received its first students in March 1874, and the first regular academic year began Sept. 16 of that year with a faculty of six and student body of 64. Enrolment as of Oct. 1, 1937, was 6,176, divided as follows: all engineering, 3,433; agriculture, 760; pharmacy, 161; science, 728; home economics, 666; physical education, 119; graduate students, 309. This is a gain of more than 12% over the previous year. For some years Purdue has had the largest engineering enrolment of any institution of higher learning in America. The faculty and staff now numbers over 650.

Within the past 12 months the new executive building and a second unit of the women's residence hall have been occupied; and contracts were awarded for two more sections of the men's residence halls, for an agricultural chemistry building, and for an addition to the horticultural building. Buildings now number 69 on campus and adjoining farms.

Experimental runways to test different kinds of surfaces were almost completed at the university-owned airport of 208 acres; a new project to test wearing qualities of different surfaces in ordinary highway traffic was started, and development of devices to help ward off static electricity from aeroplanes was begun. Testing of railway car wheels also was another new project inaugurated within the year, along with new studies in the field of nuclear physics; studying growth of plants without soil, using only gravel and a nutrient solution; testing of various kinds of lights to attract insect pests in orchards and corn fields. Another new project undertaken was one to test the wearing qualities of the various coverings given wire fences, both for farm and ornamental purposes. These projects were in addition to the several hundred other agricultural, engineering and pure scientific research projects which have been in progress or completed in years past.

New courses offered during the year included several in education and the creation of the Department of Education and Applied Psychology as a separate department within the institution and creation of the School of Metallurgical Engineering in connection with the School of Chemical Engineering.

**P.W.A.:** see PUBLIC UTILITIES.

## Pyrite or Pyrites.

World production of pyrite in 1935 reached 8,340,000 metric tons, only slightly less than the 1929 high, after having dropped to a low of 5,700,000 metric tons in 1932. Spain is the leading producer, having furnished 51% of the output in 1929, 37% in 1932, and 27% in 1935. In 1936 operation of the largest Spanish mines was seriously interrupted by the civil war when the region was occupied by the rebel forces. Among other producers, Japan has a rapidly increasing output that ranked second in 1934 and 1935, and has probably stood in first place since then, though this can not be confirmed until more information is at hand on conditions in Spain. In the next rank of producers, with outputs of 500,000–1,000,000 tons, are Italy, Norway, the Soviet Union and the United States; in the 100,000–500,000 ton group are Cyprus, Germany, Portugal, France, Greece, Canada, and Sweden, and a number of others have still smaller outputs.

The United States output of 556,000 metric tons in 1936, which was almost treble the 1932 low and 58% greater than the pre-depression high, although a record figure, was still insufficient to meet the demand, and was supplemented by imports of 436,500 tons; in the past, imports have been almost entirely from Spain,

but 1936 showed a marked drop in Spanish imports, which will probably be increased in 1937, as other countries are called on to supply the deficit in the normal Spanish output caused by the war.

A recent important technical development in the burning of pyrite is the so-called flash roasting process, in which the finely divided material is burned while suspended in a blast of air.

(G. A. Ro.)

**Quebec,** one of the original Provinces of the Dominion of Canada; area, 594,534 sq.mi.; population, according to the Dominion census of 1931, 2,874,255, estimated Jan. 1, 1938, 3,096,000. Capital, Quebec, 130,954. The only city with larger population is Montreal, 818,577. Of the Province's population 1,813,606 are urban, or 63%; 2,696,122 native born; only 178,133 foreign born.

Two types of trade unions are found in Quebec; the National Catholic Unions and the older International Unions. The former have a membership of about 50,000, while the membership of the latter is smaller. In 1937 the Workmen's Wages Act was passed by the provincial legislature. In brief, this act provides that any trade agreement between employers and employees may be made binding on all employers and employees in the same kind of industry within the district included in the original agreement. This can be done only by the Government after application of the employer or employees or the representative of either. The Fair Wage Act which became operative on and after Sept. 1, 1937 provides for the establishment of a Government Board, which on its own initiative or after hearing the report of a committee representative of employer and employees in equal numbers, may fix wages for minors under the age of 18 and may determine in general the working conditions of all employees in an industry. No wage lower than the minimum fixed for such minors shall be paid any employee. No employer may interfere with any of his employees who may desire to organize for collective bargaining, nor may any employer dismiss or discriminate against his employees on the ground that they are members of a trade union. Action against an employer under this last section requires the consent of the attorney-general of the Province. The net value of production in the province for 1934 was \$593,066,127 (£118,600,000) an increase of 17% over the preceding year. The gross value of agricultural products in 1935 was \$174,758,000 (£34,951,000); of manufactures \$821,020,796 (£164,204,000), an increase of over 100% over the preceding year.

On Aug. 15, 1936, the Liberal Administration of the Hon. A. Godbout was defeated by the Union Nationale and the Hon. Maurice Duplessis became premier and attorney-general of the province. The Hon. E. L. Patenaude is the Lieutenant-Governor. Quebec is represented in the Dominion Parliament by 24 Senators who are appointed for life and by 65 members of the House of Commons who are elected for five years or less.

**BIBLIOGRAPHY:** *Statistical Year Book; Annual Report of the Provincial Secretary and Treasurer.* (J. C. He.)

## Queensland.

A State of the Australian Commonwealth lying in the north-east and occupying 670,500 square miles. The State governor, representing H.M. King George VI is Sir Leslie Orme Wilson, G.C.S.I., G.C.M.G., G.C.I.E. Population (March 31, 1937), 984,824, forming 14.4% of the population of Australia. Capital, Brisbane; population (Dec. 31, 1936), 313,430. The premier of a Labour Government is Mr. W. Forga Smith.

**History.**—Parliament was opened by the lieutenant-governor on Aug. 10, 1937. Legislation in 1937 included Acts regulating air navigation, fauna protection, and State electricity concerns, and

amending the laws relating to public health, lands, and industrial conciliation and arbitration. Excessively dry weather was experienced in the southern agricultural districts during 1937. Public works in progress included the Story bridge over the Brisbane river at Kangaroo Point, and the Stanley river dam. Up to June 30, 1937, the Main Roads Commission had completed 3,879mi. of roads and 13mi. of bridges. Many important road links were completed during the year, both in settled districts and in areas in process of settlement. The report of the Royal Commission on the regulation and supply of electricity in the State was presented to parliament, and the Royal Commission on transport and harbour board problems also reported to the Government. The result of the International Sugar Conference was regarded as satisfactory to Queensland, whose production of bagged sugar in the 1936 season was 719,600 tons.

**Trade, Industry, and Finance.**—Production in 1935–36 was valued (gross) as follows: agricultural, £11,502,000; pastoral, £12,061,000; dairying and other farming, £7,443,000; mining, £2,430,000; forestry, fishing, trapping, £2,419,000; total, primary industry (gross), £35,855,000, (net); manufacturing industry (net value), £15,683,000. Numbers of livestock, Jan. 1937: 5,800,000 cattle, 20,125,000 sheep, 435,000 horses, 305,000 pigs (Jan. 1936). Unemployment fell to an average of 11,910, or 6.4% of those available for employment, in the first nine months of 1937, compared with 14,100 or 7.7% in 1936. Including relief workers, the percentage of unemployment in 1936 was 11.6. In order to encourage unemployed youths in towns to accept farm work, a scheme was introduced in 1937 for payment of wage subsidies according to age and experience. The budget for 1936–37 closed with a deficit of £280,190, the deficit having been originally estimated at £650,664. For 1937–38, estimated expenditure was raised from £16,815,228 to £17,377,313, and estimated receipts from £16,535,038 to £17,046,535, giving an estimated deficit of £330,778. The increase in expenditure was due mainly to the higher basic wage (costing £360,000), the increase in public debt interest and sinking fund (£139,000), and the discontinuance of the Commonwealth special grant (£72,000). Public works expenditure was estimated at £3,369,000 in 1937–38, including £2,219,000 for development and £1,150,000 for railways, buildings, and housing, against actual expenditure of £3,760,000 in 1936–37, including £2,527,470 for development and £1,232,830 for railways, etc. (H. V. H.)

**Racketeering,** organized and systematic extortion of money by means of violence or fear, from legitimate business men and workers, as well as from illegitimate enterprises. The term is loosely misused to describe everything which is cheap or sharp, from simple frauds to business swindles. Such misuse leads to confusion of thought and tends to obscure the dangerous and socially demoralizing aspects of genuine racketeering.

The origin of the term "racket" is obscure. According to the most credible theory the word is derived from testimonial dinners and dances—sometimes political in nature. At the turn of the century political balls came to be known as "rackets." By suggestion of political favour in return for purchase of tickets or reprisal on failure to buy, dominant local political machines used the "racket" to raise funds. This led to imitation, in the extortionate sale of tickets by other organizations and later by hoodlums who sold tickets to functions that never took place. By a process of development the term "racket" came to be used to describe any form of systematic extortion.

Racketeering has become increasingly subtle in recent years and bears little relation to the depredations of the street gangs of previous generations.

Starting from the single extortion known as a "shake-down," it developed to the point where money was demanded upon threat of a spurious picket line, boycott, stenchbombs or violence. It progressed to the superficially legal form of using a trade association as a cloak for extortion. At present it occurs either as industrial racketeering or the commercialization of illegitimate enterprises.

The industrial racketeer has become the middle man in illegitimate relationships between groups of employers and labour unions. The extortion of money takes the form of direct "shake-downs" as well as "dues" and "salaries to officials." The more complex the form, the more difficult it is to detect the existence of racketeering. Almost every act of the industrial racketeer, except the specific threat or actual violence, is carried on under pretense of serving a legitimate economic function and under colour of legality.

In commercialized prostitution and narcotic selling, as well as such forms of gambling as bookmaking, policy, lottery and dice games, racketeering consists basically of predatory organizing by strong and vicious criminals. Small groups or units are welded into large, city-wide or even nationwide units paying tribute to the dominant gangsters. Threats and violence here play a larger part than in industrial racketeering but once subjugated, the victim derives valuable consideration from the racket in the form of protection from other gangsters. In addition, political protection is often accorded, together with the amassing of funds available for bribery and corruption.

The heads of rackets usually have little contact with underlings but direct them from well-appointed offices and luxurious residences. Under the chiefs are lieutenants, lawyers and accountants. Several rungs lower in the system are the men who make the threats and commit violence.

Leading racketeers often have well established political connections of such importance that apparent or real protection from criminal prosecution can be provided to underlings who are arrested. In exchange, the dominant local political party is provided with thugs for use on election day, or proceeds of the racket are shared with more important political leaders. Association between political leaders, business men and important racketeers is rendered less subject to open scandal because the racketeers usually maintain a cloak of semi-respectability as gamblers or even as business men. Furthermore, the most important racketeers have usually successfully avoided acquiring a substantial criminal record. Thus Capone at the height of his power was without any record of a criminal conviction until 1929. Luciano had been convicted of only two petty offences.

Luciano lived in the best hotels, posing as a gambler and associating with some people of fair reputation. Buchalter and Shapiro, alias Lepke and Gurrah, two of America's leading industrial racketeers, had no convictions for many years and were partners in several legitimate clothing firms. Waxey Gordon was a substantial owner in two large hotels and had an elegant apartment in a good residential section, his children attending expensive private schools.

With rare exceptions, leading racketeers successfully avoid publicity and remain comparatively unknown to the public. Once their power and importance are sufficiently established publicly, their usefulness becomes impaired and they are either prosecuted by the authorities or murdered by rivals.

While criminal parasites have preyed on society by systematic extortionate practices throughout the ages, modern racketeering has developed during the last 30 years. Opinions differ as to

the extent to which racketeering was promoted by bootlegging during the prohibition era in the United States from 1919 to 1933. This much is certain—that, by trafficking in a prohibited commodity, this type of crime, with its attendant corruption and violence, became a huge business on a national scale. Bootleggers developed their own enforcement methods, which were readily transferred to legitimate industries after the repeal of prohibition had made bootlegging less profitable. Furthermore, the necessary banking, business and political connections which were developed by bootlegging remained available and were even stimulated following repeal.

One of the serious aspects of modern organized crime is the demoralization of ethical standards of the community. In most industrial rackets at least one or two of the leading business men of the industry have encouraged or even sponsored the entry of criminals into the field. The tempting objective is usually illegal price-fixing, driving marginal producers from business, promotion of monopoly, or protection by gangsters from the activities of legitimate labour unions. Usually several such objectives are involved in a single enterprise. Skilled industrial racketeers on their own initiative have, on occasion, invaded and forcibly seized control of originally legitimate trade unions. Through officers acting under their direction, the racketeers have used the unions to drive business men into trade associations created and operated by agents of the racketeers.

Victims of modern racketeering are seldom willing to testify. So alarming are the threats of destruction of property and even of murder that business men and others frequently submit rather than complain to the law enforcement authorities. On the other hand, many willing victims submit because of financial benefits or business advantage to themselves and because of their own partial responsibility for the racket which truthful testimony would reveal.

(T. E. D.)

## Radio, Scientific Developments of.

Since it is hardly possible in a limited space to review developments in each of the many branches of radio communication, it will be necessary to consider only the more outstanding tendencies which have affected general progress during the past few years and during 1937 particularly. A large proportion of radio research during recent years has been directly or indirectly concerned with the difficulty of finding suitable wave lengths on which the rapidly increasing number of transmitters can work effectively. This difficulty affects all types of radio communication, and has inspired a great deal of work directed towards obtaining additional knowledge on the following problems:

(1) The general question of the propagation of waves and particularly the possibility of using wave lengths considerably shorter than those commonly used in the past, which have hitherto been considered unsuitable for practical application. (2) The reduction of the ether space occupied by each transmitter. (3) The operation of more than one transmitter on the same ether channel.

During the past 10 to 15 years a vast amount of scientific data has been collected concerning the behaviour of the ionosphere in relation to the propagation of what are called the "short" waves. This has more particularly applied to waves used for world-wide communication, that is, those between 12 and 80 metres. Such investigation can be divided into two parts, the first being of a more practical nature and consisting of careful measurements and observations which now make it possible to predict the possibilities of reception of a transmission on any wave length. The collection of such data has of necessity been spread over a considerable number of years, and had to take into

account the direction of transmission, the varying conditions arising from time of day, season of the year, and the condition of solar activity, the latter changing in regular periods of approximately 11 years. It may be said that this side of the work is approaching completion, but work still continues on the second part, concerned with the explanation of practical observations. This has consisted mainly of measurements of the height and characteristics of the reflecting layers of ionized gas, which have come to be called the "ionosphere." This has led to the conception of this gaseous region being divided into loosely defined layers at various heights, each layer possessing different characteristics and affecting wireless waves in accordance with their length. Considerable progress has been made during the past five years in this work, but conflicting theories still exist. A better knowledge of the ionosphere and its effect on propagation phenomena has made it possible to develop direction-finding apparatus giving greater accuracy and reliability at long distances, particularly during darkness. This is a matter of great importance to the conduct of long-distance air transport services.

It is only within the past two or three years that serious and widespread attempts have been made to study the behaviour of wave lengths of less than 10 metres on a scientific basis. It was partly the necessity of finding more ether space for additional transmitters that has so greatly stimulated this work. In addition, the recent introduction of what is known as high definition television, which at present requires an overall band width of some 5 megacycles per second for wireless transmission, has made it essential to consider the only wave lengths on which such a transmission is practicable. At the end of 1937 there was general agreement that it is not possible to use wave lengths appreciably exceeding 7 metres for this purpose. Until quite recently it was thought that the direct ray from a transmitter using such a wave length would not be receivable beyond the horizon. It has been found, however, that the horizon does not form a natural limitation, and reception at considerably greater distances is possible, apart from any possible effect of reflection from the ionosphere.

The use of wave lengths of only a few centimetres has been developed to some extent for point-to-point communication, mainly to bridge rivers and comparatively narrow stretches of sea. Such waves have the particular advantage that it is possible to focus the radiation into a very narrow beam which, on the one hand, gives increased efficiency of transmission, at the same time providing a considerable degree of secrecy of communication.

Wave lengths below 10 metres have been particularly studied by those interested in aircraft on account of the fact that the efficiency of propagation of such waves is high when there are few obstacles in the path, and because the apparatus necessary, in particular the antenna, can be of very small dimensions. The latter fact has also led to the study of possibilities for other mobile services, such as police cars and fire services. Another very important use to which these ultra-short waves have been put is for various types of navigational aids for aircraft, including "blind landing" devices for aeroplanes approaching an aerodrome in fog.

Arising from a study of the behaviour of wireless waves, considerable advances have been made in antenna design, particularly for wave lengths below about 600 metres. The waves most commonly in use throughout the world for broadcasting services lie between 200 and 550 metres. The chief limitation to the range of high-power stations of this type has been found to be due to the phenomenon of fading caused by interference between waves travelling along the surface of the earth and those reflected at night from the ionosphere. In order to minimize this effect, it has been found desirable to increase the strength of

BEERMUG TRANSMITTER opened

RADIO TUBE TESTER that can be carried as conveniently as a suit case

PORTABLE TRANSMITTER for relaying radio broadcasts from convention floors, street crowds or other places impractical to reach by wire

CONE-CENTRIC TUNING SYSTEM which provides automatic, mechanical accuracy for proper tuning

DRIVERS IN A TROTTING RACE communicate with each other by means of miniature, portable, radio broadcasting transmitters

the ground wave by every possible means, and to reduce the upward travelling components which eventually become reflected and returned to earth. What are known as mast antennae have come into almost universal use during the past three years for all important broadcasting stations in the wave band mentioned above. The radiator in this case consists of a single insulated mast, the design of which varies very considerably. The principle in all cases is similar, and depends on the fact that the radiator has a physical height of approximately  $\frac{1}{6}$  of the wave length being transmitted.

For the short waves used for long-distance communication depending on reflection from the ionosphere, much research has been carried out on the efficient design of radiating systems which confine the energy to a definite beam projected at precisely the correct horizontal and vertical angles for maximum efficiency of reflection. In the case of point-to-point commercial stations, these beams are made just wide enough to ensure covering the receiving point at the distant end, while in the case of broadcasting stations intended for long-distance reception, the width of the beam is adjusted to cover the distant area aimed at, which in general necessitates the use of a less confined beam.

The problem of the reduction of the ether space occupied by each transmitter has been approached in two ways. The first has consisted in devising means of maintaining extreme accuracy of the wave length emitted by each transmitter. It is now common for a large broadcasting station to maintain an accuracy of the order of one part in 1,000,000, while in the case of smaller stations it has become normal to operate with an accuracy exceeding one part in 100,000.

The effect of stability generally is that wave length channels can be placed closer together without danger of interference, due to wandering carrier waves.

Similar, but less spectacular, improvements have been made in connection with mobile transmitters, such as those which are used by ships.

The second method of reducing the ether space occupied has been so far applied mainly to commercial telephone stations, and consists of suppressing the modulation frequencies on one side of the carrier frequency. Again, in some cases multiplex transmission has been adopted whereby one carrier wave is modulated by several groups of frequencies, each providing a separate service.

During the last few years, success has been achieved in connection with the synchronizing of several transmitters separated by distances as small as 150mi., where the carrier waves are locked together by some form of telephone line connection, so that they remain exactly, or very nearly exactly, in step. In such cases it has been found essential that the same program shall be radiated from all the stations in a group.

(See also ADVERTISING; AIRPORTS: *Safety*; BROADCASTING; TELEVISION.) (N. As.)

**Radiotherapy.** There are many diseases which can be successfully treated by means of X-rays or gamma-rays, but the most important, by reason of its widespread frequency and high mortality, is cancer. The cure of cancer is so dominant a problem today that the radiotherapy of non-malignant conditions must necessarily take second place. Most of these non-malignant conditions, however, such as ringworm, keloid scars, toxic goitre, tuberculous glands, actinomycosis, chronic mastitis, menorrhagia, respond well to such doses of radiation as entail no risk of permanent damage to normal tissues. It is quite otherwise with cancer, for which the dose of radiation necessary for the destruction of the malignant cells usually approaches and sometimes exceeds that which can be tolerated by the normal

tissues. Furthermore, while laboratory research into the biological effects of radiation is steadily gathering much fundamental information, it is seldom possible to apply directly the results of such research to clinical radiotherapy. In practice, therefore, methods of radiotherapy are still largely empirical, and since patients with cancer must be followed for at least five years before the results of any one method can be evaluated, comparison between different methods is a slow process. However, certain principles in the radiotherapy of cancer are now generally accepted: (1) The dose of radiation administered shall be expressed in the international physical unit called the roentgen (r). (2) In order to minimize the damage to the skin and normal tissues, multiple ports are used, the beam of rays being accurately directed towards the tumour through each skin field. (3) Since in general the normal tissues recover from the damage produced by a dose of radiation more quickly than cancerous tissues, the total dose is fractionated over a period of some three to 10 weeks, the interval between successive doses (usually 24 hours) allowing the normal tissues to recover relatively to the malignant tissue. (4) The lethal dose for a carcinoma varies from some 3,000r when administered over a period of three weeks, to 8,000 or 10,000r over a period of 10 weeks. (5) In order to obtain, at a deeply situated tumour, the highest possible percentage of the radiation delivered to the skin, the most penetrating rays available are used.

The time-intensity factor (the number of fractions in which the total dose of radiation is given, the interval between these fractions, the total period over which they are spread, and the intensity or dosage-rate at which each fraction is administered) allows of innumerable variations of technique in the administration of a given tumour dose. In spite of the able way in which Coutard maintains that a dosage-rate of 3-5r/min. is the most important single factor in the successful treatment of radio-resistant carcinomata, it will be many years before finality is reached on this question.

The penetrating power of a beam of rays increases as the average wave-length of the beam becomes shorter. The average wave-length of a beam of "hard" gamma-rays is  $10^{-10}$ cm., while that of the X-ray beams in general use today from tubes operated at 200kv. is  $9^{-10}$ cm. Since the wave-length of X-rays is inversely

PRELIMINARY HAND-SORTING of radium ore at Eldorado, the world's richest radium mine, on Great Bear lake near Radium City, Canada

proportional to the tube voltage, much technical research in recent years has been directed towards producing X-ray apparatus operated at "super-high" voltages. Three such apparatuses working at a million volts, were brought into clinical use during 1937 (the Sloan high-frequency generator at Columbia, the Van de Graaff static generator at Boston, and the Metropolitan-Vickers direct-current generator in London), while there are now a number of apparatuses working at 500-800kv. in various countries. Preliminary clinical reports suggest that the normal tissues are less injured by, and recover more quickly from, a given physical dose of "super-high" voltage X-rays than from the same dose of 200kv. X-rays, while the cancer is relatively more injured.

The early clinical results thus appear to be better with higher voltages, but it will necessarily be some years before large enough five-year statistics are available for definite conclusions to be drawn.

As regards the results of radiotherapy, those available today refer to patients treated five years ago or more (and many advances have been made since then), and refer also mainly to cancers which were too advanced or too inaccessible for surgical removal.

On such unpromising material, the larger radiotherapeutic centres can show some 10% five-year cures; but when earlier cases which are still surgically operable are treated by radiotherapy, its results are in most cases superior to those of surgery; e.g. carcinoma of the cervix uteri, 50% (Regand); cancer of the tonsil, 37.5% five-year cures (Berven).

Such results make it probable that even so accepted an operation as that for removal of the breast for cancer may be replaced in the next few years by radiotherapy, just as has been hysterectomy for carcinoma of the cervix.

In addition to the steady progress in radiotherapy as outlined above, experimental work with neutrons suggests that they may also in due course become a valuable therapeutic agent. The invention of the cyclotron by E. O. Lawrence has made available for experiment beams of neutrons comparable in intensity to the X-ray beams in clinical use, and preliminary biological results have shown that neutrons are several times more effective than X-rays in equivalent doses. Furthermore, neutrons are the most powerful agent known for making elements artificially radioactive, so that it may be possible in the future to produce within

ELDORADO MINE, 26 miles from the Arctic circle, produces  $3\frac{1}{2}$  grams of radium a month and has cut the price from \$70,000 a gram in 1933 to \$40,000 in 1937

**DUST-MASKED WORKERS** bag 11 tons of uranium concentrates, reduced from 550 tons of ore and from which one gram of radium is recovered

the cancer itself sufficient radioactivity to cause its destruction. (R. PH.)

**Radium.** When the world's supply of radium was obtained from the comparatively lean ores of Czechoslovakia, the United States, Australia and Portugal, the price of the product was \$100,000 or more per gram; the discovery of much richer ores in the Belgian Congo brought the price down to \$70,000, and with the collapse of world buying power in 1929 it was reduced to \$50,000; recently new deposits of unparalleled richness have been discovered in Canada, and since the construction of a refinery for their treatment the price has been cut to \$40,000. Production of refined radium salts began in

Canada in 1933, with 3.0 grams of radium content, but later additions to the refinery have greatly expanded the operations, and at the end of 1936 production was at the rate of 2.5 grams per month; in the year 1937, the production of the plant totalled about 30 grams. The entire output is shipped to England for measuring and packing into treatment needles, after which much of it is returned to Canada for sale. Although the radium-bearing ores of Colorado and Utah have been mined on an increasing scale during the past two or three years, this is primarily for their vanadium content, and little radium is recovered. (See also **CHEMISTRY, APPLIED**; **VANADIUM**.) (G. A. Ro.)

**Railroad Accidents:** see **DISASTERS**.

**Railroads.** The railroad year 1937 in the United States was one in which eight months of steady improvement in earnings and hopeful outlook were followed by four months of sharply declining traffic and of serious apprehension. During the first half of the year the general view was that after seven lean years the period of famine was over and that the years of plenty had begun. The sudden September drop in freight revenues, and the arrest of the upward trend in passenger revenues, upset forecasts and programs, and necessitated retrenchment in both operating and capital expenditures. It accentuated the financial distress of the railroads which had just escaped bankruptcy and added to the degree of uncertainty as to the future.

On the expense side the situation was affected adversely by nationwide wage increases, the result of negotiations between the railroads as a whole and the labour unions collectively. The negotiations were begun before the recession in business activity was apparent but the higher wage rates became effective after the drop in railroad earnings had set in. On the basis of the number of employees in service in 1937 the wage increases added about \$130,000,000, or nearly 7%, to the annual wage payments of all railroads.

During the early part of the depression the Interstate Commerce Commission had granted, for a limited period, what were known as emergency surcharges. From time to time the period in which such surcharges could be made was extended; but at the close of 1936 the Commission decided that an emergency no

**A TINY GLASS TUBE** holds \$4,000 worth of radium, 100 milligrams

longer existed and the surcharges, with their annual additional revenues of \$120,000,000 (about 3.6%), were withdrawn. Shortly thereafter the railroads appealed to the commission to restore permanently a part of the emergency rates and in the spring and fall of 1937 the Commission authorized increases which were estimated to yield \$50,000,000 (about 1.5%) yearly. By that time the recession had set in, certain wage increases had been granted, others were pending, the prices of fuel and other materials and supplies had advanced, and the Commission in passing upon and granting the petition in part virtually invited the railroads to come back for more. The implied invitation was immediately accepted and in November the railroads petitioned for authority to increase freight rates about 15% and, in certain sections of the country, to advance the rate for passengers in coaches from 2¢ to 2½¢ per mile. The hearings began in Dec. 1937, and decision is expected in Feb. 1938. If granted in full the additional revenues will probably just about cover the higher costs of labour and materials.

At the beginning of 1937 93 railroad companies, operating about 30% of the total mileage, were in receivership or were operated by trustees. Three additional companies were added during 1937. Amendments to the Bankruptcy Act in 1933 and 1935 were intended to expedite railroad reorganization. They have not accomplished their prime purpose, but considerable progress has been made. The outlook at the close of 1937, however, was that the reorganization plans then under consideration would require revision to take account of reductions in prospective earnings, and that several other railroad companies which have been

**URANIUM CONCENTRATES**, transported 3,500 miles to Port Hope, Ontario, are boiled in acids to separate the radium

close to bankruptcy will be forced into it unless business conditions improve and rate increases are granted.

Railroad gross revenues reached their peak in 1929 when, for class I roads (those earning \$1,000,000 or more) they were \$6,280,000,000. In 1933, the worst year of the depression, they fell to \$3,095,000,000. By 1936 they had rebounded to \$4,053,000,000. If in 1937 the revenues in the second half had been as good as they were in the first half, the total for the year would have been about \$4,515,000,000, but because of the slump in the second half they will be but little better than in 1936.

The relationship between net railway operating income and the investment in road and equipment (expressed as "per cent return on investment") is a significant indication of earning power. In 1929 it was 4.81%; in 1934 it was 1.78%; and in 1936 it was 2.57%. During the first nine months of 1937 it was at the annual rate of 2.47% and for the full year it will be somewhat less. Considering all railroads collectively as a single system the income available for interest and other fixed charges will be but slightly in excess of those charges and practically nothing will be left for the stockholders.

In the operating features of railroads the year 1937 has witnessed further substitution of modern streamline equipment for locomotives and cars of conventional design, but the extent of such substitution has been small. The development of the Diesel locomotive has been matched by further improvements in steam locomotives, and some of the railroads are meeting the popular demand for modernity by converting steam locomotives into streamline design. In general the trend toward higher speeds, both in the freight and passenger services, and further improvements in quality of service have continued, and the design of passenger cars is along lines of more comfort, convenience and beauty.

The construction of new railroad mileage in 1937 was negligible but there have been many abandonments of branch lines which have long been unprofitable. A single example is found in the case of the New York, New Haven & Hartford railroad, under reorganization since Oct. 1935. In 1936 and 1937 the company was authorized by the Interstate Commerce Commission to abandon 97mi. out of a total of 2,034 and the Commission's examiner has recommended the abandonment of 177 additional miles.

This reference to abandonments suggests one of the major problems of railroads—the high degree of obsolescence and unused capacity. By far the greater part of the existing railroad mileage was constructed when railroads had a virtual monopoly of inland transportation and the policy of most of the railroads up

CLASS I RAILROADS, United States: Revenue passengers carried one mile

to the period of the World War, and in smaller degree between 1920 and 1930, was to keep their facilities and equipment ahead of the demands of increasing traffic. The potential threat of high way transportation was not realized early in the post-war period, and now that its full force is apparent, together with the competitive effect of the rejuvenated inland waterways and the rapidly developing aeroplane service, the railroads find themselves with facilities and equipment which in disturbing degree are not used nor useful. These surplus facilities and equipment are carried as assets for capitalization, largely in funded debt, for which no sinking funds have been set up. The railroads, therefore, are not only required to meet interest charges on bonds secured in part by non-productive property but also will have the heavy burden of meeting the principal payments at maturity.

A brighter side of the situation is found in the new spirit of the railroad executives. They are showing more resourcefulness in dealing with competition, in modernizing their sales and operating policies, and in improving their public relations. There is evidence that the competitive peak of highway transportation has been passed. The trucks and the buses are now being subjected to regulation in some degree equivalent to that imposed upon railroads. The general public is showing a more definite realization of the importance of maintaining the railroads as a vitally essential part of the national transportation system and has been sympathetic and helpful in its attitude toward the pending applications for authority to increase rates. (See also INTERSTATE COMMERCE COMMISSION; LABOUR ARBITRATION.) (W. J. C.)

**Great Britain.**—The year 1937 witnessed the opening of the electrified services between London (Waterloo) and Portsmouth by the Southern railway and the new high-speed "Coronation" trains between London (King's Cross) and Edinburgh by the London & North Eastern railway, a direct result of the financial success of the same railway's streamlined "Silver Jubilee" express between London and Newcastle, inaugurated in 1935. The "Silver Jubilee" in two years ran over 260,000mi. or 2,680mi. each week, at an average speed of over 67m.p.h., and, like many of the world's highest speed trains, its reputation for popularity, and punctuality is excellent. The latest high-speed streamlined express is the London & North Eastern railway's "West Riding Limited," which commenced service in Sept. 1937. Another similar type of train, but of slower speed, giving dining-car service to every seat, is the London & North Eastern railway's "East Anglian," running between London, Ipswich, and Norwich.

Useful as may be these individual high-speed trains, a general policy of acceleration is perhaps of even greater importance, and, in connection therewith, the entire recasting in 1937 of the London Midland & Scottish railway's (Midland Division) expresses between London, Leicester, Nottingham and Sheffield, may be

LONDON AND NORTH EASTERN RAILWAY LOCOMOTIVE "Commonwealth of Australia" on the "Coronation" express

DIESEL-MOTORED, STREAMLINED "City of Los Angeles," the 17-car train running between Chicago and California over the North Western and the Union Pacific railroads

quoted, or the Southern railway's hourly electrified services between London and Portsmouth which virtually doubled the frequency offered by the steam service now replaced. The Great Western, for many years noted for its high speed achievements, placed in service in 1935 the "Bristolian," thereby reducing materially the time between London and Bristol, and its "Cheltenham Flyer" continues to be one of the world's fastest trains.

To achieve these steadily increasing speeds with due regard to economy in fuel consumption, large numbers of new locomotives have been required, and in their policy of standardization the British railways have placed no fewer than 6,787 steam locomotives in service since 1923, the year the British railways were amalgamated into four large systems. The total steam locomotive stock at the beginning of 1937 was 19,817 as compared with 11,817 in 1923; on the other hand, electric motor vehicles have risen from 631 to 1,536, entirely due to the extension of electric traction on the Southern railway.

It is estimated that the work done in 1937, as measured in terms of passenger-miles and freight ton-miles, will closely approximate to the figures for 1923; thus similar work is being done with a much smaller number of motive power units. On the other hand, the gross receipts derived from passenger and freight traffic were, in 1936, 19% below the 1923 figure, but this was largely offset by a 19% decrease in the comparative expenditures. The railways' ownership of cross-Channel steamer services, docks, and hotels did not prove as remunerative in the latter year, with the result that the net revenue, namely, the sum available for payment of interest on capital, was only £35,700,000 in 1936, contrasted with £45,600,000 in 1923, or 3.27% expressed as return on capital in place of 4.40%. The results for 1937, when available, should show considerable improvement on 1936.

Consistent progress has been made during ten years in the renewal of running lines in accordance with the standards decided upon after the amalgamations of 1923. Recent and noteworthy developments include the use of a two-bolt fishplate in place of the much more expensive and heavier four-bolt fishplate; the employment of rail lubricators to lessen wear on curves, the careful attention to the superelevation on approaches to curves to ensure high-speed running with comfort and the building up of worn crossings by means of welding. The London & North Eastern rail-

way has made experiments with long rails of 120ft. and the Southern railway has laid, in certain tunnels, rails of 180ft., formed by welding three standard 60-ft. rails together.

The tendency in passenger coaches has been to employ steel more extensively both in strengthening the underframe and the vestibules; it is also used for the elliptical roofs and for the thin external panels. Of a modern British carriage which weighs about 30 to 32 tons, approximately 75% to 80% is steel. Mass-production methods are employed for locomotive, carriage, and wagon building. Concentration has been made on the production of standard type locomotives, but among new designs may be mentioned the London Midland & Scottish railways "Princess," Pacific type class, the streamlined 3-cylinder "Pacific" and the Mikado type "Cock o' the North" engines on the London & North Eastern, the very efficient "Castle" class on the Great Western railway and the successful "Schools" class 4-4-0 type on the Southern railway.

Legislation in 1928 permitted the railways to acquire a financial interest in road operating concerns, and about £9,000,000 has been invested in omnibus companies and well over £2,000,000 in cartage companies, for instance, Pickfords and Carter Patersons. All railway receipts from competitive sources are now pooled and, in addition, all passenger receipts in the London area are pooled with the London Passenger Transport Board. There has been a steady downward trend in the general level of railway charges owing to the grant of additional exceptional rates and reduced fare facilities, but an increase of about 5% took place in Oct. 1937,

CLASS I RAILROADS, United States: tons of freight carried one mile

DEMONSTRATION OF A CENTURY of British railway progress. Left to right: the "Lion," 1837; "Coronation," 1911, commemorating the crowning of George V and Queen Mary; and "Coronation," 1937, that of George VI and Queen Elizabeth

after permission was granted by the Railway Rates Tribunal. The only important exceptions to this increase were fares in the London area and charges for very short distances.

**France.**—The year 1937 will prove outstanding in French railway history because of the decree of August 31, which provided for the formation of the French National railway company as from Jan. 1, 1938. This new company is an amalgamation of all the main-line railways, both the company owned and operated Est, Nord, Paris Lyon et Mediterranée, Paris à Orléans and Midi systems, as well as the two State owned and operated railways known as the État and the Alsace & Lorraine. The French Government holds 51% of the shares of the new concern, which has a capital of 1,419,412,000 francs, but the companies still exist and remain in control of their so-called *domaines privés*.

Energetic steps, including the raising of fares and freight rates, were taken to reduce the long-growing deficit which had accumulated to over 26,000,000 francs by the end of 1936. Technically, the French railways are well to the front, both in regard to rolling stock, permanent way and signalling, whilst a special characteristic has been the rapidly extending use of railcars, some of a very high-speed nature, which total over 500 units. The main line from Paris (Montparnasse) to Le Mans was electrified in June 1937, as was later in the year the important suburban line from Paris (Luxemburg) to Massy-Palaiseau. The work of M. Chapelon of the P.O., in improving steam-locomotive design and efficiency, has placed France in the van of progress in traction matters, and the P.L.M. has acquired one of the largest Diesel locomotive units in Europe.

**Germany.**—Early in 1937, an important change in the organization of the German railway was announced with the appointment of Dr. Julius Dörpmüller, the general manager, as Minister of Transport. Whereas all methods of transport now come under the direct control of this minister, the new organization ensures that there is a high degree of co-ordination between the rail, road, water, and air services. Since the construction of the *Reichsautobahnen*, or motorways, has been entrusted to officers of the German railway, and the motorways are used extensively by German railway fast buses and trucks, the centralization of direction has been carried much further than in other countries. The welcome recovery in trade and industry has enabled the German railway to continue on a large scale its program of improvements covering both the operating and technical depart-

ments, and the financial results for 1937 will show a more satisfactory position than in 1936, when the ratio of operating expenditure to gross receipts stood at 88% and 95½% in 1935.

**Holland.**—High-speed Diesel trains are now operating extensively between Amsterdam, Utrecht, Rotterdam, and Eindhoven, whilst the Utrecht, Amsterdam, Rotterdam triangle is being converted to electric traction.

**Italy.**—Extension of electric traction proved the outstanding feature of State railway progress in 1937; specific mention may be made of the section from Naples to Reggio. New streamlined Diesel and electric trains were placed in service, permitting many services, such as Bologna, Florence, Rome, and Naples to be accelerated.

**Scandinavia.**—Of vital importance to the Danish State railways was the opening of the Storstrøms bridge in Sept. 1937, 10,535ft. long, the largest over-water bridge in Europe, following, as it did, the completion of the Little Belt bridge, 3,865ft. long in 1935. A third big bridge, the Odde Sund, about 1,650ft., is to be opened in 1938. These bridges, together with the use of high-speed Diesel trains of three or four cars, have improved internal and international railway services in Denmark.

In Sweden, the 81½-mi. Inland Line from Kristinehamn northwards to Gällivare was in 1937 opened throughout by the State railways, and conversion to electric traction still goes on steadily, the latest sections under conversion or planned are between Änge, Storlien, and Boden, and from Gothenburg to the Norwegian border. Norway is still among the few countries constructing main-line railways.

**Asia.**—In India, probably the most important event in 1937 has been the report of the Indian Railway Inquiry Committee recommending various changes in the policies to be adopted in regard to railways and their relationship to the finances of the Central Government. India and Ceylon are making experiments with Diesel traction which has already been proved satisfactory in Siam. The Burma railway system is now separated from the control of the Indian Railway Board.

Four decades' work of planning and railway construction in Indo-China has resulted in the completion of the Saigon-Hanoi line of 1,100 miles. In China, itself, and Japan, as well as in south Manchuria, railway progress has been temporarily stayed by unsettled political conditions, but the ex-Chinese Eastern railway has been converted to standard gauge from the wider

Russian gauge.

A further link, namely, from Nisibin to Tel Kotchek, has been completed in the line planned to connect the Iraq and Turkish State railways.

Steady progress is being made with the Iranian railway commencing at Bundar Gaz on the Caspian sea, and destined to reach the Persian gulf at Bundar Shapour via Teheran and Hamadan. There is also a railway on the Russian gauge from Erivan to Tabriz. The Soviet railways in Asia have been extended, and much mileage has been doubled.

**Africa.**—The Egyptian State railways have placed in service several Diesel railcars notably on the new direct line between Cairo and Suez, also between Cairo and Port Said, and Cairo and Helwan. A new branch line was completed in record time, stretching westward to Mersa Matruh near the Libyan border.

In West Africa, the Gold Coast and Sierra Leone Government railways have achieved better financial results through trade recovery, particularly in cocoa, palm kernels, and ore. The new French line has been opened to Brazzaville. The Benguela railway was completed throughout in 1931, thus opening up a new route between the Atlantic ocean and Central Africa.

In East Africa, the Kenya and Uganda railways have benefited from good traffics and economical operation. The most notable event of recent years was the completion of the Zambesi bridge in 1934, thereby connecting Nyasaland with Beira and avoiding ferry services at Chindio. The bridge itself, 12,064ft. long, cost about £1,400,000, but the approaches more than double this figure.

The prosperity of the South African railways and harbours administration during the years 1935-37 has been phenomenal, and rolling-stock has had to be ordered and built in large quantities to carry the heavy traffic offering. A total of 559 route miles, or 1,064 track miles, will be operated by electric traction in 1938.

**Australasia.**—In South Australia, a new line was opened by the Commonwealth railways between Port Augusta and Port Pirie, thereby eliminating the break of gauge at Terowie, and reducing materially the journey time between Adelaide and Western Australia. In Victoria, the new "Spirit of Progress," an all-metal air-conditioned train, has set a new standard in comfort as well as providing an accelerated service from Melbourne to Albury on the New South Wales border. New South Wales is making experiments with Diesel traction on the Broken Hill and other lines, while in all the States, trade recovery has enabled the railways to earn a much more satisfactory return on the capital invested in the systems.

In New Zealand, railway progress has been particularly noteworthy. Internal-combustion engined railcars have been found very satisfactory on light traffic lines, the new station at Wellington provides many unique features. A number of important new links connecting the various sections of line, for instance, from Napier to Putorino, and new Pacific-type locomotives have enabled considerable improvements to be effected in the train services.

**Notable Runs.**—The outstanding feature of railway progress since 1930, in spite of the world trade depression, has been the rapid advance in speed throughout the United States and western Europe. The German railway with its "Flying Hamburger" and the American railways with their Union Pacific and Burlington "Zephyr" streamlined trains of 1933 may claim to be the pioneers, but, whilst many of these and succeeding trains have achieved world fame, the general speeding up of large numbers of important passenger and freight trains is of even greater social importance. The period 1933-38 will definitely be regarded as a landmark in the realm of railway acceleration. The aim of many American and European railways is to bring the level of their express train speeds up to 60m.p.h., unless the distance between station stops is

too short to permit of adequate acceleration and braking.

To achieve the highest inter-station speeds now regularly scheduled, most of the world's fastest trains are strictly limited in weight and, consequently, in carrying capacity. Any table designed to show the world's highest speed railway runs must necessarily become rapidly out of date, as timetable changes are usually made twice yearly. Many such trains only run on certain days of the week, others run in the summer only, most of them are streamlined in varying degrees, and many of the fastest use the Diesel engine as the source of traction. In continental Europe some of these trains consist of one, two, or three cars only, and, therefore, are strictly limited in their number of seats.

The following table gives data as to certain of the fastest trains in the world operated regularly during 1937. Many railways impose strict limits as to the maximum speeds to be attained. The British railways are an exception to this rule, speed limits being imposed only at certain places. To obtain a throughout average speed of, say, 70m.p.h., it may be necessary to run several miles at any speed between 80 and 100m.p.h. In contrast to these regular runs, ultra-high speeds have occasionally been obtained on test runs, for instance, 124m.p.h. by a steam-hauled train between Berlin and Hamburg in 1936 and 113m.p.h. by the London & North Eastern railway and London Midland & Scottish railway in 1936 and 1937 respectively.

How greatly the railways of the United States have outstripped European railways in speed achievements since 1933 may be seen from the following tabulation:

Approximate Daily Mileage of Railway Runs at High Speeds

	70 m.p.h. and over	60 m.p.h. and over
Belgium . . . . .	..	839
Denmark . . . . .	..	741
France . . . . .	2,016	14,678
Germany . . . . .	1,504	8,235
Great Britain . . . . .	730	11,038
Italy . . . . .	131	1,317
United States . . . . .	3,194	37,860

**Ravel, Maurice** (1875-1937), French composer, was internationally known through such works as *Daphnis et Chloe*, *Pavane pour une Infante Défunte* and *Bolero*. Noted for his ability at instrumentation, he composed opera, ballet and chamber music as well as pieces for piano, voice and orchestra. An account of his life and works may be found in the *Encyclopædia Britannica*, vol. 18, p. 997. Increasingly popular in recent years, he toured the United States in the 1927 season. In 1934 he became director of the American Conservatory of Music at Fontainebleau, but was forced to drop his activities because of ill health which resulted in his death in Paris, Dec. 28, 1937.

**Rayon.** Under the rules promulgated by the Federal Trade Commission of the United States and which came into operation in Oct. 1937, rayon is defined as a "manufactured textile fibre or yarn produced chemically from cellulose or with a cellulose base, and for thread strands or fabric made therefrom, regardless of whether such fibre or yarn be made under the viscose, acetate, cuprammonium, nitrocellulose or other process." This definition is modified in some countries, but as all man-made continuous filament textile threads sold on a commercial scale are produced by one or other of the four processes mentioned, the

RAYON AND SILK CONSUMED in the United States

definition may be taken as substantially correct for all nations.

The improvements effected in rayon during recent years are amazing, but it is not claimed even yet that the ideal textile fibre has been produced. The main objects of research today are to give it the warmth of wool or silk, and the strength of cotton, as well as to improve its elasticity and to combat the tendency to crease. Rayon is now being made, of a finer denier per filament than that of silk, and one type at least has been produced which is as strong as cotton. In Great Britain, one company is making elastic threads on its machinery. Three-quarters of the rayon produced goes into woven fabrics, just as three-quarters of the world's raw silk is used for hosiery, and rayon is now being used for the casings of motor tires. Further, it was a rayon sail which helped the "Ranger" to win the race for America's Cup. A special form of rayon influencing the whole of the textile trade is staple fibre, a yarn spun from short lengths of the continuous filament rayon, which has made rapid progress, as a substitute for, and in conjunction with, cotton and wool, and for producing speciality yarns and fabrics.

The raw material for rayon production has up to now been cellulose, but recent attempts to use as alternatives organic polymerization products are important. The use of casein for textile threads is not new, but the process has only recently been developed commercially. The estimated production of the Italian product "lanital," the chief type of casein yarn, for the 12 months ending Dec. 31, 1937, is 2 million kilos, and the production rights have been acquired for the United States, Great Britain, and other countries. From it, every class of fabric, from the flimsiest knitwear to heavy overcoatings is made.

The estimated world production of rayon in 1937 is 1,110 million lb. compared with 1,015 million lb. in 1936. The estimated production of rayon and staple fibre in the principal producing countries is:

	Rayon (in 1,000lb.)		Staple fibre (1,000lb.)	
	1936	1937	1936	1937
Japan . . . . .	277,000	320,000	45,800	130,000
United States . . . . .	277,625	300,000	12,400	17,500
Great Britain . . . . .	116,800	120,000	26,200	29,000
Germany . . . . .	105,000	117,000	85,000	150,000
Italy . . . . .	87,000	97,000	110,480	160,000

(See also CHEMISTRY, APPLIED; SILK AND SILK MANUFACTURE.)

**Rearmament.** After the World War the British forces were rapidly reduced, and the country returned to the traditional system of voluntary enlistment. The army was brought back to less than its pre-war size, which had naturally been much smaller than the conscript armies of the Continent. The air force, which had been built up to the highest level of any by the end of the war, was reduced to a skeleton—from 185 squadrons to 28, of which only three were available for the defence of the home country. With the Washington Treaty Britain gave up her long-standing claim to predominance on the seas, and agreed to a condition of parity with the next strongest naval power. But in 1923 a state of tension developed with Britain's former allies, when the French marched into the Ruhr. The British, making plain their dislike of this peace-time invasion of German territory, felt a strong sense of personal discomfort when they awoke to the fact that a considerable part of France's 126 air squadrons were assembled within reach of their own coast.

The outcome was the announcement by Mr. Baldwin in 1923 that, apart from overseas requirements, British air power must include a home-defence force of sufficient strength adequately to protect the British people against air attack by the strongest air force within striking distance of England. He stated that the force was to consist of 52 squadrons, to be created as quickly as possible. The expansion started promptly, but was checked in 1926 when still a long way from completion. Three years later the official spokesman of the air ministry disclosed to Parliament that Britain had sunk to fifth place among the world's air Powers. Yet the incomplete program was again suspended, first to meet the economic crisis, and then to meet the hopes of a general limitation raised by the disarmament conference which assembled in 1932. During these years all service expenditure had been steadily pared down.

The strengthening and re-equipment of the British defences continued to be postponed so long as some hope, if a diminishing hope, hung on the Disarmament Conference—although well before this the continental powers and Japan had obviously begun rearmament. The pace of this quickened with the advent of the Nazi government in Germany and its unconcealed measures. Eventually the British government took account of the danger, and made a detailed examination of the state of their own forces. The immediate result of this enquiry was that in July 1934 the government adopted a five-year program for increasing the air force, and raising the home defence part of it to 75 squadrons. They were soon led to quicken their step, and shorten the time of their program, owing to evidence of Germany's rapid development in the air and the expansion of other air forces. Ground defences against air attacks were also increased. Two territorial infantry divisions were converted into anti-aircraft troops, to man a long belt of defence running from the south coast up the east coast, so that it would cover the north-country industrial areas as well as London. A research committee of scientists was also formed to study new means of countering attacks. At the same time that this immediate defence of Great Britain was thus taken in hand, extra money was provided for beginning the modernization of the army and navy.

The new program had barely been decided when a new series of shocks caused its upward revision. In March 1935 Germany announced her reintroduction of conscription and the formation of an army 50% larger than the French. It was followed by Hitler's intimation, to the British ministers who had gone over to Berlin for friendly negotiations, that Germany already possessed parity in the air with Britain and was aiming at parity with France—which meant a superiority to the prospective British air force. If there was some doubt about this first assertion, his second was

plain. The sequel was that in May 1935 the British government decided to raise its own intended air strength by 50 squadrons, and to have a home defence of 1,500 first-line machines within the next two years. This involved the training of 2,500 new pilots as well as of 20,000 other personnel. Although still hoping for any agreed limitation, the British government was no longer content to let preparedness wait on hope.

The process of expansion suffered some disturbance from the international crisis caused by Italy's invasion of Abyssinia. The emergency reinforcement of the forces in the Mediterranean was a severe drain on home resources, which emphasized the consequences of past neglect and revealed defects in the planning. After a vigorous campaign initiated in *The Times* which found wide support, the government yielded to the weight of public opinion, and in March 1936 appointed a minister for the co-ordination of defence, who would act as the prime minister's deputy on the Committee of Imperial Defence, preside when necessary at the meetings of the chiefs of staff of the three services, and would also be in supreme charge of the supply organization and industrial planning. This was a step forward, if it did not go as far as was desirable.

Sub-committees have been set up to deal with the different items of munition supply, with the provision of raw material and its manufacture, with man-power, food-supply, and grain storage, as well as with such questions as the protection of merchant shipping, the development of anti-aircraft defence, and precautions for the protection for the civilian population in air raids. A detailed survey has been made of the industrial field, to examine and clarify the material, operative, and technical resources of the country. Hundreds of engineering firms have been inspected to see whether their plant is adaptable to munition production in war-time. Production for present needs, however, has been delayed by lack of the necessary machine-tools and gauges.

With the air force the interruption caused by the Mediterranean emergency was soon overcome, if not overtaken. The production of new types of machines, of much higher performance and greater range, has been speeded up so much that they are being delivered long before the date originally contemplated. The intended strength of the force at home has also been raised to 1,750 first-line aircraft, exclusive of the Fleet Air Arm. The creation of the new squadrons, however, has been slower. Of the 72 which were to be raised by the end of March 1937—to make a home defence total of 123—only about 26 were complete by that time, with a further 22 formed on a one-flight basis. The remainder were formed, but not yet at full strength, by the end of the year.

With the navy, which had a relatively lesser problem, the rate of construction was quickened to the extent that some of the new ships had been ready nearly half a year earlier than the scheduled time. Three of the new class of 9,000-ton cruisers are now completed and three more are expected to be ready within the next year; they have a speed of 32 knots and an armament of twelve 6-in. guns, as well as eight 4-in. anti-aircraft guns. Similar progress is being made with the building of destroyers. Two new 34,000-ton battleships were laid down in Jan. 1937, and three more have been authorized. Five large aircraft carriers are being built. And the completion of the Singapore base has been hastened, so that by the end of 1937 it was sufficiently advanced to be ready for emergency use. Early in 1936 the government decided to raise the cruiser strength from 50 to 70—the number which has for years been claimed as a necessary minimum by those directly concerned with the defence of the sea-communications: in 1914 there were 125 cruisers, new and old, available.

The situation is less comforting in regard to the deficiencies of the army. The belated official acceptance of modernization and mechanization caught its munition plants in a state of inade-

AIRCRAFT CARRIER "Furious" of the British Navy and a reconnaissance aeroplane during coast-defence practice manoeuvres

quacy for large-scale production, and a shortage of skilled labour aggravated the difficulty. While the motorization of its transport has made good progress, and light tanks have been coming through in rising numbers, only a trickle of the new anti-tank guns, light machine-guns, and anti-aircraft guns appeared in 1937. But production has been accelerated by the more vigorous impetus recently given to the war office machine since Mr. Hore-Belisha became secretary of State for war. (See also MUNITIONS OF WAR; WARFARE; WORLD ARMAMENTS.) (B. H. L. H.)

**Recession of 1937:** see FEDERAL RESERVE SYSTEM; LABOUR; RETAIL SALES; STOCKS; UNITED STATES: *Recession*, 1937.

**Reciprocal Trade Agreements:** see TRADE AGREEMENTS.

**Reclamation.** In the United States the meaning of the term "reclamation" has been restricted by usage so that its principal application now is to the reclamation of desert lands by irrigation. The United States Bureau of Reclamation, for example, deals solely with irrigation, and all of its work is in the arid and semi-arid western one-third of the nation.

In 1937 the total amount of land irrigated in the arid and semi-arid region, which encompasses within the United States about 700,000,000ac., was almost 20,000,000ac., of which about 3,000,000ac. were supplied with water by Federal projects. It is estimated that approximately two-thirds of all the lands which can

be watered with the limited supply available in the West is now developed.

The arid and semi-arid region receives rainfall averaging from 3 to 20 inches annually, insufficient generally to support tilled crops. When the gold rush to California in 1849 started the great westward migration into this area it was quickly realized that general agriculture there must depend upon irrigation. Mormon settlements in Utah a few years earlier had demonstrated the feasibility of irrigation, and the Spanish missions in California provided additional models.

At the outset, individual settlers built rude weirs and rudimentary canals to divert from unregulated streams for the irrigation of a single crop or a single farm. Soon, however, clusters of settlers were combining their efforts to provide small canal systems and more protection against the vagaries of the intermittent streams with which they had to cope. It was but a short step to co-operative effort on a broader scale. Irrigation districts and similar quasi-public bodies were formed to provide water for larger areas of land, and large stock companies and syndicates were organized to engage in the construction of irrigation works and the development of favourably situated tracts.

About 50 years ago, when it became apparent that regulation of the flow of the streams would be necessary in nearly all instances where large irrigation projects had evolved, and when it became apparent that the cost and size of the structures required to provide the needed storage would make them unattractive as private investments, Federal participation in irrigation development began to be agitated. In 1902 the Congress adopted the Federal Reclamation Act, and since that time the Bureau of Reclamation of the Department of the Interior has been the principal agency engaged in this type of improvement. Under the Reclamation law, the cost of the irrigation works must be repaid without interest in 40 years by the water users.

In 1937 the Bureau of Reclamation had under way its largest construction program, including some 21 dams, ranging in size from the great Grand Coulee dam on the Columbia river to comparatively small earthen dams on such rivers as the Pecos in New Mexico and the Little Truckee in California. Except for a few small projects in Montana which were being constructed by the State with Federal loans, all of the construction designed to irrigate new lands in the West was being done by the Bureau of Reclamation.

Prior to 1937 the bureau had built 138 storage and diversion dams and had provided homes for approximately 900,000 persons living on farms and in towns and cities established on the Federal projects.

The construction program under way in 1938 will eventually result in the irrigation of 2,500,000 acres of land now dry and unproductive, 1,200,000 acres of which are in the Columbia basin area to be served by Grand Coulee dam. Two tracts of public lands to which canals had been completed were opened for homestead entry during the year. One of these involved 106 farm units on the new Owyhee project in Oregon, and the other, 69 farm units in the Tule lake area of the Klamath project in northern California. The farm units were in great demand. When the Tule lake farms were offered publicly, more than 3,200 prospective settlers made efforts to obtain one of the 69 tracts.

Because of the control which irrigation gives in the application of water to growing crops, and because generally the growing season in the irrigation areas is comparatively long, the gross income per acre of farmers on these projects averages approximately two and one-half times the gross income per acre of the farmers the nation over. Surveys completed in 1937 show that an average gross crop value of \$47.10 was received by the farmers for each of the 2,901,919 acres irrigated by Bureau of Reclama-

tion project works in 1936.

(J. C. PA.)

**Great Britain.**—During recent years the increased capacity and effectiveness of dredgers and other power machinery has made possible some reclamations from the sea which without such aids would have been impractical and in some cases impossible. By the use of centrifugal pumps, water in which sand, and even much coarser material, is suspended, can be forced through large pipes to a considerable distance with a great saving of time and of labour costs. Land so reclaimed may be used for the creation of docks and harbours, for industrial sites, or for agriculture. Modern drainage systems and the obverse, irrigation, have also made available marsh and waste lands in many parts of the world.

In Great Britain, one of the most important reclamation works, the Southampton Docks Extension scheme has resulted in the construction of a quay wall, nearly 1½ mi. long, alongside which eight big ships of the line can be berthed. Beyond the quay wall is the new King George V graving dock, in which the largest vessel can be dry docked. The site, of an area of 408ac., was reclaimed from a tidal bay of the river Test. Before reclamation by dredging, the bay was a mudland, covered at high tide and bare at low tide. The overlaying bed of soft clayey mud, from 8ft. to 15ft. thick, was taken out to sea; a stratum of gravel, below the mud, from 2ft. to 7ft. thick, was used for making banks and for concrete; the sand and sandy clays, below the gravel, were pumped from barges through pipe lines to the area reclaimed after that area had been divided into basins protected from tidal action.

The approach channel is about 2mi. long and 600ft. wide, with turning basins at each end of the quay wall, its depth is 35ft. below L.W.O.S.T., but alongside the quay wall the berths are 40 to 45ft. below low water level. In the dredging of this channel 20,000,000 tons of material were removed. The whole scheme makes provision for an additional dry dock and for a jetty parallel to the near quay which will berth 12 liners. The reclaimed land is being used for docks accessories and for new factories and depots.

**The Netherlands.**—Although in the great work of reclamation of the Zuyder Zee, the north-western section (the Wieringer Meer polder) has already been converted into fertile land, with roads, bridges, canals, and villages, the work on the other sections has been held up for financial reasons.

It has now been decided to reclaim the north-eastern polder of what is now the Ysselmeer. The dyking and drainage of the polder is estimated to take about five years, and another five years will be required for the completion of the work. The surface of the land reclaimed will be 119,000ac. and the total cost of draining will be about £18,000,000.

**Germany.**—For a very long period the west coast of Schleswig-Holstein has been subsiding, and large areas of arable land have been lost. A 10-year plan for the reclamation of a part of this lost area is now in operation; this plan includes a total area of about 1,250,000ac. half of which is fertile marsh land, above mean water level, which only requires drainage and protection from storm; the greater part of the remainder consists of silt and sand between high- and low-water levels. These submerged portions are divided into large areas which are enclosed by stone-pitched dams, smaller enclosures are formed within these protected areas, and the silt, which has been deposited in a system of drains, is collected between tides and shovelled on to the land, making it fertile.

**Greece.**—The Salonika Plain, some 500 sq.mi. in area, was at one time a part of the Gulf of Salonika; in the course of centuries, the plain has been nearly filled by the alluvial deposits of rivers, leaving a shallow lake, known as Lake Genista, which in recent years had become an almost impenetrable mass of reeds. The

work of reclamation included the diversion of the river Axios and the systematic draining of the plain. By the diversion of the river, the Athens-Salonika railway has been protected and the delta of the river prevented from extending into the sea so far as to cut off the port of Salonika. About 108,000ac. of land has been drained and a further 198,000ac. been protected from floods. At Lake Copias, also in Greece, the reclamation by drainage of 60,000ac. has, among other benefits, brought a very considerable area of land into cultivation.

**Far East.**—A very notable work of reclamation has been the new Singapore civil airport, which was opened in June 1937, on a site reclaimed from a tidal swamp near the city. This swamp was covered with six feet of water at high tide, and at low tide there were extensive flats of soft mud which reached a depth of about 50 feet. The whole area was bunded off in blocks, varying from 10 to 25ac. in extent. After the blocks had been pumped dry, they were filled with layers of material from the hills, each layer being consolidated by the use of roller-tractors before the next layer was laid. In this way a very stable basis was obtained well above the tide level; the aerodrome portion was afterwards covered with fertile soil on which grass was planted. Slipways and an approach from the sea provide for seaplanes and flying boats.

(J. EU.)

**Recovery:** see BUSINESS CYCLES.

**Recruiting:** see REARMAMENT.

**Red Cross,** the internationally recognized symbol of agencies in various countries for the relief of sufferers in war and in civil calamities (in Islamic countries replaced by the Red Crescent). Particularly it is the device of the International Red Cross, formed in Geneva in 1864 to organize aid to the sick and wounded in time of war, and the League of Red Cross Societies, with headquarters in Paris, which undertakes welfare work in peace time. National Red Cross Societies in most civilized countries are affiliated to these organizations.

In the United States, the American National Red Cross administered extensive relief operations in connection with the Mississippi valley floods of the spring of 1937, giving assistance to over a million persons. In the year 1936–37 a total expenditure of \$25,985,000 was incurred by the American Red Cross in home and foreign relief work, and the society's national revenue amounted to \$29,167,000 besides the revenues of its 3,700 local chapters.

The British Red Cross Society is taking a prominent part in the campaign against rheumatism in Great Britain, and in 1936 at its clinics, 154,378 anti-rheumatic treatments were given, the provisional figure for 1937 being 145,592; 30,000 accident cases were dealt with during the year 1936–37, and on the day of the King's coronation, in May 1937, 944 officers and members on duty in London streets dealt with 1,428 casualties. Since 1935, the B.R.C., in common with the Order of St. John and the St. Andrew's Ambulance Association, have been training themselves and the public in the medical and anti-gas services that would be necessary in the event of air raids; they are now co-operating with the local authorities in the Air Raid Precautions Services, and up to the end of 1937 had passed 27,847 persons through their anti-gas training classes.

The International Red Cross Commission announced in Jan. 1937 that 35 national societies had contributed £23,000 to the relief of suffering in connection with the Spanish Civil War, three-quarters of that sum having been received from South America; delegations were at work in various parts of Spain, concerned mainly with revictualling and the care of the child population.

**Red River:** see MISSISSIPPI RIVER SYSTEM.

**Referendum.** The number of measures referred to United States voters in 1937, while fewer than in 1936 because fewer States held elections, was, nevertheless, considerable. In three southern States the liquor question was again referred; 24 of the 67 Alabama counties voting on March 10 to adopt the "Beverage Control Act" and the others rejecting it (total vote, 98,051 for; 100,474 against). In Georgia the attempt to legalize liquor traffic was frustrated (103,097 to 94,575) although on the same day, June 8, no less than 26 amendments of the State constitution were adopted. An advisory referendum on September 23 in Tennessee yielded 103,276 to 36,839 against repeal of the Prohibition law. A similar proposal was defeated in Verona, N.J. by one vote. New Hampshire electors, at the March town meetings, voted (20,064 to 19,852) to call a constitutional convention, following those of New York, in 1936, who, in 1937, adopted five out of six proposed amendments of the constitution, *inter alia* doubling the terms of governor and lt. governor (842,980 to 503,696) and assemblymen (856,818 to 463,074) and authorizing waiver of jury in non-capital cases (721,540 to 550,297). Texas voters also ratified five of six proposed constitutional amendments while those of Kentucky rejected all such proposals and Pennsylvanians all but one (authorizing old age pensions).

Nineteen Indian tribes voted (for the most part favourably) on tribal constitutions and 28 on charters, at various dates. On May 1, women of the Philippines (by special authorization, and for the first time in the Far East) voted themselves the franchise by a majority of about 10 to 1.

Outside United States territory, the first to use the Referendum in 1937 was Australia, on March 6. Under the Commonwealth Constitution's peculiar requirement that every amendment thereof must receive a majority in each State, as well as of the entire electorate, two proposals were defeated, although the second (authorizing the Commonwealth Parliament to regulate aviation) received a majority of the total vote. The new Irish Constitution was adopted on July 1 (686,042 to 528,296)—the first instance of such a referendum in the British Isles. The Swiss voters on November 28 rejected a proposed constitutional amendment (sponsored by Fascists) excluding secret societies from exercising the right of free association (514,984 to 233,869). Bulgarians voted on the question of allowing goats to be kept. Brazil's new constitution, though dictated and proclaimed, provides for "a national plebiscite" on future changes in case the chamber of deputies and the president fail to agree. (C. S. L.)

**Reforestation:** see FORESTRY AND REFORESTATION.

**Reformed Church:** see PRESBYTERIAN CHURCH.

**Refugees.** The 17th (1936) League assembly appointed Judge Michael Hansson, as president of the governing body of the Nansen office until Dec. 31, 1938, with the task of submitting a scheme for the liquidation of that office (as decided by the 16th assembly under Soviet pressure) by that date and for the allocation of its tasks after liquidation. This report was submitted to the 18th Assembly. During the year the office continued its work of settling Armenian refugees in Syria and Greece and refugees from the Saar in Paraguay.

The High Commissioner for Refugees (Jewish and other) from Germany (Major-General Sir Neil Malcolm) was instructed by the 17th Assembly to prepare for the winding-up of the work of the High Commission by the end of 1938. A draft international convention on the status of refugees coming from Germany was drawn up and submitted to governments in March 1937. This combined the stipulations of the Provisional Agree-

ment, between governments of July 1936, regarding such refugees, with the provisions of the Convention on the International Status of Refugees opened for signature in Oct. 1933, which was designed to cover those refugees who fell within the sphere of the Nansen office. The 18th Assembly instructed the High Commissioner to summon an inter-governmental conference early in 1938 for the adoption of a convention on refugees (and, if possible, stateless persons) coming from Germany.

The assembly considered the future of the work on behalf of the refugees, and confirmed its previous decision regarding the liquidation of the Nansen office and the High Commission at the end of 1938. It recognized, however, the League's moral duty towards the refugees, and decided that the whole problem arising out of these decisions should be re-examined, and asked the council to prepare a scheme of international assistance to refugees before the 1938 Assembly. (See also LEAGUE OF NATIONS.) (S. A. HE.)

## Regency Act.

On the accession of King George VI to the British throne in Dec. 1936, it became necessary to take steps to provide for a regency during the possible minority of the heir-presumptive. Advantage was taken of this fact to make good a slight defect that had become apparent during the illness of George V in 1928, viz., that there was no permanent provision for the carrying on of the royal function during the sovereign's sudden incapacity or absence abroad.

The terms of the bill, which received the royal assent on March 19, 1937, and to which the Dominions had agreed, provided, therefore, that in the event of the demise of the crown during the minority (i.e. under 18 years) of the heir-apparent or presumptive, and during any period when the sovereign was declared to be incapacitated by infirmity of body or of mind, the next adult heir should be regent, and should perform all the state duties and functions of the sovereign, the domestic guardianship of an infant sovereign being reserved to his or her mother, if living. It also provided that the sovereign (or regent), in the event of illness or of absence from the United Kingdom, should delegate certain of the royal functions to counsellors of state, these to be the wife or husband of the sovereign and the four adults next in line of succession. (L. H. D.)

## Relief.

The needs of the unemployed during 1937 continued to dominate the practice of relief in English-speaking countries as well as in the other industrialized nations of the world. In general, provision for the care of the unemployed is made by three methods: social insurance, public works or relief works, and home relief.

Great Britain employs social insurance; the United States, State by State, is beginning to do so; Canada, as yet, does not.

The British scheme, which has been in operation since 1911, covers most of the wage-earning population, including agricultural labourers, the latter group having been added to the classes of beneficiaries in 1936. In the United States, with the exception of Wisconsin, unemployment benefits had not begun to be paid but the collection of premiums was in its second year, and employers in the covered industries had paid 2% of their wage expenditures into the Federal Treasury. Coverage in the United States, however, is only about 45% of gainfully employed workers, due to the many exemptions provided in the Federal law.

Public work and work relief continued to be relied upon in large measure for the care of the unemployed during 1937 throughout the English-speaking world. Although England has formally renounced the method, yet her extensive public improvement schemes, such as housing, are based largely on the need for

"WHO WANTS TO LEARN TO FLY?" A perennial fledgling that won't leave the nest, as seen by Carlisle in *The New York Herald-Tribune*

jobs. The Works Progress Administration was the outstanding agency caring for the unemployed in the United States. During the year considerable public sentiment developed against it, and appropriations for it were reduced, but by December the Government added 350,000 to its rolls in accordance with its announced plans at the time of the spring reductions. Somewhat over 2,000,000 workers had been employed on WPA projects in January but this number had shrunk to 1,400,000 by September. At no time were all able-bodied dependent unemployed taken care of by work furnished by the Works Progress Administration. Special projects conducted by the Public Works Administration (a separate authority headed by the Secretary of the Interior) lend themselves less easily to tabulation, but they were, in general, of less immediate effect in coping with unemployment and less money was available than for relief work under WPA. It should, however, be added that many competent authorities consider economically and socially real public works a sounder approach to the problem of the unemployed, than work relief as promoted by the Works Progress Administration.

Training for the unemployed is given in vocational education centres in Great Britain, and in 1937 the Central Government recognized supplementary training and recreation projects, which had been carried on in over a thousand communities under voluntary auspices, by passing the "Physical Training and Recreation Act" which absorbs them into a new governmental unit with a budget of \$10,000,000. Nothing of the sort exists in the United States except the Civilian Conservation Corps Administration, which in September had nearly 200,000 boys in its camps. In both Canada and the United States sporadic efforts at training, vocational placement and recreation are undertaken under both public and private auspices, but the Dominion of Canada in 1937 made \$1,000,000 available to the provinces on a matching basis for a youth training plan.

## RELIGION

Direct relief to the unemployed has everywhere been separated from general relief, except in the United States, where after 1935 the Federal Government turned back this responsibility to the States. In England, on April 1, relief of the able-bodied unemployed was assumed by the new Unemployment Assistance Authority of Central Government, while general relief continued to be administered as it had been for over three centuries in all English-speaking countries by local units of government. In Canada, no change has taken place in the plan of Dominion subsidies to provincial Governments for relief of the unemployed to be used either for work relief or direct assistance. In the United States, the withdrawal of the Federal Government has in most States resulted in consigning the unemployed to the care of local Governments, most of which cannot or will not assume the responsibility, and consequently in many areas a family containing an able-bodied worker cannot get relief. A Bureau of Governmental Research in one mid-west city, after an independent investigation of a sample of the able-bodied unemployed from whom relief had been withdrawn, reported that the majority of these men were "entirely without means and few of them can expect to find employment in the labour market." A few States have assumed financial responsibility in whole or in part for the care of this group of dependents.

A significant development in the United States, though one long in effect in other countries, is what has come to be called "categorical relief"; that is assistance provided by law for certain defined groups, such as the aged, the blind, dependent children, etc. The Federal Social Security Act effective in 1936 makes provision for Federal aid to States and territorial divisions whose plans for such assistance have been approved by the Social Security Board, although it avoids the field of general public assistance. Up to Oct. 1937, 50 of the 51 jurisdictions had qualified for at least one of these provisions (Virginia alone having been accepted for none). Care of persons in these categories had been assumed by a number of States, although for the most part ineffectively for at least two decades, so the theory was not new, but the scale of application has been greatly broadened through Federal participation. During September nearly 1,250,000 persons were receiving assistance under these provisions to the amount of nearly \$34,000,000 per month.

UNITED STATES EMPLOYMENT SERVICE: applications in active file (—) and placements made (....)

TWO CONTEMPLATIVE EXPRESSIONS of Harry Lloyd Hopkins, head of Government relief activities, who believes the U. S. will have some 4,000,000 unemployed even in prosperous times

England cares for these groups through contributory social insurance, except that direct pensions are given on evidence of need in the case of aged persons who were too old at the inception of the plan to build up their own reserve or who were excluded from its benefits. Canada provides a non-contributory old-age pension on evidence of need, and some of its provinces have established permissive non-contributory aid to dependent children in their own homes.

Before the end of 1937, 30 of the 51 jurisdictions in the United States had set up new or reorganized their existing departments of public welfare to meet the requirements of the Social Security Act that the State either itself administer the program or assume supervision of local administration. A trend is developing toward centralization of both administrative and supervisory responsibility in State Departments of Public Welfare, which will probably result in greater efficiency and humanity in local care of the dependents.

During the past several years, private resources for relief have gradually decreased, either through lack of contributions or because of adoption by voluntary agencies of the principle that relief-giving is primarily a function of government. It has become generally recognized that the need for relief in the years since 1929 is far too great for private benevolence to meet. Private agencies have therefore been turning their attention to other fields of activity, such as child and family welfare, mental and social hygiene, recreation and vocational guidance. This gradual trend is true in all three countries under consideration. However, in the United States contributions to the community chests reporting to their national association increased 6% in 1937 over the previous year, or to a total of over \$83,000,000. (See also UNITED STATES: *Social Security and Relief*.)

(F. J. B.)

**Religion.** We may perhaps define religion as a conviction of the real existence of an unseen spiritual world, of which it is our privilege to be citizens, and which makes many demands upon us in the sphere of conduct. The religious man holds that the realm of values is as real as the realm of facts. He usually believes that the ultimate values are a revelation of the mind of a personal God, who is worshipped as the creator and sustainer of the universe.

It is often said that this instinct or conviction, which has been of immense importance through the whole of human history, is gradually losing its power over belief and conduct. In support of this, observers point to the decline in attendance at public worship, to the impotence of the churches to influence politics, to the agnostic tone of popular literature, and to the active anti-religious propaganda of revolutionary Governments. Persecution of a violent type, involving thousands of what in other ages would have been called martyrdoms, rages in Russia, Spain, Mexico, and in a much milder form even in Germany.

Since this "anti-God" agitation is just now prominent in the mind of the public, a few words on the subject may be appropriate. The conditions are not the same in the various parts of the world where it is active.

In Russia the Byzantine form of Caesaro-papism had made the church the subordinate ally of the monarchy. The majority of the parish priests were almost as ignorant and superstitious as their flocks. But there was and is a great deal of genuine mystical piety in the Russian people, and there is not much evidence of popular hatred of Christianity. The wish to destroy religion came from the doctrinaire Communists. Not only is the "dialectical materialism" of Marx incompatible with any form of religion, but no Christian could accept the exclusively economic interpretation of history, or share the fury which drives men to destroy every vestige of the old social order. The revolt was not directed against the abuses of the Orthodox Church. "The less corrupt a religion is," said Lenin, "the more necessary it is to destroy it."

Impartial observers do not think that this persecution will last much longer. Doctrinaire Communism has had its day, and the Soviet Government is approaching the Fascist type. The natural policy of such a Government is to make some sort of concordat with the church, as in Italy, gaining the support of the church in return for some measure of protection. Those who are making a revolution may hate religion; those who have made one are not likely to attack an institution which usually supports law and order. Nearly all the peasants have kept their icons, and it would be a great mistake to suppose that the Russian Church has been crushed beyond hope of recovery. Among the refugees there are theologians of world-wide repute, like Berdyaeff.

In Spain the conditions are too chaotic for any confident prophecy. The atrocities against the church have been terrible, but they are probably the work of turbulent gangs rather than of the Republican Government. Hatred of the church is intense among the workers in the towns and in the mines; but the Basques are practising Catholics, fighting, it appears, mainly for home rule. Many Spaniards are anti-clerical without being anti-Christian. They allege that while the church was wealthy and powerful it kept a stranglehold on education, and obstructed many necessary reforms.

Mexico is a semi-barbarous country, in which the large majority of the population are pure Indians or half-breeds. The peons were badly treated, and the church of their conquerors did little to help them. The present revolution is mainly an Indian revolt, and there have even been suggestions of a reversion to paganism, which will not be permanent. The future in Mexico is very obscure.

In Germany there is no wish to abolish the Deity, but to deify the State, a form of worship quite inconsistent with Christianity. The present situation is the result of what in modern jargon is called a resentment complex, exacerbated by fear of Bolshevism. But the worship of the God-State, which is no new thing in Germany, has taken firm root, and there is probably no task so pressing on all men of goodwill as to combat a doctrine which can have no other outcome than to plunge Europe into co-operative suicide.

In France the Conservatives tend to rally round the church,

which is too weak to excite much hatred even among the Radicals. In all Roman Catholic countries a man is generally either a practising Catholic or a freethinker, but there is more independent religion in France than in Spain or Italy.

Among non-Christian nations, the Turks have submitted to the disestablishment of their faith with surprising docility. In India the remarkable toughness of a religion based on caste is proof against all disintegrating tendencies. In China and Japan the official religions are said to be losing their hold, but authentic information is scanty.

In countries like Great Britain and the United States where there has been no revolution, the first question that arises is whether the neglect of public worship is a grave symptom of decay or not. The chief reason for it is that the spread of education and the easy access to cheap books and broadcast performances have made the laity independent of the ministrations of the clergy to an entirely new degree. Parts of the liturgy—where one is used—are thought to be antiquated by the majority who do not attend church, but they still satisfy the minority who do, so that reform is difficult. The same problem prevents a revision of the formularies of belief, which in their present forms no longer satisfy educated people. Liberal Protestantism has been partially undermined by a more drastic criticism of the sources; the newer modernism is more willing to accept the necessity of a mythical element in Christianity.

It has been said that the majority of English people believe in Christ but not in God. A kindly, good-natured humanitarianism, which gladly accepts the moral teaching of the Gospels, but without any well defined standard of values, is the lay religion of English people. An age of great material abundance and widely diffused comfort is likely to be one of tepid interest in the things that are not seen. The future, so far as the present writer can guess, is not likely to see a decline in the religion of Christ, but institutional Christianity may have to pass into new forms.

It is sometimes thought that the religions of authority have a better chance of survival than what Sabatier calls the religion of the Spirit. This is too large a question to discuss here. At present the most noticeable fact is, not the thin trickle of conversions to the Church of Rome, but the surprising popularity of freak religions and revivals, most of which have their origin in the United States. The younger generation, impatient with all that their elders have taught them, seem sometimes eager to found a new religion of their own.

(W. R. I.)

**Religious Denominations:** *see* CHURCH MEMBERSHIP.

**Republican Party.** Decisively defeated in the national elections of Nov. 1936, the Republican party entered 1937 with its representation in Congress reduced to 16 senators and 89 members of the House. Only seven States had Republican governors, and in State and local governments, the roster of Republicans holding elective office was comparatively small. The Republican task in 1937 was one of organization, rehabilitation, and the canvassing of methods by which the party, despite its meagre representation in Congress, could function as an effective opposition.

Following the Nov. 1936 elections, the National Committee reaffirmed its confidence in its chairman, John Hamilton. Mr. William R. Castle, former undersecretary of State, Mr. William Hard, and Miss Marion Martin, in charge of the women's division, were selected as Chairman Hamilton's principal assistants at national headquarters. Professor O. Glenn Saxon of Yale, was continued as Director of Research, and Leo J. Casey, a former newspaper man, was named director of publicity.

Election of Republican members to Congress in 1938 has been

"WHO'S TO DO THE DRIVING?" A problem in rival mahouts, as pictured by Seidel in *The Richmond Times-Dispatch*

the primary objective of the Republican national organization. Representative Joseph W. Martin, Jr. of Massachusetts served as chairman of the Republican congressional committee through the year, and Senator John G. Townsend, Jr. of Delaware headed the senatorial committee.

Through its research staff and the help of expert advisers, the National Committee has prepared factual studies on many current issues. These have been placed in the hands of Republicans in Congress. In the Senate, the minority leader was Senator Charles L. McNary of Oregon, and in the House, Representative Bertrand H. Snell of New York.

Among proposals advanced by Republicans in Congress during the year were those for an extension and strengthening of the present Social Security Act. Recommendations made by Republicans led to the establishment of a new advisory committee by the Social Security Board. The Republicans stressed the need for an improvement in the administration of Federal relief. House Republicans adopted a motion, embodied in a subsequent resolution, in favour of returning the actual administration of relief and work relief to the States, with the Federal Government paying 75% and the States, 25% of the total costs.

A Republican substitute was offered to the Administration's wage and hour bill, aimed to eliminate the proposed five man labour standards board, and to establish more simple standards of fixing minimum wages and maximum hours. Republicans in Congress also sought to give the Wagner Labor Relations Act a better balance by placing greater responsibilities on labour unions. When it became evident that the pending constitutional amendment to abolish child labour would fail of ratification in 1937, a Republican proposal was advanced for a new child labour amendment, avoiding the major objections registered against the old amendment. This received the unanimous support of the Senate judiciary committee. Republicans in Congress favoured

the repeal or modification of the surplus profits tax, urged the elimination of unnecessary government spending, and criticized some features of the Administration's plan for governmental reorganization, particularly the proposal to bring the semi-independent commissions under executive control and the proposal to abolish the office of comptroller general with its independent audit of executive spending. They opposed unitedly the President's proposal for enlarging the membership of the Supreme Court. On several issues, the Republicans co-operated closely with conservative Democrats.

In an effort to speed the rehabilitation of the party, Chairman Hamilton addressed many Republican meetings outside Washington and discussed organization and other problems with local leaders. Groups of Republican State chairmen, leaders of the Young Republicans, Republican chairmen of the larger cities, and the women members of the national committee, also conferred with Chairman Hamilton at Committee headquarters in Washington.

A proposal of former President Hoover to hold a mid-term Republican convention in 1938 caused much discussion. Meeting in Chicago in November, the Republican National Committee, sidetracking the proposal for a mid-term convention, authorized its executive committee to name a Committee on Program which should report back later its recommendations to the full National Committee. In December, the executive committee met in St. Louis, and set up such a committee with a membership of several hundred men and women. Dr. Glenn Frank, former president of the University of Wisconsin, was named chairman.

In the election of Bruce Barton, in the 17th New York district in November, the Republicans gained a House seat. In other special congressional elections, two more New York districts remained Republican, with a substantial increased percentage of the total vote. The Republicans also increased their strength in the New York State Assembly, and won control of the New Jersey State legislature. Republican mayors were re-elected in Cleveland, Akron and Canton, Ohio.

On September 18, Senator Arthur Vandenberg of Michigan urged a coalition of all parties to fight the "Roosevelt-Farley-LaFollette" party. During the latter part of the year, former President Hoover made several important speeches. On December 10, in Washington for the Gridiron dinner, former Governor Alfred M. Landon issued a statement definitely removing himself as a possible Republican candidate in 1940. (See also ELECTIONS.)

**Retail Sales.** The sales for all types of American retail stores in 1937 are estimated by the United States Department of Commerce, to have been \$40,388,000,000, an increase of approximately 6½% over the total retail sales for the year 1936. The largest sales increases in dollar volume were shown by the three major mail-order companies, which had an average gain of about 15% for 1937 and this gain was equalled also by the shoe chains. Four of the leading grocery chains showed an increase of 9% for 1937, with the drug chains next with an average of 7.5%. The variety chains had an average gain of 4.7%.

Although the gains of the variety chains seem small when expressed in terms of per cent, their sales declined from 1929 to 1933 only 25%, as compared with a general retail decline, for the same period, of 49% in dollar volume. Consumers' co-

operative stores showed a gain of 20% in 1937 over 1936, although their total sales in dollar volume probably did not exceed \$500,000,000, or about 14% of the total 1937 volume of \$40,388,000,000.

The department, dry goods, and general merchandise stores showed a gain of 6% in sales in 1937 over 1936. Since a little better quality of merchandise was sold in 1937 than in 1936, it is probable that the total number of transactions, represented by unit sales to the consuming public, was little if any more in 1937 than it was in 1936.

The outstanding problem which confronted retailers in 1937 was the employee-relations problem. Trade unions made important gains in the retail field in 1937, and through collective bargaining obtained substantial wage increases or shortened hours for various groups of retail employees. Department store and specialty store managements granted substantial increases to their employees in other localities where they were not approached by the unions.

At the beginning of 1937, retail sales plans were predicated upon obtaining an increase of at least 10%, which most of the better-managed stores realized during the first half of the year. During the following six months, however, sales increases became progressively less. As a consequence, the average gain in sales of 6% in 1937 over 1936 has been insufficient to absorb the increase in payroll and in additional taxes, and therefore department store and specialty store profits for the year 1937 will be less than those shown for the year 1936. Department store operating expenses, moreover, increased in 1937, approximating 35% of retail sales, or an increase of about 10% of the 1936 expense rate. It is estimated that the net profit on total sales of department and specialty stores for the year 1937 will not exceed, if they reach 3½%, whereas in 1936 their average net profit on sales was 4.9% based on the figures released by the National Retail Dry Goods Association.

The decline in the sales volume during the last half of 1937 is attributed to the fact that commodity prices rose too quickly at the early part of 1937, and when the business recession began in the summer of 1937, consumers curtailed their buying power, leaving many retail stores with relatively high inventories. In turn, retailers were forced to make price cuts in order to liquidate their inventories during the latter half of 1937, and the resultant increase in markdowns during the latter part of the year will also have its influence in reducing retailers' profits for the year 1937. The application of legal price maintenance operated to some extent to increase prices of nationally advertised commodities, notably in cosmetics, drugs, and books. Price-maintained arrangements were made possible by passage of the Tydings-

Miller Act, making it legal for manufacturers to establish the retail price of their products in the 42 States where Fair-Trade Laws were already in effect. (P. J. R.)

**Great Britain.**—Retail sales of food in Great Britain continued to expand during 1937, when the Bank of England index number of food sales (1933=100) reached a figure of 131, as compared with 120 in 1936 and 111 in 1935. But to an increasing extent this expansion was being accounted for by rising food prices; so that the increase in volume was narrowing, as is shown by the following table, in which comparison is made with the Ministry of Labour Cost of Living Index (food only):

(Food)	Money sales Per cent	Retail prices Per cent
1936. . . . .	+9	+4
1937. . . . .	+9	+7

In the case of other merchandise, the expansion of retail sales continued to be somewhat smaller than for foodstuffs, the corresponding index number being 119 for 1937, 113 for 1936, and 108 for 1935.

A distinction must here be drawn between sales of clothing and of household equipment (furnishings, hardware, etc.). During the period of economic recovery, from 1932 to 1936, sales of household goods expanded appreciably faster than clothing, retail prices in each case being fairly stationary. In 1937, however, this position was reversed, and the increase in clothing sales began to outstrip that of household equipment. At the same time, retail prices of non-food articles began to rise appreciably for the first time since 1930; and this rise affected household goods considerably more than clothing.

In the following table, comparisons are made between 1937 increases in money sales and retail prices, the latter being approximate estimates only:

(1937)	Money sales Per cent	Retail prices Per cent
Clothing:		
Women's wear . . . .	+6.1	+ 2.8
Men's & boys' wear . .	+5.9	+ 3.2
Boots & shoes . . . .	+8.4	+ 5.9
Dress piece goods . . .	+1.8	+ 2.7
House equipment:		
Furnishings . . . . .	+3.1	+10.0
Hardware . . . . .	+1.6	+ 8.6
Piece-goods . . . . .	+2.8	+12.2

Thus the volume of clothing sales continued to expand, whereas sales of household goods declined appreciably.

In the autumn of 1937, a recession developed in the sections of retail trade catering for consumers with higher incomes, but not correspondingly among those supplying work-class consumers; as a consequence, retail sales in Central and West End London (relatively high-class) rose during 1937 by only 2%, as compared with over 7% for Great Britain as a whole. The cause of this recession is thought to be closely linked to the decline in stock exchange values which occurred at the same time. (D. BA.)

**Réunion**, an island c. 420mi. east of Madagascar, is a French colony. Area 970 sq.mi.; population 209,000. The capital is St. Denis. Réunion exported, in 1937, 70,000 tons of sugar to the value of over frs. 90,000,000 and over 34,000 hectolitres of rum. Total exports, January to Oct. 1, 1937, were valued at frs. 116,000,000. A health resort has been opened at Cilaos (3,250ft.).

**Rexists:** see BELGIUM: *History*.

DEPARTMENT STORE SALES in the United States: Federal Reserve Board index, without adjustment for seasonal variation

**Rheumatism:** see ARTHRITIS.

**Rhode Island,** one of the original States of the United States, popularly known as "Little Rhody"; area, 1,548 sq.mi. (smallest of the United States); population according to the U.S. census of 1930 was 687,497 and 680,712 in the 1936 State census. Of the latter figure, 525,232 were native white, 144,952 were foreign-born white, and 10,528 were negroes and others. The urban population (U.S. census, 1930) was 635,429, or 92.4%.

**History.**—At the special session of the legislature held Dec. 1936, new acts provided that county sheriffs and clerks of courts shall be appointed by the governor, the latter with consent of the Senate. At the regular 1937 session the gasoline tax was increased from two to three cents per gallon. A special commission was created to study and report on the tax structure of the State. Acts provided strict regulation of child marriages, created a commission to study juvenile court procedure, ordered children between ages of seven and sixteen years to attend school regularly, and regulated traffic in alcoholic beverages. New motor vehicles must be equipped with safety glass. The maximum rate of interest upon small loans shall be 3% per month. An act set up a bridge commission for construction of a bridge from Saunderstown to Conanicut island across lower Narragansett bay. The most important political event of 1937 was the contest between Governor Quinn and Walter O'Hara, manager of the Narragansett race track. The climax was reached in the governor's proclamation of martial law effective in the vicinity of the race track and his order closing the track for the latter part of the racing season. The chief officers of the State were: Robert E. Quinn, governor; Raymond E. Jordan, lieutenant-governor; Louis W. Cappelli, secretary of State; John P. Hartigan, attorney-general; Henri A. Roberge, general treasurer; and Edmund W. Flynn, chief justice.

**Education.**—During 1936-37 there were in the public elementary schools 75,770 pupils and 2,407 teachers, and 45,291 pupils and 1,853 teachers in high schools.

**Banking and Finance.**—In the State there were 68 banking institutions. Resources of banks under State supervision totalled \$443,645,985.66 and of banks under Federal supervision, \$110,335,110.62. Savings deposits in savings banks and trust companies amounted to \$317,172,200.16 representing 397,225 depositors, June 30, 1937. In addition, building and loan associations, loan and investment companies, and credit unions had \$44,967,367.21 invested in them.

**Agriculture.**—In 1935 the farm population was 21,751 in contrast with 16,477 in 1930. All land in farms, 307,725 acres; value, \$35,237,660. Crop production estimate by acres and quantity, Oct. 1, 1937, by Dr. J. L. Tennant, agricultural economist, Rhode Island State college indicated: tame hay, 42,000ac., 56,000 tons; potatoes, 4,300ac., 752,000bu.; corn, 9,000ac., 378,000bu.; oats, 5,000ac., 60,000bu.; apples, 380,000bu.; pears, 10,000bu.; and peaches, 27,000 bushels.

ROBERT E. QUINN, governor of Rhode Island

**Industry and Business.**—The United States census of business for 1935 shows that there were in the State 165,024 employees receiving a payroll of \$181,309,000. Of these, manufacturers employed 112,518 with a payroll of \$120,070,000. Retail business employed 28,881 with a payroll of \$27,671,000. Wholesale employed 6,328; insurance, real estate and finance, 4,976; service, 3,210; hotels, 1,288; mines and quarries, 175; construction, 2,299; miscellaneous, 5,350. The number of manufacturing establishments was 1,429. (M. C. M.)

**Rhodesia, Northern,** a British protectorate lying between lat. 8° 15' and 18° 5' S. and long. 22° and 33° 35' E., the Zambezi forming the southern boundary. Governor, Major Sir H. W. Young. Area, 288,400 sq.mi.; pop. (1931), 1,386,081, of whom 13,846 were Europeans. Capital, Lusaka (transferred from Livingstone in 1935); Ndola is the centre of the "copper belt." A Native Authority Ordinance, extending the principles of "indirect rule," was issued in 1936.

The year 1937 was one of marked economic recovery. In May a commission was appointed by the British Government to enquire into the financial position of the territory. It was announced that a portion of the budget surplus would be devoted to the construction and maintenance of a road from Lusaka to the Otto Beit bridge now being built over the Zambezi at Chirundu, which when opened will bring the capitals of the two Rhodesias within a day's journey of each other by car. The development of the new capital, Lusaka, made considerable progress, and its importance as an airport is steadily increasing. In November it was announced that the petrol and entertainment duties were to be abolished, and a boarding school established at Lusaka.

**Trade and Communications.**—Copper is the largest export, its value in 1936 being £4,994,716. Cobalt, vanadium, and gold were also exported. There was a drop in imports owing to cessation of imports of machinery and materials for developing mines. Total imports (1936), £2,291,953; exports, £6,045,137. The railway from Southern Rhodesia to the Belgian Congo passes through the centre of Northern Rhodesia, and branch lines serve the Roan Antelope, Nkana, and Muflira copper mines. There are three main roads. Roads are generally passable during nine months, but December to April traffic is restricted to 7,000 pounds. There are six Government telephone exchanges, and private exchanges at three of the mines. Imperial Airways Service operates, and also the French Air Service between Madagascar, Broken Hill, and Elizabethville.

**Banking and Finance.**—Southern Rhodesian notes and coinage are legal tender. Revenue (1936), £863,255; expenditure, £887,417. There is a native poll-tax, and an income tax (value in 1936, £211,721). Mineral rights belong to the British South Africa Company, which still draws mining royalties. (W. M. M.)

**Rhodesia, Southern,** a self-governing British colony, extending from the Zambezi in lat. 15° 6' S. to the Limpopo in lat. 22° 14' S., and from the Bechuanaland protectorate in long. 25° 14' E. to Mozambique in long. 33° 4' E. Area, c. 150,344 square miles. Pop. (1931) 1,109,012, of whom 49,910 were Europeans. Governor, Sir Herbert Stanley, G.C.M.G.; prime minister, Dr. G. M. Huggins. Great Britain retains certain powers over native legislation. The chief towns are Bulawayo (11,879), the capital Salisbury (9,619), Umtali (2,090), and Gwelo (1,266). State education is provided for Europeans; boarding schools play a large part. Matriculation for the University of South Africa is taken. Native education is provided by missions. The Jeanes school for native teachers is at Dombashawa.

**History.**—In Oct. 1937 the functions of the high commissioner were transferred to the secretary of state, and a board of trustees

appointed to govern the native reserves. A new Income Tax Act provides for the taxation of incomes derived from outside the colony. In July a new "Union Party" was formed to work for the country's amalgamation with the Union of South Africa. Work on the Umgusa dam, near Bulawayo, was almost completed during the year; and the expenditure of £500,000 to construct a further 1,000mi. of strip roads was approved. The relations between the two Rhodesias and Nyasaland continued throughout the year to be keenly discussed, and on Nov. 23 it was announced in the British parliament that a royal commission was to be appointed to visit the three countries, and report on the desirability of closer co-operation or association between them.

**Trade, Communications, Finance, etc.**—In 1936 there were 36,099mi. of telegraph and telephone. Railways representing five companies combined in organization as Bulawayo-Rhodesian Railways, Ltd., over 2,638mi. of track. Agricultural products are tobacco, maize, and citrus. There is great variety of minerals. Chrome production is increasingly important. Exports (1936, excluding est. value of gold premium, £2,236,000), £7,917,171; imports, £7,026,688.

British and South African silver coins are in circulation. Notes are issued by the two banks, the Standard Bank of South Africa and Barclay's. Revenue receipts for 1936-37 were £3,044,000, including customs £810,000, income tax £623,000, native tax £393,000, mining revenue £395,000; est. revenue for 1937-38, £3,103,500; est. expenditure, £3,149,587.

**Defence.**—All citizens are liable for a period of military training. The British South African police are the only permanent force, but there is provision for formation of a police reserve. The Territorial Active Force forms 2 battalions of the Rhodesia regiment. There is a subsidy for training a reserve of air pilots.

See Falker Windram, *Night over Africa*, 1937. (W. M. MA.)

**Rice.** The increase in rice growing in the U.S. resulted in 1937 in a record crop of 53,004,000bu., compared to 49,002,000 bu. in 1936, U.S. Department of Agriculture estimates. The yield in 1937 was 48.5bu. to the acre from 1,093,000ac.; in 1936, 50.6bu. to the acre from 969,000 acres. Three states, Louisiana, Texas and Arkansas, produced 42,854,000bu. of the 1937 crop; California, 10,150,000 bushels. Estimates of rice production in principal rice-growing countries in 1937 are given by the International Institute of Agriculture as follows, figures in parentheses being for 1936: Japan, 598,088,000bu. (612,313,000); Burma, 384,588,000bu. (351,951,000); Chosen, 239,502,000bu. (176,111,000); Taiwan, first crop, 40,112,000bu. (43,085,000); Italy, 38,409,000bu. (35,957,000); Annam, first semester, 14,712,000bu. (20,650,000); Bulgaria, 605,000bu. (1,015,000). Complete figures are not available for the crop year in India, which produced in 1935-36 a harvest of 2,111,632,000bu., compared to an annual average of 1,933,424,000bu. in the five years ending in 1934-35. The acreage under cultivation in India the current year, however, is 64,846,000 compared to 65,125,000 in 1936. In Egypt complete estimates for the crop year are not yet available, but the acreage is much smaller, 269,000ac. as compared to 489,000 in 1936. The Egyptian crop in 1936 was 33,943,000bu., compared to an annual average of 23,277,000bu. during the preceding five years. The acreage in Yugoslavia was the same for both 1937 and 1936, when 140,000bu. were produced. (See also CEREALS.)

(S. O. R.)

**Rio de Janeiro,** capital and largest city of Brazil, on the bay of Rio de Janeiro, or Guanabara. The area is 451 sq.mi., co-terminous with the Federal District. Population (official estimate, Dec. 31, 1936), 1,756,080. It is the

fifth largest city in America. Municipal organization is controlled by the national government, through an appointed prefect, or mayor. Little of note peculiar to the city itself occurred during 1937, but the strong centralizing trend of the national government promises to bring about a considerable augmentation of population. The wide avenues and the tropical flora, the botanical gardens, and the imposing buildings, against the setting of the beautiful harbour, make the city one of the world's most impressive capitals. It has external communication by steamship and air transport service, and internal by air, railway, sea, and highway. It is the seat of the National University of Brazil, created in June 1937, as the successor to the University of Rio de Janeiro. See BRAZIL.

**Rio Muni:** see SPANISH WEST AFRICA.

**Roads and Highways.** During the past 20 years, science has given us roads that are durable, weatherproof, dustless, and capable of carrying modern vehicles at speeds up to 100 miles per hour. Unfortunately, this achievement has been attended by a rising casualty list which shocks public opinion, and constitutes the main preoccupation of road experts. Public safety now dominates every other problem of the road. In Great Britain, road accidents occur at a rate exceeding 200,000 per annum; fatal accidents on British roads numbered 19 a day in the years 1930 and 1934, since when, fortunately, the figures have shown a slight downward tendency. It is stated that, in Germany, 8,381 persons were killed in road accidents during 1936, while the corresponding figure for France was 4,415. The toll of the road is rising in the United States of America, where it is predicted that road deaths may reach a total of 40,000 in 1938, as compared with 37,000 in 1935 and 38,500 in 1936. Some slight consolation may be found in the fact that, generally speaking, the curve of road accidents rises less steeply than that of motor-car sales.

In Great Britain, the most numerous victims are pedestrians and cyclists, who collectively account for about seven-tenths of the casualty list. A wide variety of expedients has been introduced, in the hope of stemming the tide of accidents, e.g., speed limits of 30m.p.h. on roads in built-up areas; refuges, crossings, subways or bridges for pedestrians, guard rails, white lines and cycle tracks, not to mention a multiplicity of warning signs, traffic lights, etc. A recent innovation in Great Britain was the appointment, by the minister of transport in 1937, of accident officers to examine "black spots," and stimulate local interest in safety problems.

The use of road frontages for purposes incompatible with the safety and convenience of traffic will, in future, be checked under the provisions of the Restriction of Ribbon Development Act, 1935, in England. Section 2 confers upon highway authorities the control of estate development and new buildings within 220ft. from the middle of the road. The provision of service roads can be secured, and extended powers are given for the creation of parking places, above and below ground.

The passing of the Trunk Roads Act, 1936, testifies to the growing recognition of the national importance of the British road system which hitherto has been maintained entirely by local highway authorities. Under the new act, the minister of transport became, in 1937, the highway authority for 4,500mi. of trunk roads in the United Kingdom, leaving about 174,000mi. under local control as in the past.

The following recommendations are extracted from the Memorandum on *The Lay-out and Construction of Roads*, issued by the ministry of Transport in 1937:

A GERMAN SAFETY HIGHWAY, with parkway separating traffic lanes, and two-level intersection

CONCRETE HIGHWAY being laid by motorized machinery that advances as it works

GRADE SEPARATION, the modern crossroads

CLOVER-LEAF INTERSECTIONS and underpasses safeguard and speed motorists on Chicago's Outer Drive

A CLOVER-LEAF JUNCTION on one of Germany's new State motor roads

"The unit width for each lane of vehicular traffic should normally be 10ft., and the width of the carriageway should not be less than 20ft. Where the traffic volume demands four lanes, the carriageway should be divided by central islands, or by a continuous central reserve, so as to segregate up and down traffic. Dual carriageways are justified on roads carrying 400 vehicles and upwards per hour. Shrubs planted on the central reserve will mitigate glare. Cycle tracks (6ft. wide), as well as footways, will be necessary along many busy highways. One thousand feet should normally be regarded as the minimum radius of curves, and the width of the carriageway should be increased where curves occur. Superelevation or banking should be applied, varying from 1 in 16 for curves of 500ft. radius to 1 in 40 for curves of 5,000ft. radius. A gradient of 1 in 30 is usually regarded as the maximum. In setting out vertical curves, the aim should be to enable drivers approaching a summit from opposite directions to see each other at a distance of at least 500ft."

**Traffic and Road Works.**—In spite of the dangers of the highway, there are no signs of any flagging in the popularity of motor transport. In Great Britain, every day sees 400 or 500 new automobiles come on to the road. The number of licences current in Feb. 1932 was 1,691,565, as compared with 2,378,717 in 1937—an increase of nearly 41% in five years. The traffic census taken on the 27,000 miles of Class I roads in Aug. 1935 recorded an increase of 34.47% in vehicles, in comparison with the year 1931. In Great Britain, the number of vehicles per mile of road is about 12 (omitting motor-cycles), in France about half that, and in the U.S.A. approximately eight. In the light of such figures, it is not surprising that the capacity of highway systems originally intended for horse-drawn traffic should be severely over-taxed, and that accidents should be rife. In many of the older countries, the governments accordingly are faced with the alternatives of drastically improving the existing roads or creating a new system of motorways adapted for modern traffic. In Great Britain hitherto, the policy usually favoured has been to improve the old highways and form by-passes round towns and villages. Upwards of 300 by-passes have already been formed, but the results have not won universal approval, and objectors are apt to point to the bolder methods pursued in Germany and Italy, where main roads are a national, not a local, responsibility. The German Government has embarked upon a program for the building of nearly 4,500 miles of motor-roads (Autobahnen), of which 1,240 miles were open to traffic in Dec. 1937. They are designed with dual carriageways, and traverse the country with the uncompromising directness characteristic of railway engineering. There are bridges or subways at all cross-roads, so as to eliminate the risk and delay associated with old-fashioned road junctions. In Italy, too, the building of motorways has been in progress for several years, and few roads are more familiar to tourists than the motorways radiating from Milan to the Italian lakes, from Rome to Ostia, and from Rome to Naples. The desire to attract foreign visitors has been largely instrumental in the building of mountain roads in France and Austria. During the summer of 1937, the Route des Alpes, passing over the Col de l'Iséran (9,000ft.), was opened for its entire length. At the same time the Austrian government completed the Grossglockner Hochalpen road (summit level 8,200ft.)—the project including a tunnel more than 900ft. in length.

In the United States of America, the building of new roads proceeds at the average rate of about 20,000 miles a year. During the year 1937 no fewer than 1,149 level crossings were abolished. Good progress is being made with the inter-American highway, which will extend 3,250 miles from Nuevo Laredo, on the border between Texas and Mexico, to Panama City. The gaps in the route have now been reduced to about 560 miles in the aggregate.

**Urban Congestion.**—The ever-growing congestion in populous centres, and especially in the great capital cities, is taxing the ingenuity of road-engineers and town-planners. A recent investigation in London showed that the average pace attained by an automobile, in making a 12½-mile journey across the heart of London, was roughly 12½ miles per hour. Traversing the city from east to west, the average was only 5.85 miles per hour, while on the slowest journey recorded, the pace dropped to 3.6 miles per hour. These figures compare with an average speed of 23.6 miles per hour on the North Circular road, which lies at a distance of seven miles from the centre. Site values are so high that street widenings in the heart of London may cost £2 millions or more a mile, while the value of the space occupied by a stationary motor-coach has been estimated at £40,000—an indication of the intense difficulty presented by the parking problem in such areas. The gravity of the situation is increased by the division of the responsibility for improvements among multitudinous authorities, and it was in the hope of securing a plan of comprehensive scope that the minister of transport, three years ago, ordered a highway development survey of Greater London to be prepared by Sir Charles Bressey, in consultation with Sir Edwin Lutyens. The plans were ready at the end of 1937. Meanwhile, important works in progress include the construction of a Lower Thames tunnel at Dartford, and the extension of the Cromwell road to form a new western exit from London. Londoners have much to learn from what has been done in New York, e.g. the elevated highway running the whole length of the west side of Manhattan from the Harlem river to the Varick street entrance to the Holland tunnel—a distance of 12 miles. At the Harlem river, a junction is made with the Henry Hudson parkway which, in its turn, connects with the Hutchinson river parkway of the Westchester system. Mention should also be made of the Long Island parkway system, and of the Pulaski Skyway which, avoiding the local traffic system, connects the Jersey portal of the Holland tunnel with Newark airport. On Dec. 22, 1937, the south tube of the "Lincoln" vehicular tunnel under the Hudson river was first opened to traffic.

Paris has devoted much attention to the building of vehicular subways, enabling traffic along the principal radial roads to pass under the ring road known as the Boulevard Militaire which follows the course of the dismantled fortifications. In Berlin, a scheme is under way for the extension of the well-known Unter den Linden, where, incidentally, the old lime trees have recently been replaced by new. This extension will involve the drastic widening of the Charlottenburger Chaussee through the Tiergarten. As part of the re-shaping of Rome, the new Via del' Impero claims attention by its imposing width, and the manner in which it brings to view some of the principal features of the ancient capital of the world. Stockholm displays an extremely ingenious application of the cloverleaf device as a means of solving traffic difficulties at Slussen—the most congested intersection in the city. The progress of road engineering will be reviewed at the International Roads Congress to be held at The Hague in June 1938. See also CHICAGO; GASOLINE.

(C. H. BR.)

**Robinson, Henry Mauris** (1868–1937), California banker, was frequently consulted by U.S. presidents and refused cabinet positions under Presidents Wilson, Harding and Hoover. Born in Ravenna, Ohio, Sept. 12, 1868, he practised law in Youngstown until he moved to New York in 1900. Active in the financial and business world from that time, he shifted his headquarters to California in 1906. His public services included work on the U.S. Council of Defense, the Supreme Economic Council of the Paris Conference, and the U.S. Shipping Board. He was a member of the Reparation Com-

mission in 1924, chairman of the American delegation to the International Economic Conference of 1927, and a prominent adviser of President Hoover during the financial crisis of 1929-31. In addition to his wide business connections, he served as chairman of the board of the Huntington library and art gallery and as a trustee of the California Institute of Technology. He died in Pasadena, Cal., Nov. 3, 1937.

**Robinson, Joseph Taylor** (1872-1937), American Senator and leader of the Democratic majority since 1931, died suddenly on July 14, 1937, at Washington, D.C., in the midst of a struggle over President Roosevelt's court plan. A loyal party man from his entrance into politics at the age of twenty, he served as member of the House of Representatives (1902-1913), as Governor of Arkansas (1913), and as U.S. Senator (1913-1937). A leading candidate for the Supreme Court at the time of his death, he was born at Lonoke, Ark., Aug. 29, 1872 and practised law before entering upon his political career.

**Robinson-Patman Act:** see CHAIN STORES; MARKETING.

**Rockefeller, John Davison** (1839-1937), American capitalist who at the height of his business career was the richest man in the world, was a pioneer in oil exploitation, business organization, and finance—amassing a fortune supposed to be in the neighbourhood of \$1,000,000,000. His contributions for educational, medical, and religious purposes alone amounted to \$530,853,632. Born in Richmond, N.Y., July 8, 1839, he went to high school and business school before starting business as a clerk. In 1862 he invested in an oil refinery, which he ultimately built into the great Standard Oil Company. Upon his retirement from business, Rockefeller turned his fortune over to his son for administration. The unpopularity of his business methods was, in view of the size and usefulness of his benefactions, gradually diminished, and at the time of his death he was remembered more for his philanthropies than for his business tactics. Foremost of the "rugged individualists" who flourished in the United States in the 19th century, he died in his sleep at Ormond Beach, Fla., May 23, 1937. Articles on his life and benefactions may be found in the *Encyclopædia Britannica*, vol. 19, pp. 364, 365.

**Rockefeller Center**, including Radio City, covers nearly three blocks, 48th to 51st st., between 4th and 6th avenues, New York, an area of approximately 12 acres. Early in the 19th century, Dr. David Hosack acquired 20 acres of common land, including this area, where he established a botanic garden which the State legislature in 1814 granted to Columbia college. With a view to erecting a new opera house, John D. Rockefeller executed a long lease on the property, and when the scheme fell through, he substituted the largest building enterprise ever undertaken by private capital. Eleven of the 14 projected buildings have been completed. Radio City, the headquarters of the Radio Corporation of America, embraces the N.Y.C.A. building, 850 feet in height and in gross area the most spacious office building in the world. Also, there are the elaborately equipped and decorated Radio City Music Hall seating 6,200 persons and the Center Theatre, seating 3,700, and containing the world's largest chandelier, 25 feet in diameter with 400 lights and weighing 6 tons. Fronting Fifth avenue are the International building and buildings named after Great Britain, France and Italy. The approaches to these vast structures are beautified by sculpture and fountains. The interiors are adorned by murals which express modern tendencies in art. There is accommodation

for stores and exhibitions, also lavishly appointed restaurants and cafés, and every up-to-date convenience. About 20,000 persons earn their livelihood in the buildings which are visited daily by a further 80,000 persons, many of whom, visiting New York, regard Rockefeller Center as a showplace, and one of the wonders of the world, which undoubtedly it is.

**Rockefeller Foundation** was chartered in 1913 for the permanent purpose of "promoting the well-being of mankind throughout the world." Its present program is concerned with certain definite problems in medical, natural, and social sciences, the humanities, and public health. In the field of medicine its interest is centred in nervous and mental diseases, and its contributions are chiefly for the furtherance of research and teaching in psychiatry and allied subjects. Its program in the natural sciences is concerned with experimental biology. In the social sciences it has three spheres of special interest: international relations, social security, and public administration. The program in the humanities centres around the techniques by which cultural levels of contemporary society are being influenced—such as museums, the radio, drama, and libraries—and the promotion of better international understanding through cultural interchanges. The program in public health includes research on a number of selected diseases; demonstrations in the control of some of these diseases in their environments; co-operation with Governments in services of central or local health departments; and the development of public health education. During 1937 the foundation appropriated approximately \$9,850,000 for work in its various fields of interest. The chairman of the board of trustees is John D. Rockefeller, Jr.; the president, Raymond B. Fosdick; and the secretary, Norma S. Thompson.

**General Education Board** was incorporated by an act of Congress in 1903, with the stated object of "promoting education within the United States of America without distinction of race, sex, or creed." Its present program is restricted in the main to giving assistance to research and experimentation for the improvement of general education, with special reference to education, both white and negro, in the Southern States. During 1937, the board appropriated approximately \$5,000,000 for purposes within its present program and to bring to a close certain other undertakings under previous programs. The chairman of the board of trustees is John D. Rockefeller, Jr.; the president, Raymond B. Fosdick; and the secretary, William W. Brierley.

**The Spelman Fund of New York**, during 1937, continued its program directed at the improvement of the methods and techniques in the field of public administration. Support was extended to public and quasi-public agencies engaged in circulating information regarding advances in administrative practice, in developing new types of organization and operating methods, and in actually installing administrative improvements in governmental agencies.

**Roebbling Medal Award:** see MINERALOGY.

**Roman Catholic Church.** Claiming to be the one, only church established by Jesus Christ, the Catholic Church professes to possess the four "marks," or characteristics whereby the church of Christ may be recognized by men. These characteristics require that the church be: one in doctrine, worship and government; holy in its teaching and its members; catholic in the sense of being universal; and apostolic in the succession of its hierarchy. In order to perpetuate in all their integrity the truths and means of salvation taught by Christ, it is necessary that there exist a visible, or human organization

under the supreme authority of the bishop of Rome, the successor to St. Peter whom Christ designated as His vicar on earth.

The unity, holiness and apostolicity of the Catholic Church have been spread universally through the world. There are at present a total in excess of 375,000,000 Catholics. These include members of the Latin, Greek and other Oriental rites in communion with, and under the jurisdiction of, the pope or bishop of Rome. The number of Greek or Oriental Roman Catholics is approximately 7,758,300. The Catholic population on the European continent is estimated at 210,000,000. That of England and Wales is about 2,400,000, of Scotland about 600,000; of all Ireland about 3,000,000. In the two Americas, the Catholic Church includes a membership of 136,000,000. Of these, there are in the United States, including Alaska and Hawaii, 20,959,134; in the Dominion of Canada, 4,415,000.

**New Cardinals.**—This vast body of the Faithful is united under the spiritual headship of the Roman pontiff (*see* Pius XI) who exercises temporal sovereignty over Vatican City State. The College of Cardinals, titular pastors of churches in Rome, was brought up to one less than the traditional and canonical number of 70, when, on Dec. 13, at the Secret Consistory, Pope Pius created five cardinals; Arthur Hinsley, archbishop of Westminster, England; Pierre Gerlier, archbishop of Lyons, France; Giuseppe Pizzardo, secretary for Extraordinary Ecclesiastical Affairs; Ermenegilde Pellegrinetti, apostolic nuncio to Yugoslavia; Adeodato Giovanni Piazza, patriarch of Venice, Italy. The composition of the Sacred College is (Jan. 1, 1938) 39 Italian and 30 non-Italian members. Death came to two members during 1937: Cardinal Ilundain y Esteban, archbishop of Seville, Spain, and Cardinal Bisleti, prefect of the Sacred Congregation of Seminaries. An exceptionally large number of consecrations of new bishops and of translations to different sees was made in 1937. In the United States, three dioceses were raised to archdioceses: Detroit, Mich., Newark, N.J., and Louisville, Ky., and four new dioceses were erected: Lansing, Mich., Camden and Paterson, N.J., and Owensboro, Ky. For the first time in many years, every American see was filled.

In the work of the 11 congregations which carry on the executive functions at the Vatican particular interest attaches to the function of the Holy Office which deals with matters of faith and morals. This congregation listed six volumes on the index of forbidden books: *Etudes sur Descartes*, by L. Laberthoniere; *Klosterleben*, by Burchard Assmus; *Die Natuerliche-Geistlehere*, by Ernest Bergmann; and *Ragione et Fede, Gesu Christo et Christianesimo*, and *Il Vangelo con Introduzione* by Pietro Martinetti. Peculiar curiosity attaches, also, to the decisions of the Sacred Rota, the second of the three tribunals, or judicial courts. Decisions were rendered on 78 marriage cases; decrees of nullity were awarded in 34 cases; it is worthy of note that, in 21 of these annulments, the petitioners were so poor that they were unable to pay even the ordinary expenses of the judicial processes. There were no canonizations during the year. Pope Pius, during his pontificate of 15 years, has celebrated the extraordinary number of 24 canonizations and 39 beatifications.

In the diplomatic sphere, a *modus vivendi*, after a lapse in relations for 63 years, was signed by the Holy See and Ecuador on Aug. 9, 1937. The *modus vivendi* with Czechoslovakia, executed in 1928, began to be put into effect. The pope sent his special representative, Archbishop (now Cardinal) Pizzardo, to the coronation on May 12 of King George VI. Semi-official relations were entered into with the Nationalist Government in Spain by the exchange of Chargés d'Affaires.

The Concordat with Italy continued to be observed by both parties, and cordial relations existed. Acting as papal legate, Cardinal Dougherty, of Philadelphia, Pa., was formally received

by the Chinese authorities and the Japanese emperor.

**Japan and Spain.**—The anxiety of the church was centred on the conflicting nations. A newspaper report, internationally publicized, to the effect that the Vatican had issued instructions to the Chinese missionaries to aid Japan in the undeclared war in China, was emphatically denied. The structure of the church and the public practice of religion continued to be obstructed in Loyalist Spain, and the number of priests, religious and lay Catholics alleged to have been executed in Loyalist territory rose above 14,000. On July 1, the Spanish hierarchy sent a joint letter to the bishops of the world protesting against the Loyalist government. While there was a relaxation of active persecution of the Catholic Church in Mexico, the anti-religious decrees were neither repealed nor amended. During the year, however, a very vigorous forward movement of pacific Catholic action through education was solidified. In Soviet Russia, the Catholic Church remained in a state of collapse under the continued assaults of the atheistic régime. On several occasions, Pope Pius declared that the great heresy of this age was that of the materialistic and atheistic ideology of Communism.

**Germany.**—In Nazi Germany, where Catholics constitute about 33% of the population, the conflict with the church was intensified. On February 14, Cardinal Faulhaber, of Munich, accused the Nazis of having violated the Concordat with the Vatican, ratified Sept. 10, 1933. The papal encyclical of March 14, reinforced his charges in most vigorous terms. During the same month, the Nazi government refused to discuss the religious question with the Papal Nuncio, and on May 1, Chancellor Hitler warned that all churches opposing the totalitarian philosophy would be suppressed. By open and subtle means, the freedom of the church was circumscribed, the repute of Catholic leaders was scandalously assailed, Catholic youth organizations were disbanded and Catholic education forbidden. On almost every occasion when he spoke in public, but most especially at his address to the cardinals on Dec. 24, Pope Pius lamented the German persecution and assailed the Nazi leaders.

**Eucharistic Congress.**—The 33rd International Eucharistic Congress was opened on February 3 at Manila, Philippine Islands by Cardinal Dougherty, the papal legate, and was concluded on February 7 with a message broadcast from the Vatican by the pope. National Eucharistic Congresses were held throughout the world, notably that of July 11, at Lisieux, France, which was attended by about 300,000 pilgrims. Among the other memorable gatherings were those of the International Congress of Catholic Nurses, London, July 26; the congress of the Jeunesse Ouvrière Chrétienne, Paris, August 2; the pilgrimage to Aix-la-Chapelle, Germany.

**Missions.**—Missionary activities of the Catholic Church are carried on among the natives of every continent. India celebrated in December the 50th anniversary of the establishment of the hierarchy. During that period, the Catholic population increased from 1,660,000 to 4,000,000. China counts about 3,000,000 Catholics, among whom 1,750 priests labour; they and the religious congregations of women are conducting 415 orphanages, 236 hospitals and homes, and 1,002 clinics. The tendency in the Catholic Church is that of creating a native clergy and religious sisterhood. In Ceylon there are 800 sisters and three religious brotherhoods, entirely Singhalese. The newly formed Prefecture of Zenshu, Korea, is administered entirely by Koreans. Kimberly witnessed the ordination of the first coloured priest in South Africa. The flow of missionaries from Europe, and during the past decade more than ever, from the United States together with the great amount of money contributed for the propagation of the faith in foreign lands has brought an adequate return in conversions.

(F. X. T.)

**Romansch.** According to a decree of the Swiss federal council on July 8, 1937, Romansch, an offshoot of Latin, has become the fourth national language of Switzerland. This decision affects some 50,000 inhabitants of the Engadine, the Oberhalbstein, and the Grisons Oberland. It does not, however, change the Swiss constitution, which provides for three official languages (French, German, and Italian) in parliamentary and legal matters.

**Rome,** the capital (since 1870) and largest city (pop., 1936, 1,150,000) of Italy, including within its ambit the independent State of the Vatican city, is situated on the river Tiber, 17mi. from its mouth. The city is to be in 1941 the scene of an International Exhibition, to be held at Tre Fontane, near the church of San Paolo fuori le mura, on a site covering about 1,000ac., and early in 1938 it was announced that the town-planning scheme initiated in 1931 for the extension and modernization of the city, is to be implemented and modified so that the city will have largely changed its appearance before the date of the exhibition. An elaborate scheme of underground railways has been prepared, and exploratory shafts have been sunk: the lines proposed run from the central Termini station to the "Lido," for exhibition grounds, passing under the Palazza Venezia; to the Porta Pia and Piazza Verbano; to St. Peter's and the Viale Angelico; with suburban (partly surface) extensions to Frascati, Albano, Velletri, etc. The railways to the Alban hills, Rome's playground, are to be electrified and the Termini station is to be rebuilt 200ft. behind its present frontage line. The exhibition buildings so far as possible are to be of a permanent character, so that later they may be retained as part of the scheme of development for the country between Rome and Ostia, which is to be occupied by parks and garden villages. A new airport has been projected near the Magliana station; and two new motor roads are under construction connecting the centre of the city and the Trastevere with the exhibition grounds.

Other developments which made progress during 1937 include the restoration of the mausoleum of Augustus; the construction of the new Corso del Rinascimento which will improve communications between the Piazza Venezia and the Capitol and Prati; the construction of new shops and restaurants in the Trastevere district; and, with the concurrence of the Vatican authorities, the opening-up of the approaches to St. Peter's and the clearance of the Piazza di San Pietro.

**Roosevelt, Franklin Delano** (1882— ). On Jan. 20, Franklin D. Roosevelt took the oath of office for his second term as President of the United States. With the exception of the period from Aug. 21 to Nov. 15, Congress was in session virtually the entire calendar year. Legislative problems necessarily, therefore, required much of the President's time and attention.

With large Democratic majorities in both houses, the Seventy-Fifth Congress convened on Jan. 5. In his annual message on the state of the Union, the President on Jan. 6 reviewed the social and economic progress achieved by the American people during his first administration, dedicated himself again to the aims of the New Deal, and challenged the courts to join the march for social progress, or risk a curb on their powers. In his budget message two days later, he held out the hope of a "layman's balance" in 1938, with a complete balance of the budget and a resumption of public debt reductions in 1939. On Jan. 11, he asked Congress for a \$790,000,000 appropriation to finance Federal relief operations during the last five months of the fiscal year, and on Jan. 12, he laid before Congress his program for administrative reorganization.

THE PRESIDENT OF THE UNITED STATES broadcasting to the nation his "Fireside Chat"

Other legislative proposals of major importance soon followed. On Feb. 5, the President asked Congress for reforms in the Federal judiciary, and the authority to enlarge to 15 the membership of the Supreme Court. On Feb. 16, he submitted his farm tenancy message. On April 20 he requested a \$1,500,000,000 relief appropriation and on May 27, he urged Congress to "extend the frontiers of social progress" by enacting legislation banning child labour, and fixing minimum wages and maximum hours in industry. In May with a special message, he launched his drive against tax evaders. On June 3, he sent his regional planning message to Congress, in which he asked for the establishment of seven regional power agencies, and on June 8, in a special message, he proposed direct subsidies as part of a new plan for rehabilitating the American merchant marine. Though the President faced increasing opposition in Congress to his court reform and several other bills, he continued to press hard for their enactment until the first session of Congress adjourned *sine die* on Aug. 21.

The labour situation and the wave of sit-down and other strikes also engaged the President's attention during much of the year. On June 15, he said that concerns agreeing verbally to workers' collective bargaining contracts should sign such contracts. On June 17, he appointed a special board, headed by Mr. Charles P. Taft of Cincinnati to speed up the steel strike agreements, and on June 18, he dispatched Assistant Secretary of Labor Ed McGrady to Cleveland to do what he could to effect a mediation in the steel strike, and shortly afterwards asked steel mills to remain closed during the period of mediation. On July 11, he outlawed strikes among Government employees, and limited their powers of collective bargaining. On July 27, he defended the Federal Labor Relations Board against charges of bias, and two days later conferred with Governor Frank Murphy of Michigan on the strike and labour situation in that State. On Nov. 19, he ordered the Federal Trade Commission to investigate charges that the rise in living costs was due to monopolies, illegally operating.

During the first session of the Seventy-Fifth Congress, the President left Washington twice on holiday trips. In March, he spent two weeks in the South, and in May he went fishing off the coast of Texas. As his legislative program, including the court reform bill, was stalled on Capitol Hill, the President accepted an invitation to attend a "harmony" party of congressional Democrats at Jefferson Island. Lasting two days, it began June 25.

Following the recommittal of his Supreme Court bill, the President on Aug. 12, submitted to the Senate the nomination of Senator Hugo Black to fill the place on the Supreme Court made vacant by the retirement from active service of Mr. Justice Van Devanter. After the adjournment of Congress in late August, the President left Washington on Aug. 26, for his home in Hyde Park. He returned to the capital for his Constitution Day speech on Sept. 17, in which he hinted at a renewal of his drive to "reform" the Supreme Court.

On Sept. 22, he left Hyde Park for a 6,500-mile trip to the Pacific coast and back. On Sept. 30, he made a "good neighbour" visit to Victoria, British Columbia. The President made several important speeches on his western trip. Speaking at Bonneville dam in Oregon, on Sept. 28, he promised a balanced budget in 1938. At Chicago, on Oct. 5, he made his historic declaration in favour of a quarantine against aggressor nations. The ovations he received throughout the western trip seemed to indicate that his popular prestige, despite the reverses suffered in Congress, was substantially as great as it was a year before. This is believed to have been an important factor in his decision to call Congress in special session on Nov. 15.

In a radio speech on Oct. 11, the President sought popular support for the program of the special session, the call for which was issued the next day. The program included wages and hours, agricultural control, Federal reorganization, and regional planning. On Oct. 18, in a revised budget statement, the President indicated a deficit for the year of \$695,000,000. He ordered a liquidation of PWA and RFC, and laid upon Congress the main responsibility for the deficit. On Oct. 21, he appointed his eldest son, James, a White House secretary, as co-ordinator of eighteen independent federal agencies. On Oct. 23, he warned Congress that the additional costs of the new farm bill must be covered by new taxes. Prior to the opening of the special session, the President spent about two weeks at Hyde Park. During his occupation as a "farmer," he voted at Hyde Park on Nov. 2, and two days later conferred in New York city with Fiorello La Guardia, re-elected mayor.

An economic recession, setting in in the autumn months, diverted Congressional and public attention from the Administration's legislative program for the special session, to the business and economic problems facing the nation. On Nov. 18, an abscessed tooth was extracted. A few days later he left Washington for a fishing trip in Florida waters, but cut his fishing cruise short to return to Washington for treatment of his sore gums. As a means of speeding up industrial production, the President in a message on Nov. 29, urged revision of the Federal Housing Act, and a private housing drive for from \$12,000,000,000 to \$16,000,000,000 of new construction in the next two years.

On Nov. 30, the President in a message, asked Congress for a \$100,000,000 a year reduction in Federal aid for the construction of highways. He attended the semi-annual Gridiron Dinner on Dec. 11. On Dec. 17, at a press conference, he indicated his strong opposition to the war referendum plan. In a letter to Chairman Taylor of the House Appropriations Committee, the President, on Dec. 27, indicated his intention of asking for a supplemental naval construction. Previously, on Dec. 21, the special session had adjourned, without taking final action on any of the President's legislative recommendations. (O. McK.)

**Root, Elihu** (1845-1937), American lawyer and statesman who rendered distinguished service as Secretary of War in President McKinley's Cabinet and as Secretary of State in President Theodore Roosevelt's Cabinet. The crowning event of his career was the protocol, formulated in 1929, whereby the United States was able to join the Permanent Court of

International Justice; this protocol was adopted by the special committee of international jurists and by the Council of the League of Nations. In recognition of his efforts to smooth the path for the United States to join the World Court, he was awarded the American Bar Association medal in 1930. The previous year he had received the gold medal of the National Academy of Design for having drawn the bill creating a National Fine Arts Commission and for reviving L'Enfant's plan for the beautification of Washington. His death occurred in New York city, Feb. 7, 1937. The reader will find an account of his career in the *Encyclopædia Britannica*, vol. 19, p. 542.

**Roque:** see CROQUET AND ROQUE.

**Rose, Sir (Hugh) Arthur** (1875-1937), Bt., D. S. O. LL.D., British social economist. He was educated at Harrow and Trinity college, Cambridge. He was for many years active as an educationist in Scotland, being, from 1920 to 1924, chairman of the advisory council to the Scottish education department, but his interests were wide and various. He was food commissioner for Scotland, 1919-20; director of land settlements, Scotland, 1920-22; and chairman of the general board of control for Scotland, 1922-36. From 1934 to 1936 he was commissioner for Scotland under the Special Areas Act. He was knighted in 1919 and created a baronet in 1935. He won the D.S.O. in 1917 while in command of the 15th battalion of the Royal Scots. He died in Edinburgh, Aug. 14, 1937.

**Rosenwald Fund, The Julius.** The Rosenwald Fund differs from other large American foundations in that the trustees are not only permitted to spend capital as well as income at any time but are compelled to expend all its funds within twenty-five years of the death of its founder, that is, before Jan. 6, 1957. During the two decades since its establishment in 1917 by Julius Rosenwald, this fund has expended approximately fourteen million dollars (\$13,927,846), being all of its income from year to year and about two-thirds of its principal fund. At the close of the past fiscal year, June 30, 1937, the capital of the fund (held chiefly in capital stock of Sears, Roebuck & Co. of Chicago) had a value of approximately six and a half million dollars (\$6,534,637).

The chief program of the fund during its early years was aid in the building of rural public schools for Negroes. The main programs at present are (1) improving the content and quality of rural education in both white and Negro schools in the South; (2) aid in building up four important centres of higher education for Negroes: Howard university in Washington, D.C., Atlanta university in Atlanta, Georgia, Fisk university in Nashville, Tennessee, and Dillard university in New Orleans; and (3) a series of fellowships for Negroes and for white Southerners. During the past year the fund expended \$691,763 upon these and related programs.

**Rothschild, Lionel Walter Rothschild,**

2ND BARON (1868-1937), F.R.S., British zoologist; born in London, Feb. 8. He was educated at Bonn and Magdalene college, Cambridge, and represented the Aylesbury division of Buckinghamshire in Parliament as a Liberal-Unionist from 1899 to 1910. He became a trustee of the British museum in 1899, was elected an F.R.S. in 1911, and in 1915 succeeded his father as Baron Rothschild of Tring. Lord Rothschild was known to the public chiefly as the founder and maintainer of the private zoological museum at Tring, of its kind one of the most complete

UNIVERSITY OF WASHINGTON CREW, winner of the intercollegiate national rowing title in 1937

and best-equipped privately-owned institutions in the world. In 1932 the burden of maintaining this museum proved so heavy that he was compelled to sell his collection of birds to the United States. Lord Rothschild was unmarried, and is succeeded, as 3rd baron, by his nephew, Nathaniel Mayer Victor Rothschild. The late baron wrote, as well as numerous articles on zoology, *Avifauna of Laysan*, and was joint-editor of *Novitates Zoologicae*, published at the Tring zoological museum. He died at Tring Park, Herts., Aug. 27, 1937.

**Roussel, Albert** (1869-1937), French composer, was born at Tourcoing, April 5, 1869. After four years in the navy following graduation from the Naval School, he studied at the Schola Cantorum from 1894 to 1902 and joined the teaching staff after a year in Italy. He composed constantly during these years, but it was only following his service in the World War that he revealed his greatest talent and secured international recognition. Since the compositions listed in the *Encyclopædia Britannica*, vol. 19, p. 587, he composed *La Naissance de la Lyre* (1925) and the ballet, *Bacchus and Ariadne* (1930). He died in Paris, Aug. 24, 1937.

**Rowell Commission, The:** see CANADA: *The Rowell Commission*.

**Rowing.** The 1937 intercollegiate rowing season opened April 17 with the 34th annual California-Washington regatta on the Oakland estuary in California and an informal race between Columbia university and Manhattan college in New York city. Washington scored a clean sweep for the second successive year, winning the varsity, junior varsity and freshman races by wide margins. The personnel of the Washington varsity was, except for two positions, the same as that of the 1936 crew which won the Pacific coast and Poughkeepsie regattas and the Olympic championship at Berlin. Columbia likewise opened with a clean sweep over their less-experienced Manhattan opponents.

The Eastern college rowing season opened officially April 24 with three regattas. The Naval Academy crews won sweeping victories at Annapolis over Columbia in the varsity, junior varsity and freshman races. The annual Compton Cup regatta between Harvard, Princeton and the Massachusetts Institute of Technology was won by Harvard on Lake Carnegie in a very close race. Rutgers defeated Manhattan on the Raritan river. The Blackwell Cup race was held May 1 on the Harlem river and the Yale varsity won by several lengths with Columbia beating

Pennsylvania for second place. The Navy crews again scored a clean sweep on the same day. Racing Princeton and Syracuse on Lake Carnegie the veteran midshipman varsity was soundly tested over the entire mile and three-quarters course and showed promise of being a championship crew. The Harvard crews won all races over Rutgers and Massachusetts Institute of Technology in the Rowe Memorial Cup regatta on the Charles River Henley course.

Two regattas on May 8 found Navy and Harvard decided pre-race favourites. The Navy crews won their third consecutive clean sweep, this time at the expense of Cornell, who were making their début in the current racing season. The Cornell crews showed promise even in defeat. Harvard crews likewise continued their winning streak, overwhelming Columbia and Massachusetts institute on the Charles in all races. Two important races were held on May 15. The Childs Cup regatta was won by Princeton, defeating Pennsylvania and Columbia in that order after a gruelling race over the Henley distance on the Schuylkill river. The Harvard varsity held its undefeated position by vanquishing Cornell, Syracuse and Massachusetts institute, thus scoring its fourth consecutive victory. The following Saturday, May 22, Yale finished its short distance season undefeated, winning the Carnegie Cup race over Princeton and Cornell. The Princeton crew continued its fine performance of the previous week and gave Yale a close race over the entire two miles on the Housatonic, losing by a half length. The Adams Cup race was a fitting climax for the Eastern short distance racing season. The undefeated crews of Harvard and Navy were pitted against each other in a triangular race which included Pennsylvania. Shortly after the start the two favourites were battling each other on practically even terms and paying little attention to Pennsylvania which had surprisingly gone out to a half-length lead. Against two such powerful crews Pennsylvania had wisely determined to take the lead at all costs. A half mile from the finish they still retained their lead, but shortly thereafter the pace proved too much and Navy slowly forged into the lead, closely followed by Harvard. Rowing a much lower stroke Navy warded off the high stroke of the Harvard sprint and crossed the finish line slightly ahead. The freshmen and junior varsity crews having previously won their races the jubilant Navy oarsmen could now head for Poughkeepsie with the record of four consecutive clean sweeps and were thus established as worthy challengers of the Washington supremacy. That same day at Ithaca Syracuse defeated Cornell in a close race by one length.

*The Poughkeepsie Race.*—Seven varsity crews lined up at the

start of the annual Poughkeepsie race in the late afternoon of June 22nd. The Washington freshman and junior varsity crews had already done their share toward a clean sweep by winning with ease and the powerful Navy crew seemed the only entrant capable of defeating the Washington varsity. True to predictions the race soon settled into a battle between Navy and Washington, but by the half-way mark Washington had firmly established a lead and from there to the finish drove steadily ahead. Navy in desperately trying to hold to them were nearly overtaken in the closing minutes by a fine rowing Cornell crew. Washington crossed the line the winner by about three lengths and in this victory established a record not equalled in the history of the Poughkeepsie regatta, making a clean sweep of the three races for two consecutive years. The other crews, in the order finished, were Syracuse, California, Columbia, and Wisconsin.

*Yale-Harvard Regatta.*—The seventy-fifth Yale-Harvard regatta brought to a close the intercollegiate rowing season. The evening of June 25th the two varsity crews lined up near New London on the Thames for the four-mile race up-stream. The Harvard crew, defeated only by Navy, was the favourite by virtue of its easy victory over Yale the year before, but a greatly improved Yale crew which had come through the short distance races undefeated promised a close and stirring race. Yale took the lead at the start, but soon relinquished it and by the half-way mark Harvard, rowing several strokes lower and leading by nearly two lengths looked an easy winner. Coming into the three-mile mark Yale began cutting down this lead and a half mile from the finish was lapping the stern of the Harvard shell. Over the last quarter mile both crews raised their strokes to nearly forty to the minute and Harvard slowly forged ahead again to finish slightly more than a length in front of the game Yale crew. Both crews broke the course record under moderately fast conditions.

In the lightweight branch of intercollegiate rowing Massachusetts institute won the Joseph Wright Challenge Trophy by defeating Harvard, Yale, Cornell, Princeton, Columbia, and Pennsylvania and the Yale crew won the Yale-Harvard-Princeton championship. The third annual interscholastic rowing championships were rowed at Worcester, Mass., on May 29th, bringing to a close the school-boy rowing season in the United States. Tabor academy won the senior and junior eight-oared races and Brooks school the senior four-oared race.

(E. O. LE.)

*Great Britain.*—For its chief event, the year 1937 will be remembered for the fact that Oxford brought the long term of 13 Cambridge successes to an end. Cambridge, early in preparation, suffered a loss of the first magnitude when their president, W. G. R. M. Laurie, accepted a post in the Sudan civil service. A born stroke and an oarsman of the first class, there was no one adequately to replace him. On the other hand, paradoxical though it may seem, the lion's share of the credit for Oxford's victory must be given to their president, J. S. Lewes, who at the end of training was not found good enough to be included in the crew which he had done so much to make.

For the first time for some years, Lewes decided to rely on old Oxford Blues for coaching, and obtained the help of Dr. P. C. Mallam (1921, 1922, 1923, 1924), Mr. G. O. Nickalls (1920, 1921, 1922, 1923), and Mr. W. Rathbone (1926, 1927). The Cambridge coaching was undertaken by Sqdn.-Ldr. F. E. Hellyer (1910, 1911), Mr. J. Beresford, Jr., of Thames R.C., Mr. J. F. R. Best, the old Pembroke stroke, and Mr. K. M. Payne (1932, 1934). After Laurie's departure, H. W. Mason, the "two" of 1936, was considered likely to stroke the crew, but he met with an accident during the vacation, and could not row until a month before the race.

Just before the race, changes were made in the bows of the Oxford crew, D. R. B. Mynors (1935) being replaced by R. R. Stewart, and Lewes by D. M. de R. Winsor (1935, 1936). The general public saw only fatal indecision in these changes, and Cambridge started favourites. They won the toss and took the Surrey side.

After a false start, Mr. Harold Rickett (Cambs. 1931, 1932), the umpire, got the crews away. Owing to the great amount of land water meeting a slack neap tide, the time was bound to be slow, and a light westerly wind did nothing to assist the crews at any point. At the end of a minute at the higher rate Cambridge had a substantial lead, but Hodgson crept up to lead by a few feet at the mile post (4mins. 39secs.). Repeated spurts kept Cambridge on terms, but Hodgson never allowed them to gain more than a few feet. At Hammersmith, in great danger of a foul, the boats were level (8mins. 24secs.). Along the Eyot, Perfitt made several spurts, but Hodgson always drew him back, and was leading at Chiswick Steps (13mins. 3secs.). After giving way to avoid a foul, the Oxford crew gained steadily up the Duke's Meadows, and were clear at Barnes Bridge (19mins. 34secs.). Though Cam-

"SHOOTING HAMMERSMITH BRIDGE" in the Oxford and Cambridge boat race, won by Oxford

bridge spurted all the way home, Hodgson did not raise the rate until the Brewery, and then went away very fast to win by three lengths in 22mins. 39secs.

On Easter Sunday the Oxford and Cambridge crews raced against two Paris crews on the Seine, each of the English crews winning comfortably. In the summer Eights at Oxford, Oriel lost the Headship to New College, while in the Mays at Cambridge, Jesus retained their position.

At Henley Royal regatta, English oarsmen met with defeat in three events—the Rudergesellschaft Wiking crew from Germany winning the Grand Challenge Cup; J. Hasenohrl, Ruderverein Ellida, Austria, taking the Diamond Sculls; while Tabor Academy, U.S.A., won the Thames Cup for the second year in succession.

In their heats the Germans beat New College easily and London R. C. by  $2\frac{1}{2}$  lengths, but in the final they were given a splendid race by Jesus College, Cambs., a resident undergraduate crew. At Fawley the English crew had three-quarters of a length, but at the mile the boats were dead level. In the spurt home the Germans went away to win by half a length in 7mins. 33secs. in a strong head-wind.

Coulson, the Canadian sculler, was undoubtedly Hasenohrl's strongest competitor, and met him in the final of the Diamonds, but the race was robbed of all interest when Coulson hit the piles above the quarter-mile when leading slightly.

Tabor Academy were not quite as fast as in 1936, when they beat Kent School, U.S.A. in the final of the Thames Cup, and London R. C. "B" crew were on terms with them to the enclosure, when the American boys went away to win by one length in the fastest time of the day, 7mins. 31secs., the head-wind having dropped considerably. In the other events, Clare, Cambs., won the Ladies' Plate, beating the holders, First Trinity, in the final. Leander, with a good crew, won the Stewards' Cup, while Trinity Hall won the Visitors' easily from Oriel. London R. C. "B" crew won the Wyfolds, and E. W. Wingate and W. D. Baddeley, Vesta R. C., won the Goblets.

During the year, the A.R.A. widened the definition of an amateur oarsman by deleting all reference to manual or menial labour as a bar to the status. The stewards of Henley regatta accepted the alteration, and further deleted their rule forbidding professional coaching. These alterations took effect on Jan. 1, 1938.

In professional sculling, Eric Phelps retained the title of champion of England, and won a stake of £200 from Lou Barry in a race from Putney to Mortlake on March 29. There was a splendid struggle to Chiswick Steps, but after that Phelps went away to win by five lengths in the slow time, due to bad conditions, of 24mins. 50secs. (G. C. D.)

## Royal Academy of Arts.

During the year (from Nov. 1936), the following elections were made: Royal Academicians (R.A.)—F. Cadogan Cowper, Dame Laura Knight, Gilbert Ledward, Sir Edwin Cooper, Gerald Brockhurst (all previously A.R.A.'s.); Associates (A.R.A.)—Charles Cundall, Eric Gill, Stephen Gooden, James Woodford, C. H. James. The annual summer exhibition at Burlington house, Piccadilly, London (169th; May 3–August 7; 722 oil-paintings, 367 water-colours and miniatures, 168 sculptures, etc.) attracted 102,000 visitors. A coronation year feature was an historical series, "Royal Patrons of the Royal Academy," with "H. M. King George VI," by Simon Elwes.

Though representative of current trends in technique, the exhibits included no work of a dozen or more representative British artists, such as W. R. Sickert and Stanley Spencer, who had resigned from the academy, Wilson Steer, Paul Nash and Jacob

Epstein. There is a growing tendency for artists to exhibit in London galleries. Even some leading painters seem, today, to take the composition and lighting of posed subjects as they happen to come. Perhaps accordingly, landscapes were a step in advance of portraiture in interest; still life and nudes were out of favour. While there was, by general consent, no "picture of the year" "The Founding of Australia by Captain Arthur Philip, R.N.," by Algernon Talmage, R.A., drew much attention. Sir William Llewellyn, president (since 1928), announced that the winter exhibition (Jan. 3–March 12, 1938) will be of 17th-century European art.

An innovation was the architectural exhibition, held at Burlington house during the autumn—virtually a review of leading designs of the present century. (H. Fw.)

**Royal Canadian Mounted Police:** *see* POLICE.

## Royal Geographical Society.

There was a marked increase in the strength of the society. Of expeditions in which the society is interested several completed their work. The British Graham Land expedition (leader, John Rymill) returned after  $2\frac{1}{2}$  years in the Antarctic; Mr. R. Kaulback completed a valuable survey of the Salween valley and surrounding areas in S.E. Tibet; consul, Lars Christensen discovered new land and new mountain ranges in the Antarctic; Chomolhari was climbed in May by F. S. Chapman, and other mountaineering expeditions were completed, notably that by F. S. Smythe, who made valuable plant collections in the Himalayas. The society completed a map of the Karakorum which has had the approval of the surveyor-general of India. Many lectures were delivered during the year, and the use of the instruction room by intending travellers continues to grow.

## Royal Institution of Great Britain.

The lecture program was varied in character, and afternoon courses and evening discourses by the professors of the institution and others on scientific subjects, literature, history, and music, included a number of experimental lectures. The year was completed with a course of juvenile lectures on "Rare animals," by Dr. J. S. Huxley. The general program of the Davy Faraday research laboratory (Director, Sir Wm. Bragg) dealt mainly with the connection between the physical properties of organic substances and their structure and with structure determination of organic crystals by aid of X-rays. Work was started on the application of short electric waves to the study of organic solids and the extension of optical investigations towards the infra-red.

## Royal Society of London.

The society completed 275 years of existence. It was decided that 20 fellows will be elected annually in the future instead of 17. The total expenditure authorized for research was £33,500. The council arranged, through the development commissioners, for a grant of £5,100 for capital expenditure and £3,500 a year for five years to cover the cost of intensive study of the Gulf Stream and Atlantic Drift which are thought to affect fisheries of the United Kingdom. The Pilgrim Trust offered 250 guineas annually for six years to allow an annual lecture, to be arranged jointly by the Royal Society and the National Academy of Sciences, to be given alternately in London and Washington. On November 30, Sir Wm. Bragg read his presidential address on "The grain-like structure of solids." Medals were awarded as follows: *Royal*, Prof. N. V. Sidgwick, Prof. A. H. R. Buller, Copley, Sir Henry Dale. *Davy*, Prof. Hans Fischer. *Sylvester*, Prof. A. E. H. Love. *Hughes*, Prof. E. O. Lawrence.

**Ruanda and Urundi:** *see* BELGIAN CONGO.

**Rubber and Rubber Manufacture.** During 1937 the rubber industry made technological progress in many ways. The most notable development of new material was the expansion in Germany of manufacturing facilities for the synthetic elastic, Buna. Varieties of Buna have proved superior to natural rubber in resistance to abrasive wear, oil, heat and diffusion of gases and it is predicted that further increased production will reduce its cost to a competitive level. Only recently have these synthetics been made available outside Germany. In America improvements in the synthetics, Thiokol and Neoprene, have promoted their use in services for which their striking resistance to oils, solvents or sunlight oxidation render them superior to rubber. Uses with rubber of the chemically inert poly iso butylene have also been developed. Koroseal, plasticized gamma polymer of vinyl chloride, has found new applications where sufficient resistance to oils, corrosive chemicals or water and non-inflammability could not be attained by rubber compounding. In Germany, also, similar products have been utilized extensively. Neoprene and Koroseal have interested cable manufacturers as insulators highly resistant to ozone. Of scientific interest was the description from France of an inorganic rubber-like material consisting of polymers of phosphonitrile chloride. Shipping of pellet carbon black in bulk instead of packages is increasing, producing savings in handling costs. New softeners for rubber, acids produced by oxidation of petroleum, have also been introduced. Patents issued in various countries evidence continued research and accomplishment in the study of organic accelerators and age resisters. Additional accelerators inert at milling heat but rapidly active at vulcanizing temperatures have been discovered. Notable, too, was the discovery of an age resister, hydroquinone mono benzyl ether, non-staining on exposure to light, which imparts to rubber compositions excellent flexure resistance in addition to retarding their deterioration.

In America the improvement of tires for high speed service through the use of rayon cords was a striking innovation in the use of textile materials; but newly developed cotton cords, characterized by low permanent set after stretching, produced tires of even better quality.

**Processing.**—Researches in plastication of rubber have resulted in improving this important operation. Plasticators are now designed for operation at temperatures much higher than were formerly employed, producing rubber of greater plasticity at lower cost. Chemical softening by addition to the rubber, during plastication, of small proportions of certain hydrazines or thio-naphthol has proved valuable, also. For rubber cements a new type of closed mixer in which a swirling motion is imparted by propeller-type stirrers, top and bottom, greatly reduces solvent losses and speeds the dispersion of the rubber. For forming articles from Neoprene dispersions methods have been perfected similar to the Anode process for deposition of rubber from latex.

**Products.**—As in former years, the usefulness of rubber has extended into new fields. New or increased uses were developed for Pliofilm as package wrappings, bottle seals, rain capes and umbrellas. Elimination of noise and vibration by supporting machinery on rubber in shearing suspension has proved effective. In several American cities several hundred street cars recently equipped with similar shear type rubber springs ride more quietly and smoothly than those mounted on steel springs. The use of sponge rubber for cushioning seats in railroad cars and automobiles, first adopted in England, has increased rapidly in America. For gasoline hose, linings of Neoprene containing imbedded wires to ground static charges largely replaced in manufacture the older

## RUANDA AND URUNDI—RUMANIA

flexible metal tubes with rubber sheaths.

Rubber plates for printing food wrappers, telephone directories and business forms have found increasing use. The utility of transmission belting has been increased through the invention of a portable vulcanizer and a special splicing technique enabling purchasers to make belts endless wherever they are to be used. A long-standing need for improved sealing of bell and spigot joints in clay pipe is now satisfied by rubber rings which hold without leakage against pressures capable of bursting the pipe. Rubber sealing strips for joints in concrete roads or abutments overcome disadvantages of poured fillers. Substitution on tractors of the many-jointed metal bands by endless rubber tracks permits faster travel, decreases wear and increases fuel economy. Rubber putty, permanently flexible, has proved valuable for greenhouses and other metal sash windows where expansion or vibration cause ordinary putties to crack and loosen. For information on synthetic rubber *see* also CHEMISTRY, APPLIED; INDUSTRIAL RESEARCH.

**BIBLIOGRAPHY.**—Among publications, *The Chemistry and Technology of Rubber*, compiled under the auspices of the American Chemical Society is of outstanding value. (J. W. Sc.)

**Rubber Footwear:** *see* SHOE INDUSTRY: *Rubber Footwear*.

**Rubio y Lluch, Antoni** (1856–1937), Spanish Catalan scholar; born at Valladolid, July 24. He was for 41 years professor of Spanish literature at the University of Barcelona; and since 1904 was professor of Catalan literature at the Institute of Catalan Studies. One of the finest Catalan scholars who have lived, his most enduring monument is, perhaps, the *Documents for the Study of Mediaeval Catalan History*. He died at Barcelona, June 9, 1937.

**Ruby:** *see* GEMS AND PRECIOUS STONES.

**Rugby:** *see* FOOTBALL: *Great Britain*.

**Rumania**, a monarchy of S.E. Europe and member of the League of Nations. Bounded W. by Hungary, N.W. by Czechoslovakia, N. by Poland, E. by the U.S.S.R., S.E. by the Black sea, S. by Bulgaria, S.W. by Yugoslavia. Ruler, King Carol II. Flag, blue, yellow, and red in vertical stripes.

**Area and Population.**—The area is 113,884 sq.mi.; estimated population (1936), 19,423,000. Of these, about three-quarters are Rumanians, and members of the Orthodox or (in the case of a part of the Transylvanian Rumanians) the "Uniate" Church. The Magyars (Catholic, Protestant, and Unitarian) number about 1,500,000. They live chiefly in Western Transylvania and the "Székely" districts of E. Transylvania. The 750,000 Germans are chiefly in the Banat (Catholic) and Transylvania (Lutheran). The 5–600,000 Ukrainians, 1–200,000 Russians, and perhaps 250,000 Bulgars inhabit Bessarabia and the Dobruja. The Jews (about 1,000,000) are chiefly in Moldavia and Bessarabia, but not rare in any part of the country.

The chief towns, with estimated population (1936) are: Bucharest, 641,421; Chişinau, 114,954; Cernauti, 110,609; Jaşi, 104,523; Galati, 102,106; Cluj, 99,496; Timişoara, 99,349; Oradea Mare, 81,413; Ploest, 76,773; Arad, 76,333; Brăila, 68,981; Braşov, 60,556.

Education is free and compulsory. In the Old Kingdom, it is in the hands of the State; the national minorities in Transylvania are allowed to use the Confessional system.

**History.**—A swing towards "fascism" of some sort has been apparent in recent Rumanian politics. The resignation of M. Titulescu as foreign minister (Aug. 29, 1936) inaugurated a period more sympathetic to Germany and Italy and even more cautious towards the U.S.S.R. Although Rumania still held by the Little

CRUDE PETROLEUM PRODUCED in Rumania

Entente, her relations with Poland, marked by many exchanges of visits, grew closer. In internal politics, an increasing agitation, directed mainly against Jews, but also against the other national minorities, was conducted by the parties of the extreme Right, under the slogan "Rumania for the Rumanians." In Dec. 1937 general elections were held, and although they were conducted by the Liberal Party, that party, in alliance with the Rumanian Front, the National Democrats, and the Germans, secured—to the general astonishment—only 152 seats out of 387, the National Peasants securing 86, the "All for the Fatherland" (the proscribed "Iron Guard" under another name) 66, the National Christians 39, the Magyars 19, the Dissident Liberals 16, and the Radical Peasants 9. More surprisingly still, the king entrusted the Government to M. Goga, the leader of the National Christians, who on Dec. 29 formed a cabinet consisting of members of his own party, with 4 National Peasants, who were promptly expelled by their own party. M. Codreanu, leader of the "All for the Fatherland," expressed his sympathy. The year closed amid great uneasiness among many sections of the population, particularly the Jews.

**Trade, Communications, Finance.**—The monetary unit is the leu, nominally equal to 0.5982 gold cents, but now considerably depreciated. The budget was balanced in 1936–37 at 29,887.2 million lei, and for 1937–38 a balanced budget of 28,698.2 million lei was estimated. The foreign trade has recently increased rapidly, with a large export surplus (1935, imports 10,884,753 million lei; exports, 16,756,223 million lei). The chief exports are petroleum and wheat. Agriculture remains the backbone of the national economy. The young industry is being fostered by protection; the average of industrial employment for 1936 was 153 (average 1925–29, 100). Industrial unemployment is low; wages are, however, exceedingly small.

**Defence.**—Military service is compulsory and universal. The budgetary effectives of the army in 1937–38 numbered 14,890 officers and 49,525 other ranks. Rumania is re-equipping her army, and in 1937 placed large orders for that purpose with Czechoslovakia. A line of fortifications is planned to extend around the entire country. (See also ANTI-SEMITISM; LITTLE ENTENTE.) (C. A. M.)

**Runciman, Walter Runciman,** 1ST BARON OF SHORESTON (1847–1937), British shipowner; born July 6. He went to sea before the mast as a boy, obtained his master mariner's certificate in 1871, and gradually acquired his own fleet of ships. Eventually he founded, and was senior partner of, Walter Runciman & Co., Ltd., of New-

castle-on-Tyne; was chairman and managing director of the Moor line, and, in 1935, became chairman of the new Anchor line. From 1910 to 1911 he was president of the chamber of shipping of the United Kingdom. From 1914 to 1918 he was Liberal M.P. for Hartlepool. He was created a baronet in 1906, and was raised to the peerage in 1933. His only son is the present Viscount Runciman. Lord Runciman's publications include *Windjammers and Sea Tramps* (1903); *The Shellback's Progress in the 19th Century* (1905); *Looking Seaward Again* (1907); *The Tragedy of St. Helena* (1911); *Drake, Nelson, and Napoleon* (1919); *Before the Mast—and After* (1924) autobiography; *Collier Brigs and their Sailors* (1927); and a series of *Sunbeam Logs*. He died at New-castle-on-Tyne, Aug. 13, 1937.

**Running:** see TRACK AND FIELD SPORTS.

**Rural Electrification.** Extensive construction of new rural electric lines marked the progress of rural electrification in 1937. In the United States more than 225,000 rural families received electric service for the first time and more than 150,000 of these new customers were farm families. This indicates a gain of approximately 50% over the number of farms electrified in 1936. At the end of 1937, about 1,200,000 or 18% of the farms of the United States were electrified.

The rural electrification program of the Federal Government made an important contribution to activity in the field of rural electrification. This program stimulated rural line construction by the private utilities to such an extent that they expected to build in 1937 41,000 mi. of rural distribution lines—9,000 mi. more than they constructed in 1936. Projects financed by the Rural Electrification Administration completed about 15,000 mi. of new rural distribution lines during the year, and had approximately 50,000 mi. more under construction.

Prior to the Federal Government taking an active part in assisting the farmer to secure electricity, practically all farms served with electricity were served by private utilities. As a result of the activities of the Tennessee Valley Authority and those of the Rural Electrification Administration, a small but increasing percentage of farms are being served by farmer owned and controlled distributing systems. During 1937 important modifications in State statutes, in new rulings of public service commissions, and in government loans contributed to this trend.

Increasing emphasis during the year was placed upon developing increased use of electricity in rural areas. Education of the farmer in the many advantageous uses of electricity made him desire its more abundant use and somewhat lower rates made it possible for him to gratify this desire. The increases reported in the sales of electric appliances in rural areas provide evidence of an increase in the average consumption per customer during the period.

In Great Britain progress resulted from the gradual extension of rural electric distribution lines. It is estimated that a total of 30,000 farms were receiving electricity in 1937. This figure may be contrasted with 25,000 in 1936 and 4,000 in 1932. As in Great Britain there are reported to be nearly 450,000 farms and small holdings of over one acre, it will be seen that only a small proportion of the total are as yet connected.

Various demonstration schemes reported increasing success in securing additional customers and in increasing the average consumption per customer. A number of new proposals were advanced for the supply of electricity in undeveloped portions of the areas of supply of various undertakings and approved proposals were advanced during the year.

The record of existing rural lines in Great Britain, and the lessons learned from pioneering work in rural electrification are

making it possible to consider with confidence comprehensive plans for the extension of rural electric lines. Engineering difficulties have been overcome and there is a more general appreciation of the financial feasibility of rural electric development when reasonable time is allowed for a development period, and when all costs including construction and operation are kept low and free from extraneous charges of all sorts. (See also ELECTRICAL ENGINEERING; ELECTRIC TRANSMISSION AND DISTRIBUTION: *Distribution*; ELECTRIC TRANSPORTATION; PUBLIC UTILITIES.)

(J. M. CY.)

**Rural Electrification Administration:** see ELECTRICAL INDUSTRIES.

**Russia:** see UNION OF SOVIET SOCIALIST REPUBLICS.

**Russian Arctic Fliers:** see ARCTIC EXPLORATION.

**Russian Literature.** The commemoration in 1937 of the centenary of Pushkin's death consecrated the recent tendency towards a revaluation of literary and artistic values in a sense hostile to revolutionary modernism. It gave rise to a vast literature of a biographical, historical, and critical character.

The slogan of "Socialist realism," proclaimed in the U.S.S.R. since 1932, continues to preside over Soviet literature. The actual literary output during 1937 has been rather scanty; a new novel by Ehrenburg on the topical subject of the Spanish civil war, *Chto cheloveku nado* (*What Man Needs*); a short novel by Valentin Kataev, *Ya, syn trudovogo naroda* (*I, Son of the Toiling People*), dealing with the civil war in the Ukraine in 1918-19; Pavlenko's much-discussed and greatly praised *Na Vostoke* (*In the East*), a kind of military Utopia describing Soviet activities in the Far East and the future war with Japan; the fourth volume of Sholokhov's *Tikhly Don* (*The Quiet Don*); Alexey Tolstoy's *Khleb* (*Bread*), retrospective in subject but topical in its glorification of Stalin and Voroshilov; and the first two parts of Tynyanov's *Pushkin*, a novelized biography—such is the balance-sheet of the year's notable fiction. Nor has anything outstanding appeared in the domain of poetry and drama. One of the features of the year's literary life has been the official press campaign against a number of poets, playwrights, and critics, including the leading Soviet Russian poet, Boris Pasternak, who has been attacked for his individualistic, non-political, and unpatriotic attitude. Other victims came from the opposite camp, as e.g., the poets Bezymensky (who at one time aspired to the role of the Soviet poet-laureate) and Tretyakov (author of the well-known propaganda play *Roar, China!*), and the playwrights Afinogenov and Kirshon, whose popularity was extremely great during the period of the first five-year plan. Afinogenov, Bezymensky, and Kirshon in connection with the political drive against "Trotskyism," have been expelled from the Communist Party. The "anti-modernist" (or, in Soviet terminology, "anti-formalist") campaign begun in 1936 at Stalin's personal initiative with the attacks on the well-known composer Shostakovich, culminated in Dec. 1937 in the "disgrace" of the famous theatrical producer, Meyerhold.

Four writers—Korniyuchuk, Sholokhov, Stavsky, and Alexey Tolstoy—had the honour of being elected to the new Soviet parliament.

Three prominent men of letters died in the U.S.S.R. during 1937: Alexey Chapygin (b. 1870), author of the historical novel *Razin, Stepan* and other works; Ilya Ilf, joint author with Evgeny Petrov of two successful satirical novels (*Twelve Chairs* and *The Golden Calf*), and of numerous short stories; and Suleiman Stalsky (b. 1869), the *ashug*—or national bard—of Daghestan.

Almost the only outlet of Russian literature outside Russia is

the sole surviving émigré review—*Sovremennyya Zapiski* (Paris). Among the individual fiction works of the year may be noted Aldanov's *Peshchera* (*The Cave*); the first instalments of Nabokov-Sirin's *Dar* (*The Gift*); and Boris Zaitsev's *Puteshestvie Gleba* (*Gleb's Journey*), the first part of a vast work of obviously autobiographical nature, somewhat akin to Bunin's *Life of Arsenyev* (*The Well of Days*).

By the sudden death, in Paris, of Evgeny Zamyatin (b. 1884) Russian literature has sustained a heavy loss. The return to the U.S.S.R. of the well-known novelist Kuprin was the first case of its kind since the return of Alexey N. Tolstoy in 1922. (G. ST.)

**Russian S.F.S.R.** (The Russian Soviet Federated Socialist Republic) is in area and population the largest, and politically, economically, and culturally, the most important republic of the Soviet-Union; bounded N. by the Arctic ocean; W. by Finland, Estonia, Latvia, White Russia, and the Ukraine; S. by the Black sea, the Transcaucasian republics; Kazakhstan, Mongolia, and Manchoukuo; E. by the Pacific ocean and Japan. Capital, Moscow. Flag, red ground, gold initials PCFPCP in top left corner. Leading cities: Moscow (1936) 3,567,900 inhabitants, Leningrad (1935) 2,739,800, Gorky (formerly Nizhni-Novgorod) 512,600, Rostov on the Don 479,400, Sverdlovsk (formerly Ekaterinburg) 450,000, Stalingrad (formerly Tsaritsyn) 390,000, Saratov 340,000, Novo-Sibirsk (formerly Novo-Nikolaevsk) 310,000 inhabitants.

**Area and Population.**—Area, 16,499,000 sq.km. (about 78% of the whole Soviet Union), including the most varied natural zones; the tundra, the forest, steppe, and desert zones. Population (1937), 113.6 millions, of whom 73.4% are Russians, 7.8% Ukrainians, and 2.8% Tatars. There were, in 1936, 107,500 schools; and the total number of scholars (1936-37) was 17,658,000.

**History.**—After the adoption of the new All Union Constitution on Dec. 5, 1936, which aimed at the democratization of the State structure of the U.S.S.R., the R.S.F.S.R. at its 17th Extraordinary All Russian Soviet Congress in Moscow on Jan. 21 also adopted a correspondingly revised constitution. At present 17 autonomous republics, 6 autonomous territories, and 5 territories belong to the R.S.F.S.R. The number of other administrative units—the provinces—has been increased by several decrees to 27 in Sept. 1937. The R.S.F.S.R. took fourth place in the elections to the Supreme Council of the U.S.S.R. with a percentage of 96.8. In the autumn of 1937, a drastic purge of State and party took place. The war hitherto carried on against class enemies was now turned against the élite of the officialdom and the party who were suspected of counter-revolutionary activity and betrayal of the people. One of the first to be imprisoned in R.S.F.S.R. was the premier of the republic, D. Sulimov. A. I. Bubnov, for many years people's commissar for education was another member of the Lenin old guard to be deprived of his office for "incompetence and harmful work." In the individual autonomous republics attached to the R.S.F.S.R., such as Buryat-Mongolia, Karelia, and Chechen-Ingush A.S.S.R., many of the leading personalities have fallen victims to the drive against Trotskyists, wreckers, spies, etc.

**Trade and Communication.**—Agriculture.—Sown area (1936), 353,874 sq.mi.; 92.6% peasant households collectivized. Grain production (all kinds) is chiefly in the Black Earth region of Central European Russia, on the Central Volga, in North Caucasus, Don Territory, and West Siberia; sugar beets, potatoes, flax, fruit, and tobacco (Black sea) are produced. Cattle and dairy farming are practised.

Natural resources include iron ore, coal, oil, gold, platinum, copper, zinc, lead, peat, timber, furs, fish, water power.

Retail trade turnover (1936) 68.3 milliard roubles. Export articles: machines, chemicals, textiles, oil, metals, grain, sugar, potatoes, flax, vegetable oil, fruit, fish, cattle, dairy products, timber, matches, paper, furs, building materials, etc. Output of industry (1936, at prices 1926-27): 56,495 million roubles. Output of electricity: 21,419 million kilowatt-hours.

Main industries: coal and iron mining, gold-mining, oil industry, machine building, metallurgy, chemicals, timber, textiles, food, building. Length of railways (1936), 60,963km.; length of navigable rivers (1935), 69,453km. (S. YAK.)

**Rutherford, Ernest Rutherford,** 1ST BARON (1871-1937), O.M., F.R.S., British physicist; born at Nelson, New Zealand, August 30. He was president of the Royal Society, 1925-30; chairman of the Advisory Council of the Department of Scientific and Industrial Research, 1930-37; and director of the Royal Society Mond Laboratory, Cambridge, 1936-37. In 1931 he was raised to the peerage, taking the title of Baron Rutherford of Nelson and Cambridge. When, in 1933, German scientists and scholars began, for racial reasons, to lose their posts, Lord Rutherford was a founder and the first president of the Academic Assistance Council, since renamed the Society for the Protection of Science and Learning. Chief among his later publications was *Radiations from Radio-active Substances* (1930, with James Chadwick and C. D. Ellis). He died at Cambridge, Oct. 19, 1937. For details of his career see *Encyclopædia Britannica*, vol. 19, p. 773.

**Rye.** A short crop in Europe, owing chiefly to low yields in Poland and Germany, may result in the United States again becoming the leading rye exporting country, a position held usually by Poland since 1928 and at times before that by the United States. The estimated Polish crop this year is about 224,400,000bu., compared with 250,541,000 in 1936. In the United States the crop was 49,449,000bu. as against 25,319,000 in 1936, while in Canada the 1937 harvest was 4,276,000bu., compared with 3,042,000 the previous year. Annual consumption in the United States is about 34,000,000, leaving about 15,000,000bu. for export. About 7,500,000bu. for flour milling and about 11,500,000bu. for distilling are among the estimates for this year's crop usage in the United States. In Germany the 1937 rye harvest was 252,000,000, compared to 290,788,000bu. in 1936 and the government has forbidden the feeding of rye to livestock. The total harvest of 16 leading rye-growing countries in Europe was 685,368,000bu., which is 56,000,000bu. less than the small crop of 1936. Other production comparisons are Czechoslovakia, 56,549,000bu. in 1936 and 59,100,000 in 1937. Hungary, 28,114,000 in 1936 and 25,350,000 in 1937. Austria, 18,129,000 in 1936 and 17,700,000 in 1937. Netherlands, 19,059,000 in 1936 and 16,500,000 in 1937. Rumania, 17,842,000 in 1936 and 15,700,000 in 1937. Sweden, 13,891,000 in 1936 and 15,700,000 in 1937. Finland, 12,755,000 in 1936 and 14,960,000 in 1937. Bulgaria, 8,688,000 in 1936 and 9,800,000 in 1937. Estonia, 6,044,000 in 1936 and 8,110,000 in 1937. Portugal, 3,652,000 in 1936 and 4,650,000 in 1937. Greece, 1,919,000 in 1936 and 2,990,000 in 1937. (See also CEREALS.) (S. O. R.)

**Sahara, The:** see FRENCH WEST AFRICA AND THE SAHARA.  
**Sailing Ships:** see SHIPPING, MERCHANT MARINE: *Sailing Ships*.

## St. Helena and Ascension Island.

These two south Atlantic islands form a British crown colony. St. Helena lies in S. lat. 15°55' and W. long. 5°42', and Ascension

Island is 700mi. to the N.W. The governor and commander-in-chief is Henry Guy Pilling, C.M.G., and the capital is Jamestown in St. Helena.

**Area and Population.**—St. Helena has an area of 47 sq.mi., and a population of 3,995; Ascension Island is 34 sq.mi., in area, and has a population (1931 census) of 188. The chief towns are Jamestown (1,529), and George Town in Ascension Island.

**Trade, Communications, etc.**—There is monthly communication by Union Castle steamer. In 1936, 850 tons of fibre and 426 tons of tow were exported at £17 and £13 a ton respectively. Garden produce supplied to ships amounted to £578. Imports for 1936 were £1,388.

Revenue for 1936, including a Treasury grant of £23,198, was £3,748 in excess of estimates, owing chiefly to sales of coronation postage stamps. Expenditure was £19,569.

**St. Louis,** a city in the State of Missouri, covers an area of 61.3 sq.mi., with 856,000 persons living within its corporate limits; an additional 211,593 persons reside in St. Louis county, an area of 487 sq.mi., as well as 315,000 persons resident in Madison and St. Clair counties, Illinois, immediately across the Mississippi river, and a real part of the metropolitan district known as Greater St. Louis.

For years one of the largest industrial cities in the Middle West, ideally situated geographically, a hub of rail, air, highway and water transportation, St. Louis enjoyed in 1937 a healthy gain in building over the preceding year, especially of small homes; while the addition of the \$3,500,000 plant for the Crown Can Co., and purchase of 374 acres in St. Louis county by the Ford Motor Co. for one of the firm's largest assembly plants which will employ more than 4,000 workers, gave considerable impetus to the industrial boom.

It is in the fields of art, music, science, education and amusement that St. Louis made its most noteworthy strides during 1937. The City Art Museum acquired "Triptych of Virgin and Child," by Lorenzo di Nicolo Gerini, "The Two Sisters," by Henri Fantin-Latour, both oil paintings, and "The Prophecy of Nathan," a famed Brussels tapestry. Numerous rare specimens were acquired by St. Louis's "Zoo." In the field of science the Award of Chemical and Metallurgical Engineering went to the Monsanto Chemical Co., a St. Louis firm. Both of St. Louis' universities, Washington university and St. Louis university, added chairs in science and the arts to their curricula, while an additional new municipal high school, costing \$800,000, was completed.

Among the more important public buildings constructed during the year were the \$4,300,000 U.S. Post Office and the \$875,000 Municipal Soldiers' Memorial. At the same time the city completed a \$1,500,000 super-highway of the partial-subway type, connecting with main arterial highways leading to the city from all directions and greatly reducing hazards caused by traffic congestion. Long a great medical centre St. Louis dedicated the \$3,000,000 city-built and -owned Homer G. Phillips hospital, and started work on the Bliss Psychopathic Institute to be completed in 1939 at a cost of \$1,000,000. St. Louis presented in 1937 the annual Veiled Prophet Parade, one of the outstanding colourful pageants in the U.S., attracting more than 270,000 persons along the line of march to watch the floats and performers, while the huge Municipal Auditorium was packed to capacity by socialites honouring "His Majesty the Veiled Prophet" at the annual ball. The Municipal Opera, presenting a well-balanced repertoire in the sylvan theatre in beautiful Forest park during the summer months, attracted 774,985 persons from all parts of the world during its most successful season of 1937. The St. Louis Symphony Orchestra under the baton of Vladimir Golschmann, giving its fifty-eighth season of concerts, provided St. Louisans with the

best in music during the fall and winter months.

Among the more important legislative enactments was the passage of a new and stringent anti-smoke ordinance designed to free the city from unnecessary smoke and dirt, and the adoption of a new milk ordinance complying with the U.S. Public Health Standard. The St. Louis Bar Association launched a campaign to disbar unethical attorneys and establish the legal profession on a high plane.

(E. L. R.)

**St. Pierre and Miquelon,** a French colony comprising St. Pierre, Miquelon, and six smaller islands near Newfoundland. Language, French; capital, St. Pierre (pop. 3,396). The area is about 93 sq.mi.; the population by the latest census was 4,175 (1936), a decline of 158 since 1931. The colony is governed by an administrator and partially elected council. St. Pierre is a regular port of call for several British and French transatlantic lines. The colony enjoys excellent cable and radio communication. The sole industry is fishing, for which the islands are an important centre. The trade has, however, seriously declined in recent years, with consequent acute economic depression. Exports in 1936 totalled 38,679,000 francs, imports 13,683,000, against 51,351,000 and 27,995,000 francs respectively in 1935. From 1925 to 1933, the lowest total volume of external trade was 237,004,943 francs (1925), the highest 680,196,637 (1930). Imports, primarily wines, foodstuffs, and miscellaneous supplies for fishing vessels are supplied chiefly by Canada, the United States, and France. The decline is attributable to several factors: unsettled world trade, revaluation, and the loss of the formerly profitable liquor trade with the United States. Efforts begun in 1935 to better the colony's economic condition were continued in 1937, when provisions were made for loans to shipping interests, but a 2,000,000 franc deficit for 1937 was officially forecast. The monetary unit is the French franc (value: 3.4¢ U.S.), but United States, Canadian, and Newfoundland dollars circulate freely. Primary education is public, supplemented by two parochial secondary schools.

**Sakhalin,** a long, narrow island in the North Pacific, area 24,560 sq.mi., belonged to Russia until the Russo-Japanese War of 1904-05. Under the terms of the Peace of Portsmouth the island was divided into two approximately equal sections, the southern part being assigned to Japan, while Russia retained the northern. The 50th degree of latitude represents the boundary line. Japan occupied North Sakhalin during the period of civil war and foreign intervention in Russia. Soviet sovereignty was established in North Sakhalin in 1925 as part of the general agreement for the establishment of normal diplomatic relations between Japan and the Soviet Union. At the same time Japanese companies received long term concessions for the exploitation of oil and coal deposits in North Sakhalin. There have been frequent disputes about the interpretation of these concession agreements; but there has been no border friction, as along the Manchoukuo-Siberian frontier. North Sakhalin has been included in the general Soviet plans for an industrialized and self-sufficient Eastern Siberia and emigration to this remote outpost of the Soviet Republics has been encouraged. Japan has been equally energetic in developing its part of Sakhalin. The forests have, indeed, been too ruthlessly exploited; and destructive fires, encouraged by the dry summer climate, have depleted the timber stands which supply pulp for Japan's large paper industry. There are valuable fisheries of herring, trout, salmon, cod, shellfish and other marine products and the reserves of coal are estimated as high as 1,500,000,000 tons, although present annual output is only a little over 1,000,000 tons. The Mitsubishi Company is carrying on experiments in distilling oil from

coal at Naihoro, on the western coast of Sakhalin. Colonization from Japan Proper is encouraged, but with only moderate success. The population of the Japanese part of Sakhalin is about 336,000.

(W. H. CH.)

**Sales:** see RETAIL SALES.

**Sales Tax.** The general sales tax was introduced into the fiscal system of the various political subdivisions of the United States during the depression of the 1930's. Despite the stubborn resistance which met its introduction, it has gradually expanded, both in area and in the size of the income which it yields. It may fairly be said to have found a place in the American fiscal system which promises to be enduring. There are no less than 28 States that have some form of sales taxes; and the number of States having the modern type of sales tax has been increased by two during the year 1938. In States where the tax previously enacted expired during 1937, it was renewed, without exception.

Whatever hope there was for a marked reduction in the number of States and municipalities which impose this form of tax has been blasted for the present by the advent of the business recession which began in the latter part of 1937. The sales tax is ideally suited to raising revenue under emergency conditions. It was introduced into the United States during the economic catastrophes of 1932 and 1933, for the reason that the general property tax had broken down. The defect with that tax was that while it can be levied, its collection in times of depression is another matter. The sales tax solves that problem at a stroke. It makes one's income well-nigh useless unless he pays the tax. For the expenditure of income has, as a condition inseparable from the act of spending, the payment of the tax. There is no such thing as evading the sales tax. It is a safe prediction that we shall see a further expansion of the sales tax and an increase in its rates if the present business recession continues for any con-

Summers

"MISTER X," as Summers sees him in *The Cleveland News*

siderable length of time. One of the defects of the sales tax is that it is highly expansible. Since it must be paid as a condition to the expenditure of one's income, it is possible to impose high rates without greatly checking the volume of sales, and so the collection of taxes.

The one form of evasion which has been met in the administration of the tax in the United States takes the form of purchases outside the jurisdiction in which tax is levied. To meet this difficulty a number of the States have resorted to "use" taxes. Most of these are modelled upon the California tax, where, since July 1, 1935, a use tax of three per cent upon the "storage, use, or other consumption . . . of tangible personal property," has been imposed. Exempt from this tax are all goods subject to the retail sales tax and all goods specifically exempted from that tax. The tax, thus, is applicable only to goods purchased outside the State which would be subject to the retail sales tax if purchased within the State. The tax is levied upon the consumer, who must file quarterly returns showing amounts of property purchased and subject to the use tax.

A final and important defect of the sales tax is that it bears unjustly and with undue severity upon those who are least able to pay. It violates practically every principle of justice in taxation. This is true to such a degree that its employment can be vindicated only by the most dire necessities of fiscal and social emergencies. (See also TAXATION.) (D. F.)

**Salt.** Because of its domestic uses, the production of salt is one of the most widely disseminated of the mineral industries. Scarcely any country on the face of the earth, civilized or uncivilized, fails to contribute in some degree to a total output that was estimated at 31,000,000 metric tons in 1935. The United States leads in production, with 23% of the total, followed by the Soviet Union, 14%, the United Kingdom 9%, China 8%, Germany 8%, India 6%, France 6% and Italy 4%. These countries represent the more heavily industrialized areas, and those of greatest density of population, and contributed 78% of the world output. The extent to which industrial uses affect salt consumption is emphasized by a comparison of the United States and China, the per capita consumption of the United States being about 80 times that of China. (G. A. Ro.)

**Salvador, El,** a republic on the Pacific coast of Central America; language, Spanish; capital, San Salvador; president, General Maximiliano Hernández Martínez. The area is 13,176 square miles. The population according to the June 1937 census was 1,631,967, of whom 621,907 were urban residents. The leading cities with 1930 populations are: San Salvador, 96,447; Santa Ana, 75,860; San Miguel, 40,349; Nueva San Salvador, 30,447. The dominant note in El Salvador in 1937 was one of stringent economy. In February a trade reciprocity agreement with the United States was signed. In July, the government announced withdrawal from the League of Nations "for financial reasons" (effective in 1939).

In September the president-dictator stirred great enthusiasm when he formally enunciated the policy of never contracting a new loan. Salvadorean imports totalled 20,122,963 colones and exports 25,251,170 colones in 1936. In the fiscal year 1936-37 imports from the United States increased 63.3%, but exports rose only 7%. El Salvador has 604 kms. of railway. Coffee comprises 70-80% of the exports. The monetary unit is the colon (value: 40¢ U.S.). The 1936-37 budget was balanced at approximately 22,000,000 colones. The public debt in 1936 was 42,269,000 colones, a reduction of over 3,000,000. In 1935 there were 1,200 primary and 30 secondary schools, with total enrolment of 82,468, and one university.

**Salvation Army.** During 1937, at the 2,064 American centres of work, an evangelical and emergency relief program of extraordinary dimensions occupied the time and attention of Salvationists who found little diminution in the demands made upon them by sufferers from unemployment and kindred social ills. Ninety thousand converts were recorded by the organization during the year; 716,584 indoor meetings and 163,991 open-air gatherings were conducted; 4,631 officers and cadets direct the activities of the organization throughout the country. There are 35,919 local officers and bandsmen; of 2,128 inquiries received by the Missing Persons Bureau, 845 individuals were located.

An important phase of the organization's many-faceted program is its character-building activity, carried on through special departments which provide young people with suitable companionships, social programs, helpful class work, and meetings for their development.

The Salvation Army work in America is divided into 4 territories, Eastern, with territorial headquarters in New York, Central, with headquarters in Chicago, Southern, with headquarters in Atlanta, and Western, with headquarters in San Francisco. A commissioner is in charge of each of these territories, while a National headquarters in New York under a National secretary, serves to unify the work of the country.

**Great Britain.**—Claiming the world as its "parish," the Army now has centres and outposts in 95 countries and colonies and comprises 17,567 corps, for the staffing of which there are 26,877 officers and cadets, 116,048 local officers, 51,329 bandsmen, 82,100 songsters, 35,770 corps cadets, and nearly 10,000 persons without rank, wholly employed. It would not be possible to calculate the numbers who follow the banners.

During 1937 the leader of the Army, General Evangeline Booth (b. 1865), daughter of the first General, William Booth, visited India, where she took the Indian name "Prema" (meaning love and affection), Ceylon, and the Netherlands Indies. She was present at the coronation ceremony at Westminster Abbey, and among the guests at a reception at Buckingham Palace. For the observance of the 25th anniversary of the death of the founder, the general entertained 1,500 children and 500 mothers from the poorest parts of London.

In England, the plight of Spanish refugees brought some hundreds of Basque children under the care of the Army; whilst a new isolation block at the Mothers' Hospital, Clapton, London, was opened by Lady Baldwin.

In round figures, the self-denial effort in British territories produced in 1937 £156,000.

**Samoa** comprises American Samoa and the mandated territory of Western Samoa.

**American Samoa,** lying between 167° W. and 171° W. long., and between 5° S. and 7° S. lat., comprises the island of Tutuila (40 sq.mi.) and five other islands (total, 16 sq.mi.). Population (1937), 11,908. Seat of government, Pago Pago (Tutuila), a magnificent harbour, being a regular port of call for trans-Pacific mail ships, and a U.S. naval station.

**The Mandated Territory,** formerly a German possession, lies between 171° W. and 173° W. long., and between 6° S. and 7° S. lat. It comprises the islands of Savaii (703 sq.mi.) and of Upolu, with its small adjacent islands (430 sq.mi.). Population (1936): 610 Europeans, 2,453 half-castes, 502 Chinese, 51,131 Samoans, and 82 other islanders. The mandate is held by New Zealand, the acting administrator being A. C. Turnbull. Capital, Apia (Upolu). Revenue (1935-36), £111,867; expenditure, £100,736. Exports (1936), £263,255, chiefly copra, bananas, and cacao; imports, £167,020.

**Sand and Gravel.** The leading uses of sand and gravel are in building construction and road paving; these account for 80% of the sand and 90% of the gravel consumption of the United States; the only other important use of gravel is as railroad ballast, which takes all but 1% of the remainder, but with sand, ballast accounts for only 2%, and there are a number of industrial uses. The total production increased by about one-half in 1936, as compared with 1935, reaching 60,303,000 short tons of sand and 118,026,000 tons of gravel, against 33,161,000 tons and 74,595,000 tons in 1933, and 99,253,000 tons and 123,319,000 tons in 1929.

The combined output of sand and gravel in Canada declined from 28,548,000 short tons in 1930 to 11,739,000 tons in 1932, increased to 21,213,000 tons in 1935 and dropped to 19,847,000 tons in 1936. Production in the United Kingdom is less than in Canada, amounting to 15,611,000 long tons in 1935.

(G. A. Ro.)

**Sand Island:** *see* MIDWAY ISLANDS.

**San Francisco,** California, U.S., central port and financial centre of the Pacific coast, known as "The City by the Golden Gate"; area, 42 sq.mi.; population according to the U.S. census of 1930, 634,394, estimated Jan. 1, 1938, 739,746. Of the city's population, 235,298 were (1930) native whites of native parentage, or 37.1%; 206,285 native whites of foreign or mixed parentage, or 32.5%; 153,386 foreign born whites, or 24.2%; 39,425 Negroes or of other races, or 6.2%; 338,033 males and 296,361 females.

**History.**—The mayor in 1937 was Angelo B. Rossi, native Californian; legislation is vested in 11 supervisors functioning under a charter, which embodies fundamental rule for the only joint city-county in the State of California. Interest in civic affairs was evidenced by a vote of 176,200 out of a registration of 290,000 in the last municipal election. The judiciary consists of Superior and Municipal courts in which tenure is elective and for six years, and the city houses the State Supreme Court, despite the fact that the State capitol is at Sacramento.

The early part of 1937 witnessed conclusion of a 98-day strike of maritime workers that entailed actual monetary loss in excess of \$200,000,000 and ranging upward to twice that sum in commercial intangibles. The lesson prompted a group of 43 business men to seek, by amicable discussion, prevention of future strikes. As 1938 arrived, they had laid the groundwork, although still in nebulous form, in conjunction with labour representatives. In the meantime, the San Francisco Industrial Association aided in effecting peaceful settlement of four-fifths of the threatened strikes, and the city finished the year with a record of 36 actual work stoppages and consummation of 137 collective bargaining agreements.

**Education.**—There are 72 elementary and 21 high schools in the public system, and numerous parochial educational institutions, while the city is the home of the University of San Francisco, San Francisco Junior college, branches of the University of California and of Leland Stanford, Jr., university, located respectively across the bay at Berkeley, and 30mi. southward at Palo Alto.

**Commerce.**—Over the harbour's 50 piers passed 31,479,844 tons of commerce in 1937, including a goodly share of the State's total agricultural output of \$481,219,000. The last barrier to the city's peninsular isolation was eliminated during 1937 with completion and opening of the Golden Gate bridge, connecting with coastal counties northward and complementing the San Francisco-Oakland bay bridge, completed the year before to the neighbouring communities of the East bay section. Increase in traffic

because of the bridges intensified an already serious traffic control problem, not yet settled. Voters rejected a proffered solution in the form of a \$50,000,000 subway system, reflecting an uncertainty of general dimensions.

(C. H. Ro.)

**San Francisco-Oakland Bay Bridge:** *see* BRIDGES.

**San Gabriel No. 1 Dam:** *see* DAMS.

**Sanger, Margaret:** *see* BIRTH CONTROL: *Bermuda*.

**San Marino,** a tiny republic of 38 sq.mi. in the Apennines, S.W. of Rimini, entirely surrounded by Italian territory, ruled by a Grand Council and two regents appointed therefrom to exercise executive powers. Population (1932), 13,950; the capital (of the same name) has about 1,700 inhabitants. Building stone and wine are exported; there is an electric railway to Rimini. Italian currency is in use, but there is a local silver coinage.

**Santo Domingo:** *see* DOMINICAN REPUBLIC.

**"Sapper":** *see* MCNEILE, CYRIL.

**Sapphire:** *see* GEMS AND PRECIOUS STONES.

**Sarawak,** coastal strip on the north-west coast of Borneo (*q.v.*), an independent state, protected by Great Britain, ruled by Rajah Sir Charles Vyner Brooke (succeeded 1917). Area, *c.* 50,000 sq.mi.; population (est.) 450,000, of mixed races, Malay, Dyak, etc., largely Mohammedans. Some educational activities are carried on by mission schools. The capital is Kuching (pop. 25,000). Sago, rubber, and rice are grown; and coal and oil are worked in considerable quantities. There are numerous wireless stations, and regular steamer communication with Singapore; roads have been constructed in the Kuching neighbourhood. Revenue in 1936 was about £641,000 and expenditure £514,000, the former being raised mainly from customs, oil and timber royalties, lands, and an opium monopoly. The exports and imports for the same year were valued at £2,865,000 and £2,131,000 respectively. A police force of about 900 is officered by Britishers.

**Saskatchewan,** the middle of three Prairie Provinces of Canada, was created a Province, Sept. 1, 1905. It has a total area of 251,700sq.mi.; population, 931,000 (1936 estimate). The present Liberal Government, William J. Patterson, Premier, holds 50 out of the 55 seats. The opposition party is Farmer-Labour.

Widespread drought extending from the south border to north of Saskatoon characterized the year. The total farm value of field crops for 1937 was estimated at \$47,404,000 by the Dominion Department of Agriculture, as compared with \$148,233,400 in 1936. There is practically no other source of income. As a result, not less than 400,000 persons are on direct relief. The Dominion Government has come to the assistance of the Provincial Government, in some areas bearing the total cost of relief, in others a part. Lack of fodder for livestock has necessitated the shipping out of cattle and horses. Only sufficient livestock may be retained for family maintenance. The Dominion Government has enlarged its program under the Prairie Farm Rehabilitation Act in an attempt to prevent the recurrence of drought over such wide areas.

(J. T. C.)

**Saudi Arabia:** *see* ARABIA.

**Savage, Michael Joseph** (1872— ), New Zealand statesman; son of Richard Savage, farmer at Benalla, Australia, where he was born on

March 7, 1872, and educated at the State school there. Beginning life as an employee in a general store, he worked from 1893 on an irrigation scheme in New South Wales, and from 1900 as a miner in Victoria, afterwards becoming manager of the Rutherglen Co-operative Company. He arrived in New Zealand in 1907, started work in a flax mill, and soon became active in the labour movement. After twice standing at parliamentary elections, he was returned for Auckland West in 1919, retaining that seat with increasing majorities in 1925, 1928, 1931, and 1935. He became national secretary of the N.Z. Labour party, its deputy leader (1922), and its leader (1933). On Dec. 5, 1935, after the general election, he was appointed first labour prime minister of the Dominion, holding also the portfolios of external and native affairs, with charge of some minor departments. In 1936 he was made a privy councillor. In 1937 Mr. Savage visited London to represent the Dominion at the Coronation and in the same capacity attended the Imperial Conference (May 14—June 15).

**Savings Banks.** In Europe as well as in the United States there has been, in general, a growth in the volume of savings bank deposits and in the number of depositors during that portion of the year 1937 for which statistics are available.

Assets of the 551 Mutual Savings Banks in the United States increased \$128,700,000 to a total of \$11,588,000,000 during the six months ending July 1, 1937. Deposits credited to 14,759,246 accounts reached a peak of \$10,207,000,000 and the combined surplus was \$1,323,000,000 or 13.5% of total deposits. Dividends averaged 2½% during the year, a slight decrease from the rates prevailing in 1936.

In Great Britain's 650 Trustee Savings Banks offices on Oct. 31, 1937 there were 3,500,000 accounts with total funds of £270,000,000. This sum represents the combined assets of all three departments: Ordinary, Special Investment and Government Stock Register. Thirty-six new branch offices were opened during the year, the largest expansion of new offices in the 120 years of the Trustee Savings Banks' history. The interest rate on Ordinary accounts continued at 2½%, and deposits in this department increased more than £11,000,000. In Great Britain's Post Office Savings Banks credits to depositors exceed £632,000,000 with 10,600,000 active accounts. In the United States, as well as Great Britain, the increase in the volume and number of savings accounts was stimulated by the general improvement in economic conditions.

In America, mortgage loans, the customary major outlet for savings funds, were available only in small quantities, because of continued sluggishness in the building industry. Foreclosures of mortgages have abated and a general improvement was noted in the status of existing mortgage investments. Purchases of U.S. government securities continued as the principal investment of current funds. In Great Britain no investments are made by Trustee Savings Banks in mortgages but the Special Investment departments lend considerable sums to the local authorities for municipal improvements. The amount of such loans outstanding is £85,000,000. In both English-speaking countries the savings institutions continue to develop school savings, safe deposit departments, and other savings facilities by educational activities and an increasing use of advertising including the radio, especially in the United States.

On the Continent and especially in Scandinavia, 1937 marked a visible improvement in savings bank activities. Growth was recorded in Germany and in Italy, and with an interruption due to the absorption of a large government loan, and adjustments following revaluation of the currency, also in France. Progress was made in tightening of savings bank regulation by public authori-

ties and in fostering the special training of savings bank employees. In Denmark a new savings bank law came into effect on July 18th.

(HE. BR.)

**Scandinavian Literature.** Among the poets in Norway who must be mentioned are Hovden with *Dikt i utval*, Schøyen with *Viddenes folk*, Vogt with *Et liv i dikt*, Wildenvey with *Samlede dikt*, and Øverland with *Den røde front*. Published plays included Krog's *Opbrudd*, Tu's *Seinsumar*, Borgen's *Høit var du elsket*, Egge's *Manns ære*, and Grieg's *Nederlaget*.

The *Norsk litteratur historie*, begun in 1924 by Bull, Paasche, and Winsnes, was completed in 1937 by the appearance of Vol. V.

Among the numerous novels, the most vital were, perhaps, Elster's *Helg*, Hagen's *Refsing*, *Den gamle pionér*, Scott's *Ferdinand*, Sigrid Undset's *Norske helgener*, Anker's *Små avsløringer*, Braaten's *Fugleburet*, and Fangen's *Allerede nu*.

**Sweden.**—There was some rather striking poetry. Lagerkvist produced *Genius*, a visionary prophetic book. Gullberg's *Att Övervinna Världen* raised him to the front rank. Siwertz's *Minnas*, Berit Spong's *Dam med Parasoll*, K. G. Hildebrand's *Var-dagsjämning*, and O. Lagercrantz's *Den Enda Sommaren* are all works of note. Successful memoirs included H. Hamman's *Minnen*, V. Heiser's *En Amerikansk Lakares Odyssé*. A few travel and adventure books rose above the average, namely, C. Belfrage's *Bort Från Alltihip* and A. Engström's *Med Kaaparen Till Sydafrika*. Outstanding successes among novels were Gustaf-Janson's *Stora Famsnen*, Hammenhög's *Anna Sevardt*, Hedberg's *Grop åt Andre*, and Swensson's *Hjalmar Willen och hans Klass*.

**Denmark.**—Poetry suffered a great loss in the death of the poet Thøger Larsen, but several important collections appeared, in particular K. Andersen's *Lanterner*, Marie Bregendahl's *Filtret Høst*, and J. V. Jensen's *Paarskebadet*. Noteworthy novels were K. Bjarnhoff's *Livets Elskere*, K. Blixen's *Den afrikanske Farm*, and J. Buchholtz's *God lille By*.

Historical works included Vilh. La Cour's *Danmarks Historie*, G. Hatt's *Landbrug i Danmarks Oldtid*, and Th. Thaulow's *Kong Christian og det danske Folk*, 1912–1937. The most important biographies were perhaps M. Nexø Andersen's *For Lud og Koldt Vand*, J. Kammergaard and N. Anesen's *Svømmeturen*, and J. E. Lang's study of *Henry George*.

(X.)

**Iceland.**—Among the volumes of poetry were J. Úr Vör's *Ég Ber Að Dyrum*, J. Úr Kötlum's *Hrímhvíta Móðir*, and G. Frímann's *Störin Syngur*. Books of essays included: G. Finnbogason's *Mannfagnaður*, and a collection of essays and short stories by various authors, entitled *Rauðir Pennar*. Among the novels were Laxness's *Ljós Heimsins*, two by K. Guðmundsson, *Uxinn Og Gyðjan* and *Lampinn*, and H. Halldósson's *Hraun Og Malbik*.

(S. L. EN.)

**Schacht, Hjalmar Horace Greeley** (1877– ), German economist, personal financial adviser to the Führer, president of the Reichsbank and minister of economic affairs from July 1934 till November 1937, when he voluntarily resigned (the first Nazi minister to do so), and was made a Reich minister without Portfolio; born in Schleswig, he was educated in Germany, obtained his doctorate in Berlin, entered a banking house, and by 1916 was director of the Darmstaedter and National bank. On the collapse of the mark (1923), he devised the "Rentenmark," thereby stabilizing the currency, and in 1924 became president of the newly-formed Reichsbank.

An opponent of autarchy, or self-sufficiency, Dr. Schacht, in April 1937, declared that Germany wished to buy cheaply abroad rather than manufacture expensively at home; in May at Paris,

after opening the German pavilion at the exhibition, he asked that, in return for a firm guarantee of European peace, a return to a reformed League, and an open discussion on armaments, Germany should be allowed an outlet for colonial activity; but in August he ceased to take part in the work of his ministry, and on November 26 resigned, as he did not entirely agree with General Göring's four-year plan, though he was prepared to carry out Hitler's economic policy.

**School of the Air:** *see* BROADCASTING.

**Schuschnigg, Kurt von** (1897— ), Austrian statesman, born at Riva in what was then "Italia Irredenta"; served in the World War, and was made prisoner by the Italians in 1917. He entered politics in 1927, and in 1932 was minister successively of education and of justice under the Dollfuss régime, and founded the Sturmscharen, a militant organization of Catholic youth. In 1934, he became chancellor of Austria, consolidating his position two years later by dispensing with his vice-chancellor, Prince Starhemberg. In March, 1937 Dr. von Schuschnigg assumed the portfolio of public security, after dismissing Herr von Sturmer, the previous minister. On April 23, he met Mussolini at Venice to discuss political and economic co-operation between his country and Italy. On Oct. 8, in an important speech at Vienna, he summarized the policy of his régime, and appealed to Germany for the suppression of propaganda by Austrian émigrés. An international crisis developed when Chancellor Schuschnigg conferred with Adolf Hitler on Feb. 12, 1938 and on February 15 announced the appointment of a cabinet partly pro-Nazi and the freeing of all political prisoners. Austria's capitulation to Hitler's demands marked a triumph for the policy of German expansion in central Europe.

**Science Museums.** The Buffalo Museum of Science opened a 16-week course in museum training. Mr. Philip Fox was elected director of the Museum of Science and Industry, Chicago. Professor Allen, of Cornell university constructed two nature groups of birds which sing and go through natural life-like movements by means of sound films and electrically driven mechanisms. Mr. Frank Tose, in charge of the exhibits at the California Academy of Sciences, San Francisco, was selected to represent the Carnegie Corporation of New York in a trip to Australia and New Zealand to introduce the latest methods of preparation of natural history habitat groups in public museums.

**Great Britain.**—At the Science Museum, London, an important temporary exhibition on television was held. The exhibition showed the development of television since the discovery of selenium in 1817 and the present state of progress. Other temporary exhibitions were of electric illumination and timber. A marine screw-propulsion centenary exhibition showed pioneer experimental work, subsequent development and present practice. The centenary of the London and Birmingham and Grand Trunk railways formed the occasion for a railway exhibition.

The Albany Museum at Grahamstown, South Africa, built a new wing of two rooms, to contain marine collections, history, and prehistory sections. Mr. Matthews retired from the Australian Museum, and Mr. McCarthy, assistant in anthropology, visited the Dutch East Indies and Malay States, to study prehistory and to take part in excavations at the island of Celebes, under Professor van Steen Callenfels. The director of the commercial and industrial museum of Montreal, Dr. Henry Laureys, published a booklet on the museum collections, including the recently estab-

lished permanent exhibition of British Empire products.

**Europe.**—The Brussels Museum acquired unique specimens of the Wealden dinosaur iguanodon, and installed them in two airtight cases. The bones were specially treated and mounted on iron frames. The Moscow Palaeontological Museum was moved to Moscow from Leningrad and opened for the International Geological Congress in July 1937. A museum recently founded at Lennep, Prussia, the birthplace of Wilhelm Conrad Röntgen, illustrates the significance of X-rays and the development of Röntgen technique. The German Röntgen Society founded a Röntgen Institute at Munich, containing a museum and library. The German Museum at Munich opened a new public hall and library. The museum of the Conservatoire National des Arts et Métiers, Paris, acquired a model of the engine Pacific Compound 1922-33; a graphorama, invented in 1892 by M. le Baron; a Caruelle piston pump; a Daubron centrifuge pump, and a bicycle of 1886. (V. R.)

**Scotland,** northern portion of the mainland of Great Britain, with many adjacent smaller islands; governed as an integral part of the United Kingdom, being represented in the British Parliament by 16 representative peers and 74 members in the Commons. Capital, Edinburgh.

**Area and Population.**—Area: 30,406 square miles. Population: (census 1931) 4,842,554; (estimated 1936) 4,966,000 (density, 159 per square mile).

**Religion.**—The (Presbyterian) Established Church of Scotland, with 1,288,500 communicants, is that of the majority. There are some 610,000 Roman Catholics, and about 127,000 members of the (Protestant) Episcopal Church.

**Language.**—English, save for 0.15% of the population (census 1931) who speak Gaelic only; 2.69% speak both languages.

**Educational System.**—(*See* GREAT BRITAIN AND NORTHERN IRELAND, UNITED KINGDOM OF.) There are four universities, at St. Andrews, Edinburgh, Aberdeen, and Glasgow, with about 650 full-time professors, lecturers, etc., and 13,700 students.

**Leading Cities.**—The largest (and second largest in the British Empire) is Glasgow, population (1931) 1,088,417, followed by Edinburgh (438,998), Dundee (175,583), and Aberdeen (167,259).

**History.**—King George VI held court at Holyrood-house, Edinburgh, in July. In October a committee (chairman, Sir John Gilmour) reported recommending a reorganization of the executive administration into four co-equal departments of health, education, agriculture, and home affairs, to operate as far as possible from Edinburgh, under the secretary of State. Two by-elections in Glasgow (at Hillhead and Springburn) left party representation unchanged, being won by a Conservative and a labour supporter respectively, and the death in November of Mr. Ramsay MacDonald (*q.v.*) created a vacancy in the Scottish universities division which, at the end of year, had not been filled. A committee on the Scottish marriage laws under Lord Morison reported in January, recommending the abolition of all irregular ("Gretna Green") marriages and the introduction of a new and simplified form of civil marriage. In April the Duke of Gloucester laid the first stone of new Government buildings at Calton Hill, Edinburgh. Elaborate preparations were pushed forward for the Empire Exhibition to be held in Bellahouston park, Glasgow, in 1938.

**Scotland Yard:** *see* POLICE.

**Scottsboro Case,** in which nine Alabama Negroes were originally sentenced to death on charges of rape, entered its sixth year in the courts under somewhat more

favourable circumstances than had formerly prevailed. A changing attitude among the thoughtful white element was reflected in the altered tone of editorials in the State, notably one which appeared in the *Montgomery Advertiser* and was reprinted with approval by other journals. Increasing support developed for proposals of a compromise settlement. And some sort of agreement seems to have been reached between the prosecution and the defense attorneys though its terms were in the end differently interpreted by the opposing sides.

The year's chronology of formal events began on May 27 when the local defense attorney, Clarence L. Watts, petitioned the State Supreme Court to set aside Heywood Patterson's 75 year sentence and order a new trial. On June 14 this petition was denied. A further petition was later made to the Supreme Court of the United States; but it too, on Oct. 26, was denied—Justice Black taking no part in the decision. Meanwhile the new trials previously ordered for the remaining eight men began on July 12 with Clarence Norris, who four days later was again sentenced to the electric chair. Execution of this sentence, subsequently set for Sept. 24, was automatically stayed by the filing of notice of appeal. The State dropped the death plea against Andy Wright, and on July 21 he was accordingly convicted and sentenced to 99 years in prison. Charlie Weems, next in order, received a sentence of 75 years. Then on July 25 the attorney general nolle prossed the main indictments against the remaining five (Eugene Williams, Roy Wright, Olen Montgomery, Willie Robeson, and Ozie Powell). But Powell pled guilty to a secondary charge of assault on a deputy sheriff and was sentenced to 20 years in prison. Motions for new trials for Norris, Wright, and Weems were denied on Aug. 28 by the trial judge.

**Sculpture.** Federal sponsorship of sculpture projects and plans for the extensive use of sculpture in connection with the 1939 New York World's Fair were prominent aids in the promotion of sculptural activity in the United States during the year 1937. The value of the former was felt in numerous localities where sculptors were assisted in the continuance of their professions through government subsidy and special assignments for works for public buildings. The World's Fair program spurred activity by enlisting the services of a number of artists prominent in the sculpture field.
